THE IRON AGE

THURSDAY, JULY 5, 1888.

Steam and Its Rivals.

Prof. Robert H. Thurston, writing in the *Forum* for May, on the various attempts which have been made to supplant steam by some other fluid for working engines, says:

A few years ago, disappointed in the hope of being allowed to make a careful and crucial trial of the best recent devices of this seductive class for the benefit of a wealthy friend, who was ready, if so advised, to "take a little stock," I had a very complete study made of the several

cent. better—quite too slight a difference to be considered, and probably much more than compensated by the greater waste by friction to be met with in the larger machine. Comparing them between the temperatures customary in the steam engine as ordinarily operated the results were essentially the same, and when studied as working fluids, with the same back pressures in all cases, substantially the same results were again found. The final conclusions were beyond doubt that the limit being taken as the admissible pressure, steam is the most efficient of all, and

dous waste which is apparently unavoidable in our present methods of utilization of the grand source of artificial power, the energy of heat motion.

Improved Tail-Rope Engine.

Through the courtesy of Messrs. I. A. Finch & Co., of Scranton, Pa., we are enabled to present in this issue engravings of their improved tail-rope engine. It is of the double cylinder reversing type, the cylinders measuring 12 inches by 20

Fig. 1.—General View.

IMPROVED TAIL-ROPE ENGINE, BUILT BY MESSRS. I. A. FINCH & COMPANY, SCRANTON, PA.

vapors best adapted for such use, thus securing a correct scientific comparison of the possibilities, if not of the practicalities, of the several presumptive rivals of steam as a motor. Comparing alcohol, ether, carbon-disulphide (dipulphide of carbon) and chloroform, the most promising of the available fluids, with water and its vapor, steam, it was found that, as the well-known laws of thermo-dynamics indicate, all were of precisely equal efficiency if worked in perfect engines within the same range of temperature, with no waste occurring other than that which has already been described as unavoidable. If worked, in each case, through the range of pressure familiar to us as employed in the steam engine, it was found that steam required the smallest engine to do a given amount of work. It was also the most economical, with the single exception of chloroform, which was a fraction of 1 per

cent. better—quite too slight a difference to be considered, and probably much more than compensated by the greater waste by friction to be met with in the larger machine. Comparing them between the temperatures customary in the steam engine as ordinarily operated the results were essentially the same, and when studied as working fluids, with the same back pressures in all cases, substantially the same results were again found. The final conclusions were beyond doubt that the limit being taken as the admissible pressure, steam is the most efficient of all, and

inches, and is built in the most substantial manner, with every provision for high speed and severe duty. The links, as shown in Fig. 2, are of the solid pattern, sliding in blocks provided with gun-metal slides, and having screws and jam-nuts for adjusting and taking up lost motion. The cross-head slides, connecting rod and valve-stem boxes are of gun metal, with large wearing surfaces. The piston rods, valve stems, crank pins, crosshead pins and link pins are of steel. The main boxes are Babbitt-lined, bored and fitted thoroughly. The crank-shaft is of hammered iron, and all materials used in the construction of the engines are of the best possible quality. The bed-plates are made broad, and are strongly bracketed to receive and support the heavy stands on which rest the adjustable pedestals and boxes of the drum-shaft. This shaft is also of hammered iron, the diameter and weight depending

on the length of shaft required for the service. On this shaft, midway between the engine, is firmly keyed a spur-wheel 6 feet in diameter. This wheel is driven by a pinion on the engine shaft, the proportions being one to four. On each side of the spur-wheel is a cast iron drum running loose on the shaft, capable of winding 6000 feet of $\frac{1}{4}$ -inch steel wire rope. These drums are driven by friction clutches known in the coal regions as "umbrella frictions," a term of which the significance will become at once apparent by a glance at our engravings. These clutches are operated by screws at the ends of the shafts by means of the miter gears and shafts, which bring the hand-wheels of both drums convenient to the hands of the engineer. Fig. 3 clearly explains this. Each drum is also provided with a substantial brake, that of the left-hand drum being controlled by the right-

Steam Navigation.

The semi-centennial of transatlantic steam navigation, dating from the first voyages of the steamships *Sirius* and *Great Western*, in 1838, gives a special propriety and pertinency to a retrospective glance in which we gather for review the records of steam navigation since the year 1813, as culled from newspapers in the United States. As best serving this purpose we take a file of *Niles' Register* and find therein a notice of the launch of the steamship *Savannah*, built by Wm. H. Brown, of New York, at his yard on the East River, and which earned distinction by making the pioneer voyage across the Atlantic in 1819. The experimental efforts of Fulton and Livingston have a peculiar piquancy when considered from the standpoint of the contemporary ob-

Congress refusing to grant a mail contract which would be a fair offset to the heavy subsidy received by his British competitor—we may date the decadence of the American ocean marine.

The following extracts from *Niles' Weekly Register* begin with a reference to the successes of Fulton:

May 22, 1813.—Eight, and occasionally nine, steamboats are now used at New York for the transportation of passengers and goods to and from that metropolis. Several others are building. Used as ferry-boats they have almost suspended the necessity of a bridge over the Hudson by the safety, convenience and regularity of their passage. Three go to Albany, one to Amboy, one to Tappan, one to Hoboken, one occasionally to Elizabethtown (N. J.), and one is building as a packet to New Haven, Conn., besides those for ferries.

Fig. 2.—Side Elevation.

IMPROVED TAIL-ROPE ENGINE, BUILT BY MESSRS. I. A. FINCH & COMPANY, SCRANTON, PA.

hand lever and *vice versa*. Thus when the rope is winding in on the right-hand drum the left-hand drum, running loose, is paying out, and is under perfect control by means of the right-hand brake lever. Those brake levers, as shown in Fig. 1, have latches by which they may be set at any point, giving any degree of resistance desired. The lever shown between the brake levers is the reversing lever of the engines, and is substantially the same as the reversing lever of a locomotive. In Fig. 1 the throttle-valve is shown overhead, but in situations requiring it, as sometimes inside the mines where it is expensive to take down roofs, the throttle-valve and lever may be placed below.

These engines and drums are adapted to any situations where tail-rope engines can be used. They are simple and easily managed, and are not as costly as some of the complicated machines which have been brought out for this purpose. They are built in different sizes, the largest for which patterns are completed having 16 x 24 inch cylinders. They are compact, require little room, and are powerful and efficient machines.

server. And at this later day, when Buffalo, Detroit, Cleveland and Chicago are each the rendezvous of large fleets of iron steamships, and when the commerce passing through the "Soo" Canal compares favorably in point of tonnage with the entire foreign trade of the United States, it is refreshing to read of the wild antics of the savages who flocked to the banks of Lake Erie when they beheld the approach of the first steamer that awakened the solitudes with its screeches. Thus it happens that within the memory of men now living steam has gained the supremacy on all inland waters of the United States from the lakes to the Gulf, and on the ocean as well. Instead of a forest of masts encircling New York City, as in bygone years, we have only the occasional visits of mammoth iron-plated steamships as they flit to and fro between the hemispheres. Unfortunately, while Americans may glory in the achievements of Fulton, Fitch and Livingston, they have to deplore the disasters that befel the Collins line just at the critical moment when the American eagle seemed to have won in the contest with the British lion. From that reverse—in

June 4.—Letter to the editors of the *National Intelligencer*, dated Pittsburgh, April 22, 1814: This morning the steamboat *Vesuvius*, intended as a regular trader between New Orleans and the falls of Ohio, left Pittsburgh. A considerable freshet in the river renders it probable that notwithstanding the great size and draft of the vessel she will pass the falls without difficulty, after which she will meet with no obstruction in the rest of her passage. There is now on the stocks here just ready to be launched a boat adapted to the navigation of the Ohio above the falls which will be finished in time to meet the *Vesuvius* on her return from New Orleans at the falls. The boats are built by Mr. Fulton, under the agency of Messrs. Livingston and Lathrop, for companies who have vested very large capitals in the establishment. The departure of the *Vesuvius* is a very important event, not only for this place but for the whole western part of the Union, and its influences will be felt over the whole of the United States. In describing it, it is necessary to use the inflated language which, unfortunately for the credit of our trade, too often renders

real facts incredible, or at least lowers their importance by the manner in which they are puffed into notice. * * *

It does not require the ornament of metaphor to impress upon the public mind the incalculable advantage of an intercourse by water effected in large vessels, which move with certainty and rapidity through an extent of internal navigation embracing a space almost as large as the whole conti-

any further extent, as the navigation by steam was thought to be much on a footing as to practicability with the navigation by the reindeer in the Chancellor's park.

The steamboat Vesuvius went from Pittsburgh to Louisville, 767 miles, in 67 hours 25 minutes, equal to $10\frac{1}{4}$ miles per hour! The city of New York is enjoying immense advantages from these vessels, as

67 $\frac{1}{4}$ hours; from Shippingport to Natchez, 125 $\frac{1}{4}$ hours; from Natchez to New Orleans, 33 hours. Total from Pittsburgh to New Orleans, 227 hours.

April 22, 1815.—A large steamboat was about to be launched in England to run as a packet between Dover and Calais, and will no doubt do very well, as the one that plies from New York to New Haven, through the Sound, answers every expect-

Fig. 3.—Plan.

IMPROVED TAIL-ROPE ENGINE, BUILT BY MESSRS. I. A. FINCH & COMPANY, SCRANTON, PA.

ment of Europe, and comprising in it the productions of almost every climate. This intercourse, though now only in its infancy, must in a few years become of immense magnitude. When the late Chancellor Livingstone applied for his grant for the exclusive navigation by steam on the North River to the Legislature of New York for 30 years, on condition that he should actually accomplish it, a very sensible member of the Legislature told me that he could easily have had a grant of

packets and ferry-boats; loaded wagons are hourly seen in that city from Long Island and New Jersey. John L. Sullivan, of Boston, has obtained a patent for the use of steam-engine power in towing luggage-boats, being a new and useful application of steam engines, and put in practice by him on Merrimac River.

July 9, 1814.—Astonishing Passage.—The steamboat Vesuvius made the following passage from Pittsburgh to New Orleans: From Pittsburgh to Shippingport,

tation, even steering well by the compass, in case of fogs, notwithstanding the quantity of iron on board of her.

May 20, 1815.—The steamboat *Fulton* lately proceeded from New York through the Sound to Connecticut River and up that river as far as Middletown. She had a band of music on board. As the boat passed Petti Plague the musicians played the royal airs of "God Save the King" and "Rule Britannia" in compliment to the defenders of that place.

July 1, 1815.—By a letter from an officer of the steamboat *Enterprise* we are informed that her last trip from New Orleans to Natchez was made in four days—a distance of 313 miles—against the strong current of the Mississippi, without the aid of sails.

August 5, 1819.—Last Saturday evening the steam was first tried on the *Dispatch*, another steamboat lately built at Bridgeport and owned, as well as the *Enterprise*, by the Monongahela and Ohio Steamboat Company. We are happy to learn that she is most likely to answer the most sanguine expectations of the ingenious Mr. French, the engineer, on whose plan she is constructed. It is expected, when her works are in complete operation, she will pass through the water at the rate of nine miles an hour.

February 28, 1818.—The steamboats at New York have been successfully used in towing large and heavily laden ships into the harbor. One of them was towed against wind and tide at four miles an hour.

April 25, 1818.—Steamboats are multiplying on the Western waters. One is running between St. Louis and New Orleans.

July 11, 1818.—A steamboat of 320 tons, called "The United States," was launched at Baltimore on the 4th inst. She is the largest boat on the Chesapeake—145 feet in length and 27 wide.

August 15, 1818.—It is stated that a two-masted steamboat is nearly completed at Philadelphia to ply as a packet between that port and Havana.

August 22, 1818.—The *New Orleans Chronicle* gives us a list of 20 steamboats, carrying near 4000 tons, which trade from that port from the upper and adjacent country.

August 29, 1818.—A large steamship called the *Savannah*, and intended to ply between that port and Liverpool, under command of Captain Moses Rodgers, was launched at New York on the 22d inst.

September 19, 1818.—The first steamboat arrived at Kaskaskia on the ult. It was the *Franklin*, from New Orleans, in 18 days running. Erie, on the Lake Erie, was in like manner first visited by a steamboat on the 21st ult.

October 3, 1818.—The Erie steamboat, from Buffalo, arrived on her first trip to Detroit on the 27th August. The *Detroit Gazette* observes: "Nothing could exceed the surprise of the sons of the forest on seeing the Walking in the Water moving majestically and rapidly against a strong current, without the assistance of sails or oars. They lined the banks above Malden and expressed their astonishment by repeated shouts 'Tai-yon nichee!'"

October 17, 1818.—Inventor of steamboats, Mr. Chaumont, a naval engineer at Paris, has published a large work, entitled "The History of the Rise and Progress of Steamboats in America, England and France." In this work he tells us that Dr. Franklin, when in Paris, suggested the idea of steamboats to several of his acquaintances.

The *Register* of October 24, 1818, gives a list of 17 steamers, comprising 3642 tons, trading to New Orleans.

January 30, 1819.—The steamboat *Walking in the Water* is advertised to take a trip from Buffalo to Michilimackinac, to perform the entire trip in 12 days.

April 15, 1817.—The new steamboat Chancellor Livingstone, a packet between New York and Albany, is of 500 tons burthen, and cost \$110,000. Her average speed is estimated at 8 miles per hour.

August 30, 1817.—Oliver Evans announces his discovery of the possibility of constructing boilers "that cannot be exploded by the elastic power of steam to

any dangerous extent," the editor remarking that the "daily increasing importance of steam navigation and the weighty consequences that are depending upon it renders its safety the common concern of all the civilized world."

October 11, 1817.—A Louisville paper states that there are nine steamboats building on the waters of the Ohio and the Mississippi, which will complete the number of 20 on those waters.

December 20, 1817.—The steamboat Massachusetts has departed from Salem "on a voyage for North Carolina on Mobile."

The *Register*, in its supplements for 1815-16, copies from a report to a committee of the British House of Commons by the engineer of a steamboat called the *Thames*, 72 tons, arrived at London from Glasgow, the object of the trip being to ascertain the most "expeditious and the safest mode of conveying the mail to Dublin," as follows: "This voyage demonstrated that steam engines are applied to propel vessels at sea in all kinds of weather; that they have the peculiar advantage of going against winds and tides and in a calm, when another vessel could not at all proceed; would go at the rate of from seven to nine knots per hour; they are more secure than vessels with sails, as they cannot be lost on a lee-shore."

The *Register*, same date, copies from the *New York Columbian* as follows: "Wonderful traveling. The steamboat *Fulton*, Captain Dunker, sailed from this place on Sunday morning, after 9 o'clock; arrived in Albany in 20 hours; remained there 7 hours; left there on Monday, after 12 o'clock, and got back here in 19 hours, before 7 o'clock yesterday morning, thus having performed a passage from New York to Albany, a distance of 160 miles, and back again, besides stopping at the different landings, going and coming, in 46 hours—an occurrence, we presume, never equaled in this country. The whole distance was at least 320 miles, and was run without a sail up, or any advantage whatever from the wind, in 29 hours, making a general average of 8½ miles in an hour. (The engine was stopped over 20 times on passages, 8 of which, each way, were at regular landing places, and the weight on the safety-valve averaged less than 3 pounds during the whole time, when 8 pounds would have driven the boat 9 miles an hour.) Then or even seven years ago nothing short of supernatural agency was supposed capable of effecting what we now see accomplished by the genius of Mr. Fulton. Since the invention of balloons no human contrivance has given to motion and conveyance such speed and certainty, with equal safety and comfort as the establishment of steamboats, by which a person is now carried 160 miles in one day, and brought home the next, and performs his journey in about the same time it formerly required to go to Amboy, Sandy Hook, or any distance of 20 miles and back again. So astonishing and beneficial is this truly admirable American invention.

A Fast War Ship.—One of the fastest war ships of the world is undoubtedly the torpedo aviso *Greif*, of the German Navy, which on her recent voyage from Kiel to Wilhelmshaven attained a speed of 23 knots an hour. The *Greif* was launched in 1886, and was built, of steel, at the Germania Yard at Kiel, from designs by the German Admiralty. Her displacement is 2000 tons, and her engines have an indicated horse-power of 5400. From these figures and her exceedingly fine lines, which give to the vessel the appearance of a torpedo-boat of immense size, it will be seen that speed was the chief object aimed at in her construction. The *Greif*, consequently, may be looked upon as one of the fastest, if not the

fastest, vessel of any maritime power, if we except the *Ouragan*, of the French navy, and some foreign torpedo-boats built in English yards, and which beat her record. The entire space of the *Greif*—of which vessel the Germans may well be proud—with the exception of the space provided for crew and stores, is taken up by boilers, engines and coal bunkers. The vessel is of the class called torpedo-boat hunters, and to aid her in that service she is provided with two powerful electric search lights, two light guns of great range, and a large number of those bugbears of torpedo boats, revolver guns. The *Greif* has three smoke-stacks, and carries no sails, there being only two short lookout masts.

Another Submarine Tunnel Proposed.—The question of a tunnel between Sealand and Sweden, under the Sound, had not been heard of for some time till the other day the Royal Swedish Commissioners, who were examining M. Delangle's application for a concession, sent in their report to the Swedish Government. This exhaustive document winds up with the conclusion that a submarine railway between Sealand and Sconia would no doubt insure several advantages to the international traffic, but that, as the building of it would require a very considerable capital, and the paying of the interest on the cost for a long series of years would necessitate heavy subventions from both the Danish and the Swedish Governments, in addition to the profits of the traffic, which would be inadequate for this purpose, the proposal for this new way of communication be abandoned for the present; that should ever, under altered circumstances, the want or the desirability of a submarine railway come into prominence, it ought to be built on account of the State.

Shipbuilding on the Delaware.—The shipbuilding yards on the Delaware are crowded with work. At John Roach's yard at Chester is the mammoth sound boat *Puritan*, which will cost \$1,500,000, two gunboats for the United States Government, two steamships for the Ocean Steamship Company, of Savannah, and a steam yacht. Cramp's yard is full. The latest contract closed is one with Cramp & Sons by Boulton, Bliss & Dallett, New York coffee importers, for an iron passenger steamship for the Red D Steamship Line, to run between New York and Venezuelan ports. The new craft will be 264 feet long, 35 feet beam and 20½ feet depth of hold, with triple expansion engines and steam steering gear. The vessel will cost about \$200,000. Government work on the new cruisers recently contracted for by the Cramps will amount to over \$6,000,000. Several yards have been compelled to double their working capacity, owing to the large contracts recently entered into. Cramp & Sons have the cruisers *Newark*, at \$1,248,000; the *Baltimore*, at \$1,325,000; the *Philadelphia*, at \$1,350,000; the gunboat *Yorktown*, at \$455,000, and the dynamite cruiser *Vesuvius*, at \$250,000. In the merchant line they have a Clyde steamship for the New York and Jacksonville trade, to cost \$225,000; a Morgan liner in place of the lost steamship *Eureka*, to cost \$250,000, and a steamship for the South American passenger and coffee trade, to cost over \$225,000. In addition the firm have a lot of miscellaneous work in the building of engines and boilers for hulls built elsewhere. President Elijah Smith, of the Oregon Railway and Navigation Company, is having built at Neafie & Levy's works a large iron steamship for the Pacific Coast trade to cost over \$175,000. A number of iron tugs and steam yachts are being constructed at the same yard.

The Duty on Wire Rods.*

I am the bearer of a petition which I have the honor to present herewith, relating to the question of a reduction or any change in the existing duties on wire rods. The petitioners received only very brief notice that a hearing would be granted to parties interested in this industry, otherwise the petition would have been more complete and would have borne a greater number of names.

I not only represent the manufacturers and citizens of Joliet, who signed the petition, but I also represent the Joliet Steel Company, manufacturers of Bessemer steel, who are now building a wire-rod mill capable of producing 25,000 to 30,000 tons per annum, all of which will be for sale upon the general market, as the company are not manufacturers of finished wire.

Permit me briefly to review the position of this industry:

The United States consumes about 350,000 tons of wire rods per year, requiring about 420,000 tons of pig iron or 675,000 tons of iron ore to produce them.

Under the existing tariff laws, permitting the anomaly of a more expensive, smaller-sized wire rod—namely, No. 6—to be imported at a lower rate of duty than the larger size, No. 5, the industry of manufacturing wire rods in the United States has been retarded, and about one-third of the amount required by this country is annually imported. This would not be the case if the duty was adjusted equitably to the cost of manufacture, and, in that event, the people of the United States would be benefited by the raising of the additional iron ore, coal, limestone, &c., required to make the pig iron and by the conversion of the pig iron into the steel necessary to manufacture the home rods to supplant the imported. Reducing the matter to a merely local issue, can it be denied that the town of Joliet, and the surrounding country which supplies it with the necessities of life, would be better off if we had more diversified steel industries, instead of being limited, as we are at present, almost exclusively to the manufacture of steel rails? It is well known that railroad building in the United States fluctuates very widely. Hence in some years our mills lie partly idle and our men must submit to enforced idleness if we make nothing but rails. Such has been the case this year, when, in spite of reductions in the cost of raw material and labor, we have been unable to compete with the existing low price of foreign rails imported into California under the present tariff. Twenty thousand tons of foreign rails have already entered California this year, thereby taking the place of the product of a large American mill for one month, throwing out of employment for that period not less than 2000 men directly employed in the steel industry, exclusive of all those indirectly engaged in mining iron ore, coal, &c.

It has been our purpose for some years past to add other branches to our business, and only the uncertainty of tariff legislation and the low price of imported rods debarred us from undertaking the manufacture of wire rods at an earlier date.

What is the so-called "raw material" of the rod manufacturer—billets or small blooms? Can he procure them in this country at a price to enable him to compete with foreign manufacturers of steel wire rods? Emphatically, no! for the reason that it is impossible for a manufacturer at the present stage of development and at the present rates for labor in this country to transport the varied materials required in the manufacture of steel to any

given point and there produce a bloom or billet as cheaply as they can be produced abroad. The wire-rod manufacturer, therefore, pays for his raw material a much higher price than his foreign rival, and the necessary waste incurred in the manufacture of the finished product costs the wire-rod manufacturer the high price of the initial process (namely, billets), and, in addition, he has to pay very much higher wages in the rod mill than those paid by the German or English manufacturer.

It may be said that American ingenuity and the greater productive capacity of the American workmen counteract the drawbacks that I have named, but I can assure you that it is only the developments of American mechanical ingenuity in the processes of our rod mills and the cheapening of the costs of manufacturing steel in recent years that have made it possible to successfully embark in the manufacture of rods under the present rates of duty; at no lower rate of duty would the business be possible.

It has been claimed by wire manufacturers who have no rod mill of their own that they are at a disadvantage in comparison with wire manufacturers who make their own rods. It might with equal propriety be claimed that the rod manufacturers who do not convert and roll their own steel are unable fairly to compete with those who do. This argument might even be carried back to the ownership of a blast furnace and an iron-ore mine. Is that, however, a sufficient plea for handing over the market of the United States to the foreigner? Would the wire manufacturers have any good reason to expect that if our rod mills be closed or no further extensions be made, that the German manufacturer, having the market of the United States at his command, would reduce his price, or even continue to sell at the existing rates? If history is of any value, such an expectation is undoubtedly a snare. What is it save home competition that has reduced the selling price of iron and steel rails, sheet steel, nails and merchant steel of all kinds below prices ever touched before in this country?

It has also been claimed by interested parties—namely, importers or agents of foreign firms, that basic steel rods No. 6 are necessary to the well-being of American wire manufacturers and cannot be produced in this country. It would seem to be sufficient reply to this argument that upward of 200,000 tons of Bessemer steel wire rods have been successfully produced and made into wire in the year 1887 in the United States without any complaint arising as to the quality of the article manufactured.

It is not necessary for me to trouble you with tables of comparative wages paid here and abroad, because I believe it to be an already admitted fact that the compensation for labor in this country is from two to five times greater than in Europe, thanks to the beneficent results of protection which has fostered our magnificent and varied system of industries.

I respectfully urge, therefore, that you maintain a protective tariff sufficient to compensate the manufacturer for the disadvantages under which he presently labors, enabling him to continue paying the present favorable rates of wages, and also to permit the transportation companies to pay the men employed by them handsomely as they do now in comparison with the wages earned by their fellow workers abroad in transporting the mineral and manufactured products of foreign countries.

One of the attractions of the Brussels exhibition is a circular undulating railway, after the well-known type of the switchback railway.

Cost of Electric Street Cars.

The Fourth Avenue Street Car Company, notwithstanding the adverse vote by the Common Council, have decided to run their cars from Fourteenth street up to Harlem by their new device, the electric motor. Before deciding upon the change, however, the directors appointed experts to make calculations as to the ratio of cost, gain and loss in the three methods of propelling street cars. The following is the result:

	Electric.	Horse.	Cable.
Cost of cars.....	1	0.54	0.81
Motive power.....	1	1.45	1.06
Construction of roadway..	1	0.53	2.09
Depreciation and repairs..	1	1.47	2.04
Operating expenses (including wages).....	1	3.38	1.71
Totals.....	5	7.37	7.74
Average.....	1	1.47	1.55

There are now 60 electric street railways in the United States. The question is no longer concerning the success of the electric motor, but what kind of motor should be used—whether it shall be by continuous current or the storage batteries. The Fourth Avenue Company have selected the storage batteries and separate motors. A depot will be erected midway on the line of railway where the batteries can be recharged when necessary. It is expected that one set of batteries, eight on either side of the car, will run for two consecutive trips. Since the action of the aldermen, it is stated that the board, feeling the weight of public sentiment too strong against them, are disposed to reconsider their action.

Prices of Rare Alloys.—P. W. L. Biermann, of Hanover, Germany, who makes a specialty of the manufacture of metal alloys, has sent us the following quotations: F.o.b. Hamburg and Bremen, net cash: Aluminium metal, in lots of 100 kg., 49 marks per kg.; aluminium brass, 300 marks per 100 kg.; 2½ per cent. aluminium bronze, 300 marks; 5 per cent. aluminium bronze, 400 marks; 7½ per cent. aluminium bronze, 560 marks, and 10 per cent. aluminium bronze, 670 marks per 100 kg. He quotes 5 per cent. ferro-aluminium, 550 marks, and 10 per cent. ferro-aluminium, 650 marks; 1½ silicon bronze, 300 marks, and silicon bronze for conductor wire, 260 marks; 3 per cent. silicon copper, 550 marks, and silicon copper, running from 3 to 4 per cent., 650 marks. manganese copper, 30 per cent., is quoted 475 marks, while 4 per cent. manganese bronze, rolled, is offered at 250 marks, and 15 per cent. pure manganese bronze is quoted 290 marks. Metallic cadmium sells at 620 marks; phosphor-copper of 10 per cent. is quoted 320 marks, and for 15 per cent. material 450 marks, while phosphor-bronze sells at 190 marks. Nickel bronze, No. 200, is quoted 180 marks per 100 kg.; Wolfram metal, 94 to 98 pure, 400 marks; chromium, 1200 marks, and Rose's metal, melting at 195° celcius, 1500 marks, and Wood's metal, melting at 178° celcius, 1600 marks. A number of different alloys for brasses and Babbitt metal are also quoted, which are, however, of less interest than those named.

Among the labor organizations of the country is the International Brotherhood of Boiler Makers and Iron Ship Builders' and Helpers' Protective and Benevolent Union of the United States and Canada. The annual session of this body was held in Chicago recently. The following officers were elected: Thomas J. Curran, New York, president; Vaughn Morgan, San Francisco, vice-president; Charles Keiffer, Reading, Pa., treasurer, Philip Starkey, Chicago, secretary. The union adjourned to meet in New York in June, 1889.

*Argument by W. R. Stirling, presented before the Finance Committee of the Senate, June 18, 1888.

ROTARY SHAFT STRAIGHTENING AND POLISHING MACHINE, BUILT BY THE AKRON IRON COMPANY, AKRON, OHIO.

Rotary Shaft Straightening and Polishing Machine.

We present on this and the opposite pages elevation, plan and cross sections of a rotary shaft straightening and polishing machine, designed for 4-inch shafting, and recently built by the Akron Iron Company, of Akron, Ohio, for use in their works. They now employ three machines of this kind, the smallest in use straightening and polishing on an average per day 3000 feet of shafting of from $\frac{1}{4}$ inch to 1 inch in diameter. The part of the machine which straightens the shafting and which is termed a "flyer," B, is formed with hollow journals and is rotated by means of the pulley F. It is further provided with straightening blocks, arranged in alternate order on opposite sides of the axis. These blocks, E, are shown more clearly in Fig. 3, from which it will be observed that they are adjustable between the side bars of the flier and the chucks D by means of set-screws. The side bars, as shown, are slotted, enabling the chucks D to be adjusted and bolted as desired. The polisher C is also formed with hollow journals, and is rotated by means

Fig. 3.—Sectional End Elevation.

Fig. 4.—Cross Section of Polisher.

ROTARY SHAFT STRAIGHTENING AND POLISHING MACHINE.

of the pulley *f*. From Fig. 4 it will be seen that it consists of two hinged parts, which contain the polishing blocks, rubber cushions and metal followers. The polishing blocks are made of wood with the grain parallel to the axis of the polisher, and can be adjusted by means of nuts and screw bolts inserted in their outer ends. They are also to some extent, self-adjusting, by means of the rubber cushions just mentioned. When the hinged parts are closed the inner ends of the polishing blocks are brought to bear against the shaft to be polished. The two parts are locked by means of a hinged pin and thumb-nut, as shown in the cross section.

There are three sets of friction wheels, G, which perform the offices of feed rolls, one of them being between the flyer and polisher, and the other two at the ends of the machine. They are rotated simultaneously by the gearing H, consisting of worms and worm-wheels. The shaft to be operated upon is fed in at the left, and passes out at the right. The flier and polisher are rotated independently of each other, the directions being reversed in order to lessen the tendency of the shaft to turn or twist, and the rate of speed of the former, moreover, being much higher than that of the latter. Both, however, are exactly in line. The work of the machines, we understand, is highly satisfactory.

Italian engineers, we find it stated, have made use of a new principle for the propulsion of some of their fast gunboats and

torpedo catchers under construction. They have improved upon the twin screws of modern steamships by the addition of a third screw moved by a separate shaft and set of engines. The three screws are placed in the angles of a triangular pyramid. There is one on each side of the rudder, as usual, and the third is underneath, on a level with the keel-plate. It was claimed that the third screw increased the vessel's speed by fully a third, on account of the great gain in power from the deep immersion.

The Turner Steam Engine and Boiler.

Our English contemporary, *Industries*, devotes considerable space in a recent issue to illustrations and a description of a somewhat peculiar type of engine and boiler recently designed by Mr. Henry Turner, of Liverpool. The main feature of the engine is in the arrangement of the valves, by means of which the cylinders are used alternately for steam pressure, and for forcing air into the closed furnace of the boiler; and as the air is drawn round the tubes of a heater in the

can be constructed. Progress on the new engines was reported, and two of them are expected to be on the rails ready for work within 30 days.

Saint Catherine's Lighthouse.

Referring to the recent inauguration of Saint Catherine's Point Lighthouse, on the southernmost point of the Isle of Wight, the *London Engineer* gives an interesting description of the machinery and general equipment of this important station.

The electric light is employed, a power of 60,000 candles being obtained. Some idea of the power of this light will be conveyed to the reader when we say that the carbon pencils employed in the electric arc lamps commonly used for street lighting are about $\frac{3}{8}$ -inch thickness, while those which we are considering have a diameter of 60 mm., or nearly 2 $\frac{1}{2}$ inches. The lamp is of the modified Serrin-Berjot type, and the carbons, which are controlled by a duplex arrangement of spring and current, are not circular in section, but fluted, a valuable improvement introduced by Sir James Douglass, whereby the centrality of the arc is greatly promoted, the carbons are kept cooler, and a better supply of air to the lamp afforded. The 16-paneled dioptric apparatus is rotated, not by clockwork as usual, but by a small vertical engine worked by compressed air from below. As the time of rotation is of the utmost importance, a most ingenious regulator or governor is applied to the little engine which controls the speed by the automatic application of a brake should the motion become too rapid. Three compound engines furnish power, two of them being designed for driving the dynamos, while the third is used for compressing air for the fog-horn. Only one dynamo and engine are used for the light, the other set being held in reserve in case of accident. The two dynamos were built by De Meritens, of Paris, and the induction arrangement of each consists of 60 permanent magnets. We may add that the Saint Catherine light is at present the most powerful electric light in the world.

The Lubrication of Gas Engines.—

Gas engines are generally lubricated too abundantly, especially if it be necessary for the attendant to leave the engine for some time without supervision, in which case he prefers to arrange for an excessive supply of oil rather than run the risk of a break down, owing to insufficient lubrication. In consequence of this circumstance it becomes a matter of some importance to be able to use the oil which has once done service over again, and it is therefore of interest to note that a special apparatus has recently been brought out in Paris by M. E. Ducretet, of 75 Rue Claude Bernard, for filtering the oil as it comes from the cylinder. An engraving which is given of the device in one of our foreign exchanges shows the device placed around the exhaust-pipe of the engine, so that the heat of the escaping gases is utilized to raise the temperature of the oil under treatment, in this way greatly facilitating the process. The filter itself is contained within a vessel coated on the outside with some non-conducting covering, and consists of a cylindrical vessel having a loose cover, which can be screwed down by suitably arranged thumb-nuts, so as to compress more or less the filtering medium, which is generally composed of compressed cotton. Above the filtering medium is a series of perforated plates which retain the grosser impurities. The filtered oil can be drawn off at the bottom through a cup, and, we understand, has been found very satisfactory for further service. We are told that one of these filters has been in constant use in Paris for several months past with eminently satisfactory results.

At the recent annual meeting of the Strong Locomotive Company a contract was signed for the erection of extensive works, with special machinery for turning out one of their improved boilers per day, the works to be completed within six months from the date of contract. With these special tools the management claim they can turn out boilers as cheap per pound as the ordinary locomotive boiler

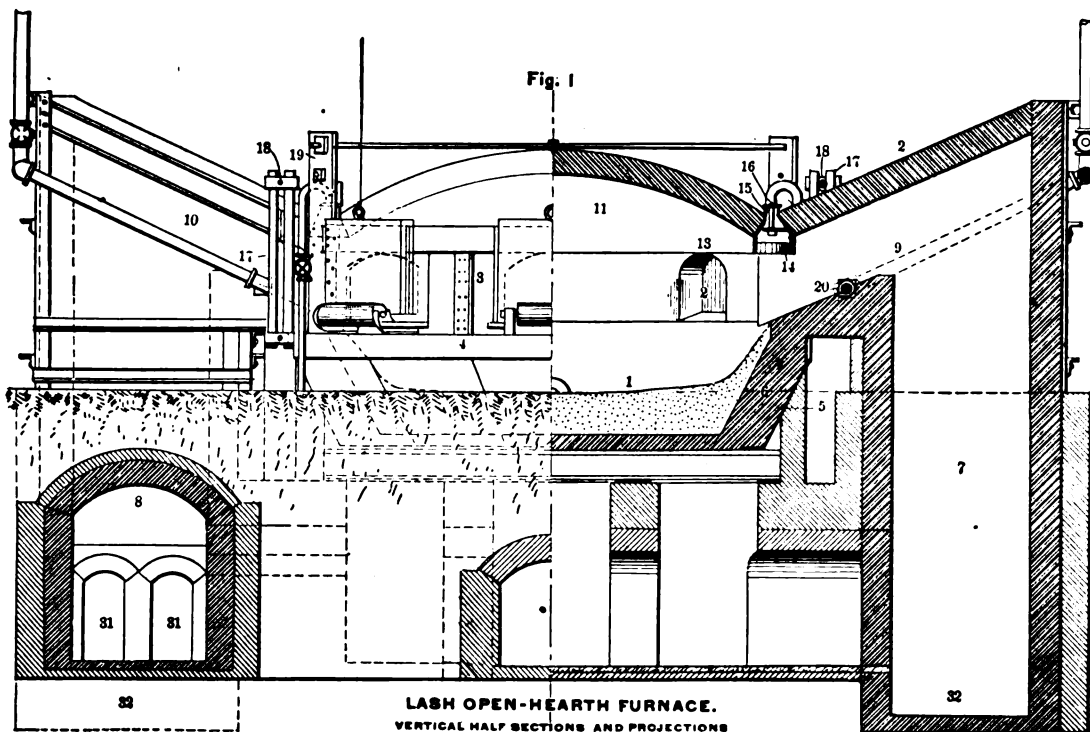

The Lash Open-Hearth Furnaces.*

BY ALFRED E. HUNT.

One of the chief defects of the original open-hearth furnace was that a large portion of the superincumbent weight of the

hearth in a plate-iron shell. This shell is carried on iron beams extending completely across the furnace and resting upon exterior walls or columns which are independent of the more highly heated and perishable parts of the furnace underneath.

the pipe are incased in the brickwork and open into the flats of each end of the furnace from the opposite side walls by leaving out the space of a header in the fire-brick at the ends of the pipe. This gaseous fuel is not diluted to fully 60 per cent. of its entire bulk with inert nitrogen, as is

furnace and its charge was supported by the brick walls, between the gas and air regenerators, which were at the upper part of the regenerators, softened by being subjected often to intense heat on both sides. This fault is obviated in nearly all of the newer designed furnaces by incasing the

Natural gas, in the favored regions, has been a great boon to the open-hearth steel manager; he no longer has to spend a very valuable portion of his time "poking the gas man to poke his fires." The gas is carried to the furnace in an even flow through a 3-inch gas-pipe, which branches off to both ends of the furnace in 2-inch pipes. The delivery and reversing of the gas is regulated by ordinary globe gas valves placed in the circuit. The ends of

Siemens gas, which has to be conducted in pipes of 4 feet diameter to one of the furnace gas regenerators to be preheated. Natural gas is conducted directly to the ports of the furnace, as it was found that preheating decomposed it and soon filled the checker work of the gas regenerators with deposited carbon. The use of cold gas is much more than compensated for in the heat produced by the combustion of the concentrated fuel and by avoid

PLAN OF OPEN-HEARTH, TWO-FURNACE PLANT.

SECTION ON Z-Z, FIG. 3.

LASH OPEN-HEARTH FURNACE.

SECTION ON V-V, FIG. 3.

LASH OPEN-HEARTH FURNACE.
WATER COOLED SUPPORT FOR ROOF

ing the large amount of nitrogen which is present in Siemens gas. Natural gas melting furnaces are now built so that both of the regenerators at each end of the furnace are connected with the air inlet valve, or they are built with only one regenerator at

each end of the furnace for preheating the air. In this case the air valve and air regenerators are built larger, with 60 per cent. greater capacity than when using Siemens gas. Natural gas is supplied in the service mains to melting furnaces in

the vicinity of Pittsburgh with a pressure of about 8 ounces, and this pressure is adjusted in the service-pipes by regulators ordinarily furnished to the plants by the natural gas companies, and which they place with their connection to their mains at some suitable point about the plant. The pressure, as regulated by the valves at the large sized Lash furnaces, is at present only about 1 ounce or $1\frac{1}{4}$ inches of water pressure as the gas goes into the melting furnace. The lighter the pressure, so long as the flow is kept uniform and steady, the better the combustion, and the more intense the heat. The steady uniform flow of natural gas has made it peculiarly applicable as a fuel for melting in open-hearth furnaces and has been a very potent cause of the growing reputation for regularity and uniformity, as well as for superiority in other ways, of the open-hearth steel made in the natural gas districts.

The tendency up to within the past year has been to increase the size and capacity of open-hearth steel furnaces, and the newer furnaces have been of 30 and 40 tons capacity instead of 5 and 7 tons as were those built at first. Except for special purposes, where large steel castings are to be made, the writer believes the limit of size has been reached. Experience with the large furnaces has led to the growing conviction at present that fur-

naces of about 15 to 20 tons at the maximum, are the most economical and produce the best steel.

The latest improved Lash open-hearth furnace plant the writer believes to be the best yet devised. It is peculiarly adapted to the use of natural gas, and there are, at the present writing, 12 furnaces now erected in Pittsburgh on the Lash system, four of 40 tons, five of 30 tons, one of 20 tons and two of 15 tons, and there are four 15-ton furnace buildings. See Figs. 1, 2, 3, 4, 5, 6 and 7, in which the parts are numbered for reference.

The hearth of the furnace (1) is made circular or, preferably, elliptical with major axis of 18 feet of hearth inside the linings and minor axis of 15 feet for a 15-ton furnace. This hearth is supported on beams resting on suitable walls or piers of such a height that the charging-doors are accessible from the ground level. The retaining shell of $\frac{1}{4}$ inch thick steel plates extends from the top of the side walls down to a broad connecting band (4) a short distance below the charging-doors; from this, the shell slopes inward to the bottom plates of the hearth. The lining of the hearth conforms to the shape of the shell, and since the bottom plates and supporting beams prevent any vertical movement downward, the conical shape of the outer walls of the lower portion of the melting chamber prevents almost all of the outward movement due to the expansion of the lining, thus preventing the rupture of the lower side-walls of the furnace.

The single flues (9) in natural gas furnaces at either end of the melting chamber are 5 feet wide and are simply large passages inclined down toward the bath at a pitch of about 4 inches to the foot, to give the flame a strong guide downward upon the metal. In order to provide a firm support for the arched roofs of the melting chamber and flues leading into it, a water-bosh, Fig. 7, made of $\frac{1}{4}$ -inch thick steel plate, is put in the form of a keystone in the arch of each roof, that of the melting chamber (15) and that over the downtake flues (2) butting against the plates of the inclined sides of the water-bosh, which in this way acts as a double skew-back or keystone. This bosh is 1 foot wide at the bottom and 5 feet long. It is stayed inside at proper intervals by transverse bars, and, although exposed on its under side to the intense heat of perhaps 3000° F. of the flue leading directly from the melting chamber, is found to work admirably; the writer has seen the under side of one of these water skew-backs after being in service for several months and having made over 100 heats in the furnace, which has stood perfectly, the scale being hardly detached from the surface of the metal. These water skew-backs are provided with 1-inch pipes (16) feeding water at 5 pounds pressure and leading out the waste water which is hardly lukewarm.

The side walls of the flues are held in place by suitable plates, angles and back-stays (16, 17, 19) and the outer walls of the furnace are also stayed from opposite sides by means of plates reaching upward from the surrounding bands of the melting chamber and diagonal rods (18). Natural gas is led into the sloping flues by wrought-iron pipes (10-17) which enter the brickwork near the "four corners" of the melting chamber. The gas being much lighter than the air, mixes with it in its downward rush into the furnace.

The stack (21) is placed in such a manner that the flues leading from each end of the hearth (22-23), which have checker-work in them, alternately act as regenerators to preheat the air before it enters the furnace. The lower end of the stack is connected by a short flue (24) with a four-way chamber (25), to which the flues (22-23) from each end of the furnace con-

verge and to which the air-duct (26) delivers. This air-duct (26) leads out from the ladle-pit (27) and passes directly under the hearth in this way, not only heating the air, but giving a free circulation under the hearth and preventing an excessive heating of the bottom. Along the middle of the flues (22-23) leading from the central four-way chamber (25) to the opposite ends of the furnace is placed checker-work of fire-brick supported on tiles (28), so that the bottoms of the flues are clear openings (29), giving a stronger draft; but as there is a constant tendency of the heated air to ascend there is a thoroughly uniform heating of the air entering the furnace by this arrangement.

The front portions of the flues are provided with a series of double arches, which not only serve to strengthen the side walls and tops of the flues, but also to increase the heating surfaces. The up-takes (7) are extended down below the points of entrance of the chimney flues, in this manner forming pockets (32) for the reception of any cinder, dust or other matter that may be drawn over from the furnace-chamber and preventing this material from going forward toward the stack and clogging the checker-work (31) in the chimney flues (22-23). Suitable openings are provided in the brick work, so that by taking down the brick bulk-heads these cinder-pockets may be easily opened and cleaned out.

The four-way chamber (25) has the air-duct (26) leading into it permanently open, and is fitted with a three-way valve (33) alternately connecting the flues (22-23) leading to each end of the furnace with the chimney (21) and with this air-chamber (25), in this way reversing the furnace on the well-known Siemens principle. This three-way valve (33) is hollow and is kept cold by a stream of water running through it, preventing the warping or burning out of the valve, or with Siemens gas furnace, the direct loss of fuel by leakage to the chimney.

The tap-hole of the melting furnace (34) is at about the ground level, and the metal is conducted through an inclined spout (35) some 10 feet in length to the ladle-pit (27). The ladle, after being filled, is lifted by a crane and transported to an auxiliary semicircular casting pit, only about 4 feet lower than the ground-level in which the ingot molds are set. The front of the furnace is provided with three cranes, so located that they cover the entire pit space, the ladle and ladle-pit and the furnace melting-chamber, so that if a movable roof be put on the furnaces, large pieces may be swung in on to the furnace hearth.

The great advantages of the Lash furnaces are:

1. They have all the ordinary and important operations around the furnace on one ground-level, the three doors on the back side of the furnace and the two on the front or tapping side being all accessible for charging or for repairs to the furnace. A record of 500 consecutive heats, of 50,000 pounds of stock each, shows that these were charged in an average of 24 minutes per charge, 12 men, or all hands about the furnace, doing the charging from all five doors which are balanced and arranged to open by levers in the pulpit under the control of the crane boy.

2. The ladle and the tap-hole are easily accessible from the ground-level, thus avoiding all swinging platforms and stages.

3. The gas and air-flues are so arranged as to be entirely isolated from the melting chamber and hearth except where the flues enter the furnace, thus doing away with the necessity of thick brick walls which are subjected to heat on both sides; the masonry being of uniform thickness

throughout much unequal expansion and bulging is prevented.

4. The chimney flues, regenerators, three-way valve and ladle-pit are all on one level, about 10 feet below the ground level, and easy of access for repairs.

5. The free access of air all around the flues and furnace-chamber prevents their being unduly heated at any time.

A Lash open-hearth plant is now being built by the Wetherell Bros. Steel Casting Company, at Thurlow, Pa., for the use of producer gas, with modifications necessary for the double sets of flues and checker-work to preheat the gaseous fuel as well as the air and double sets of ports, and the air over the gas for their entrance into the furnace. There seems to be no reason why the Lash system of furnaces, suitably modified, will not be equally advantageous for producer gas as for natural gas.

The rapidity with which repairs have been made upon Lash furnaces is one of the most important of their advantages. In two weeks' time, from heat to heat, a 30-ton furnace was repaired, the bottom taken out and the brick-work, from the ground level up, put in entirely new, with seven masons working on day turn, without any night work except in tearing out the brick-work, and in the five days making bottom and reheating.

Thirty-ton furnaces have been shut down and cooled off after the heat on Saturday, the furnace allowed to cool on Sunday, the roof and side walls torn out on Monday, the brick relaid on Tuesday and Tuesday night, gas turned on Wednesday morning, and the furnace charged, with good results, by Thursday noon. That is, a rebuilding of the lining of the entire melting chamber from the hearth up, and of the side walls of the flues leading to the down-takes, with a loss of time of only five days from heat to heat.

The Corinth Canal.—A letter from Corinth, Greece, gives a detailed account of the progress of the ship canal being constructed through the Isthmus at that point by a French company, who have received liberal concessions of land from the Government, accompanied with a proviso that there shall never be any claim for a subsidy in behalf of the constructors. The canal will measure 6300 m. from sea to sea, with a width of 40 m., and will be excavated to the depth of 8 m. below the sea level, mostly through solid rock, and the expenditure will be \$6,000,000. The depth of water will be the same as in the Suez Canal. Rapid progress is making in the work, which is prosecuted by 2800 men, and is expected to take three years for its completion. The appliances include 15 engines, each drawing from 60 to 70 trucks. At the western end of the canal, on the Gulf of Corinth, are situated all the large depots and offices of the canal company. Here a new town is growing up called Isthmia. The depth of water a short distance from the shore is 30 fathoms. The sides of the canal will be solid granite, and there will be no washing away or necessity of dredging. The largest docks will be at the eastern end. The tariff of the canal will be put down to a low figure, so as to catch all the coasting trade, and it is fully expected that, in spite of the great expense of the work, it will pay well in the end.

A new gas engine, known as the Sturgeon engine, has just been brought out in England by a Manchester firm, Messrs. H. Wallwork & Co. It is a beam engine of the compression type, and of that order which works by combustion under constant volume. An impulse is received at every revolution. Illustrations explaining the construction and the functions of the different parts were published in the *London Engineer* of June 15, 1888.

The Iowa Railroad Problem.

Iowa has set the example to the other States of attempting to correct by local legislation the effect upon local jobbers and manufacturers of the operations of the Interstate Commerce act. For this reason the experience which the people of the State are acquiring in the matter of regulating railroad charges is well worthy of wide consideration. Thus far their efforts have been attended with partial failure. Notwithstanding the heavy reductions made by the Railroad Commissioners of the State, shippers are already beginning to complain of the new tariff rates, on the ground that they give no relief to jobbers and manufacturers, in that the local rates prevent doing business against Interstate rates. For instance, on fifth-class freight the manufacturer, 50 miles from Illinois, ships in material at 7 cents per 100 pounds, and ships it out to a customer 50 miles distant at the same rate. That would be \$42 for the carload of 30,000 pounds. Now the Eastern manufacturer can ship the same freight to the same destination under Interstate rates for 8.4 cents per 100 pounds, or \$25.20 per car, a discrimination of \$16.80 per car—or, in other words, the Iowa manufacturer or jobber pays the railroad company \$16 per car more than the Eastern manufacturer for the same service, except perhaps the mere switching of the car to Iowa manufacturers' warehouse. If this discrepancy runs through the several classes, the jobbers and manufacturers of Iowa have not gained much by the maximum tariff law. Their next objective point will be the Interstate Commission and the Iowa Commissioners for an adjustment of rates. The Burlington, Cedar Rapids and Northern Road, which is an all Iowa road of the B-class, has decided to go to Illinois for its coal. It has heretofore received its supply from What Cheer mines, but under the new tariff law it can go to Illinois, a much greater distance, and get it at less cost.

Mr. Ives, of the Burlington and Cedar Rapids road, has put the following conundrum to the Railroad Commission: Can a B-class road make a tariff beginning 15 cents higher (as entitled under the rule) than for an A-class road and run down to A-Class road figures after the first 100 miles? How shall figures be adjusted in making joint tariffs between roads of different classes? Can the short rates for different classes be aggregated, or shall the joint tariff represent a long haul by adding the distances and making rates accordingly? The Commissioners will be kept busy with problems of like nature for a time. So unsatisfactory to the railroad companies are the rates made by the Commissioners that they are appealing to the courts for their interference. On the 28th ult. the Commissioners were served with a temporary injunction by Judge Brewer, of the United States Circuit Court, at St. Paul, enjoining them from putting into force the new schedule of freight rates on Iowa roads. The notice requires them to appear before him at Leavenworth, Kan., July 5 and show cause why they should not be permanently enjoined from issuing such a schedule. The petitioners in this case were the Chicago and Northwestern road, the Chicago, Burlington and Quincy road and the Chicago, Milwaukee and St. Paul road. Judge Brewer gave them a hearing at St. Paul, Justice Miller, of the United States Supreme Court, also being present. The counsel for the roads say that the new schedule would ruin their business; that they have got to fight in the courts and the sooner they begin the better it will be for all concerned.

On the 29th ult. the Railroad Commissioners were served with an injunction,

issued by Judge S. H. Fairall, of the District Court of Johnson County, Iowa, restraining them from promulgating the new schedule of rates. This is additional to the injunction issued by Judge Brewer of the United States Circuit Court, but is based on substantially the same ground. The petitioners in this case are the Chicago, Rock Island and Pacific Road and the Burlington, Cedar Rapids and Northern Road. Both of these companies are incorporated under the laws of Iowa, hence they seek relief through the State Courts. The principal reason given in the application for an injunction is that the proposed schedule is not a "reasonable" rate, as required by law, but is so unreasonable and severe as to cause the roads to do business at a loss if it is put in force. Comparisons of rates with those in other States are set out, showing that the Iowa rate is lower than all. It is understood that all the Iowa roads, including the trunk lines crossing the State, have agreed to pool their issues, and make a common test of the case in the courts.

NEW PUBLICATIONS.

A MANUAL OF STEAM BOILERS: THEIR DESIGN, CONSTRUCTION AND OPERATION. By R. H. Thurston. Size 6 x 9½ inches; 671 pages. Published by John Wiley & Sons. Price, \$6.

In preparing the above work, Professor Thurston followed the double purpose of supplying a book which would, in a measure, meet the wants of the designer, builder, and the manager of steam boilers, and at the same time admit of being advantageously used as a text-book in engineering schools. On the whole, he has been eminently successful; in fact, there is, we believe, at present, no other work which is so well, if indeed at all, adapted to these ends, and student and engineer alike will find it a valuable guide and counsel. The opening chapter gives a very interesting historical account of the steam boiler, and is followed by considerations of the materials employed in its construction, their physical and chemical characteristics, methods of testing calculations of strength of different forms of boilers and allied subjects, fuels and their combustion are then taken up, and are followed very appropriately by a chapter on heat, its production, measurement and transfer. Obviously a good deal of old ground is gone over in dispensing of these subjects; still this is essential to the thorough treatment which Professor Thurston follows, and the reader will scarcely find reason to complain of the space thus taken up. What may be considered the subject matter proper, is reached in Chapter VII, entitled "The Design of the Steam Boiler." The various items involved are here taken up one after the other, and examples from practice are introduced to illustrate the proportions of different parts of boilers of several types. The design of the plain cylindrical boiler is the simplest problem of its class, and is, therefore, considered first. Then come stationary and marine single and multifue and tubular boilers, sectional and water-tube, upright and portable, and finally locomotive boilers. The specifications which are given are necessarily brief, but cover the principal points and afford an idea of what is to be taken into account in the work. The accessories, such as the setting and chimneys, are treated of in another chapter. Following this is the construction of steam boilers. Under this head the author describes the methods and processes employed, the tools and machinery necessary and the work of construction proper. Specifications and contracts make up an interesting and instructive chapter. Sample specifications are given for a horizontal tubular boiler, a flue boiler and one of the sectional type,

and two dimension specifications are added of boilers and locomotives as issued by the Pennsylvania Railway motive power department. For the benefit of boiler attendants Professor Thurston has here incorporated, also, some good advice on the care and management of boilers. Under the head of "Steam Boiler Trials," the instructions and rules governing the standard system, prepared several years ago by a committee of the American Society of Mechanical Engineers, are reprinted.

The concluding chapter is devoted to steam boiler explosions, and with some modifications was published as a separate volume last year, a review of it having appeared in our columns at the time. An appendix, containing tables relating to steam and water, is also added. The plan of the work is well arranged, and, in the main, admirably executed, and we are confident that the book will be warmly welcomed by the engineering profession.

USES OF BELTING. By John H. Cooper. Illustrated. Size, 6 x 9½ inches. 390 pages. Published by Edward Meeks. Price, \$3.50.

As Mr. Cooper's book has reached its third edition we need not consider it as an entire stranger, its general character being no doubt familiar to a large number of readers. The principal feature of the new issue consists in the addition of several foreign articles on belting, and extensive reference to contributions which have been made to engineering societies, the collection of practical data from different sources also having been enlarged. It may be well to briefly repeat here that the book is virtually a compilation of facts and figures, a circumstance which is apparent at a glance, the author himself having in the main performed simply the work of editing the several parts and properly classifying them. Mr. Cooper, in fact, explains that his work, arising originally from a desire to know about belting for shop use, has been that of collecting, condensing and comparing existing published data and rules. To these have been added examples of belts in use, with the object of showing how closely their performance corresponds to the rules which are given for such cases. The reader must, however, be prepared to find considerable divergencies in the results which are given by following several formula supposed to yield practically identical figures. Those who have endeavored to secure a convenient formula for belt powers and widths under known conditions by consulting different authorities have, we believe, invariably encountered these amazing discrepancies, and Mr. Cooper's book, for obvious reasons, can prove no exception. But the information which it contains is nevertheless of much value, presenting, at least, data derived from cases in practice.

English Cruisers.—Several of our English contemporaries are complaining that some of the recently designed fast cruisers for the British Navy are not at all what the name implies, having been designed for a speed of not more than 16½ knots, under forced draft. The proposed vessels, six in number, will be built of steel, and will be 230 feet long and 35 feet wide. Each will have a displacement of 1580 tons and be fitted with triple-expansion engines, estimated to develop 8000 horse-power, also under forced draft. The armament is to consist of quick-firing and machine guns, together with torpedo tubes. It is not stated whether the speed will be that developed during the official trials, or that which can be counted on in regular every-day work, but, in any event, it is interesting to note that the latest developments in the designs for the English navy will not be remarkable for the high speeds with which they are ordinarily credited.

Segment Re-sawing Machine.

We illustrate on this page a new circular re-saw with segment blades, for use where a great deal of work is wanted with the least waste in kerf. The saw is manufactured by the Egan Company, Cincinnati. It can be used to great advantage for all kinds of splitting in car works, box factories, planings mills, furniture and piano factories who desire to hold their lumber well up to size. The segment blade takes out but little kerf, is easily kept in order, and both the quantity and quality of work are all that can be desired. The frame is very heavy and substantial, and is placed

best crucible steel of large diameter, running in self-oiling boxes; the pulley on mandrel is placed between bearings, which are adjustable, and slide on planed ways to and from the feed rolls to accommodate any size saw, and to bring the teeth of the saw close up to the feed rolls.

The New English Magazine Arm.

The following particulars connected with the proposed new magazine gun for the British army will doubtless be interesting to many. The bore is 0.303 inches diameter giving about 33 per cent. more

magazine. One magazine is attached by a chain to the rifle, so as to secure its retention. Subsequent magazines may be discharged and thrown away, if necessary, in the full heat of action, for in the continued use of magazines we are contemplating a time of supreme stress and importance. The attached magazine contains eight rounds, those subsequently used six rounds each. At present the infantry soldier will carry one or two spare magazines; thus, with the first one, he is furnished with a reserve of 14 or 20 rounds for rapid discharge, according to whether he has one or two spare magazines. Cavalry and mounted infantry could carry bandoliers

NEW SEGMENT RE-SAWING MACHINE, BUILT BY THE EGAN COMPANY, CINCINNATI.

perfectly true to receive the swinging feed roll frame and mandrel boxes. The feed consists of four heavily geared feeding rolls, with front top rolls for straightening wide boards. The frame which carries the feeding rolls is pivoted on the main frame in such a manner that all four rolls can be adjusted to any angle at once by loosening one hand-lock nut; the setting and angling is done by an adjusting screw to facilitate accuracy in adjusting the rolls to any desired angle. The rolls are self-centering—that is, a board 1 inch thick may be followed by one $1\frac{1}{4}$ inches thick, and both may be split in the center, or either pair of rolls on either side of the saw may be made rigid by loosening one hand nut, so that slabs of any desired thickness may be cut from a plank. The rolls come within $\frac{1}{8}$ inch of the bed plate, allowing strips $\frac{1}{8}$ inch thick to be split if necessary, which is an advantage not possessed by many other machines. The mandrel is of the

same weight of ammunition. It has a detachable magazine. Experiments with the Martini-Henry, with a rifle with a fixed magazine, and also one with a detachable magazine, have shown that the last has a great advantage, arising from the circumstance that when a magazine is empty another filled magazine can be put in its place in the same time that it takes to get a cartridge out of the pouch and load with it. Thus the soldier is able to keep his attention directed almost wholly at the object at which he is firing, so long as his supply of magazines lasts. In a fixed magazine the advantage of rapidity is confined to the number of rounds supplied by the single magazine. When they are discharged the rifle is simply a breech-loader until a suitable opportunity arises for recharging the magazine, unless some special charging gear is applied which approaches in degree the conditions of a detachable

with eight or ten detachable magazines. Three hundred and fifty rifles are ready for the troops.

The extensive improvements which have been in progress for nearly a year in South Brooklyn, better known as Gowanus Bay, will soon convert that section into a valuable warehouse and dock property, with railway and other terminal facilities. The New York and South Brooklyn Ferry Company and the South Brooklyn Railroad and Terminal Company are virtually a single organization, all the parties concerned being united in a common interest, and by whom the extensive water front between Twenty-eighth and Thirty-ninth streets is being improved, on the line of Second avenue. The west side of this avenue will be occupied by warehouses. The expenditure in the development of this enterprise is \$3,000,000 during this year alone.

THE WEEK.

Nearly all the grain storage capacity in Brooklyn has come into control of a new organization called the Brooklyn Warehouse Company, Edward Annan being president. More exactly stated, the number of stores in the combination is 134, and the aggregate capacity is 20,000,000 bushels. This result is attributed to the new elevator law, which, it is alleged, compels warehousemen to combine for common defense.

The spread of population into the annexed district above the Harlem continues with little abatement. Four lines of railway traverse the district, affording quick communication with the business portion of the city, and a line of the Suburban Rapid Transit Elevated Railroad is being pushed beyond One Hundred and Sixty-sixth street. The Manhattan Elevated Railway Company is building a grand terminal station for its east side lines near that point, between Second and Third avenues. The main line of development is along the Harlem River and the new railways, but there are broad and attractive districts between them and over eastward toward Long Island Sound about Hunt's Point, on the line of the New York, New Haven and Hartford Road and along the line of the old Boston post road, which has been widened and graded from One Hundred and Sixty-fifth street to Bronx Park. Altogether the district is capable of supporting a population of several millions, and it is growing at a promising rate.

Is the milling center moving back to the East? This question is discussed affirmatively by a writer who assumes to speak from a knowledge of the facts, representing that Minneapolis has already reached its zenith; that the building of big mills west of Chicago has ended and that Buffalo and other Eastern points have the advantage of location. He says: "The milling center has been forced too far West, and, beyond its natural and hence permanent limits by artificial means—chief of which have been lower through rates of freight the further West the miller has gone, and, next 'milling in transit,' by which the Northwest has had an advantage over the rest of the country, both in selling its flour and in buying its wheat. Hence the rapid growth of Minneapolis as the milling center of the country and of the Northwest, aided by its superior water power. But that point has now outgrown the advantages by which its supremacy was secured."

Santiago de Cuba has been placed in telegraphic communication with ports in Hayti and Venezuela.

Owing to rivalries between express and railroad companies, freight charges on merchandise shipped from Eastern points to Chicago have been cut recklessly. In some instances through-bound Western freights have been carried by express as low as 90 cents per 100 pounds to Chicago and other Western points, and many contracts, some for two and three years and even a longer period, are said to have been made for prices ranging from \$1 to \$1.50, and they are still in existence. Efforts are now making to come to an agreement.

The new timber raft or "ship," as the contractor insists upon calling it, will sail from Nova Scotia for New York some time during the present month. It is like a huge cigar in shape, is 800 feet long, 53 feet in breadth at the widest part, 38 feet high in the center, and draws 22 feet of water. It will contain when completed 22,000 logs, averaging 38 feet in length, 11½ inches in diameter at the butt, running to 6 inches at the top end. The

whole big mass is to be bound together by 33 tons of chain, a large quantity of steel wire also being utilized. The raft is valued at \$33,000.

The customs receipts at the port of Montreal for the fiscal year ending June 30 were \$7,720,998, as compared with \$8,874,147 the previous year, showing a decrease for this year of \$1,153,149.

Three laborers were imprisoned all day in a caisson sunk 80 feet deep in the river near Council Bluffs, where a bridge to Omaha is building, and one of them was completely paralyzed. One of the doors of the air locks, through which the men pass, had become clogged with concrete, and when they attempted to return the door could not be opened. An extra door had to be built to cover the shaft before they could be released.

The Philadelphia Manual Training School held its first annual commencement exercises last week, and about 60 pupils received their diplomas. Prof. Wm. L. Sayre, the principal, presided. Superintendent MacAlister in an address, said: "What the Manual Training School means for every boy is an education broader, more comprehensive, more humane, more elevating than any heretofore offered in the history of the world. For years the world has been moving in this direction, for making education more human, more in the direction of training, and fitting boys to enter well prepared into the battle of life. It is a school which seeks to strengthen the intellectual culture of its pupils. The boy, in place of feeling with mere abstraction, with mere words, comes into contact with things, with this great, real universe in which we all live, and, therefore, his intellectual thought is most profound, his thought is more real to him."

A gigantic scheme has been proposed, by which the canons of the Rocky Mountains are to be dammed up from the Canadian boundary to Mexico, in order to form vast reservoirs of water to be used in the irrigation of arid lands, and so prevent floods in the lower Mississippi. Major Powell, director of the National Survey, estimates that at least 150,000 square miles of land might thus be reclaimed—a territory exceeding in extent one-half of the land now cultivated in the United States. The plan is to build dams across all the canons in the mountains large enough and strong enough to hold back the floods from heavy rains and melting snows, and then let the water down as it may be needed upon the land to be reclaimed.

There being some prospect of a profitable trade in the exportation of live cattle from the Hawaiian Islands, the United States revenue officers decide that cattle may be admitted for immediate slaughter without undergoing quarantine.

Three million feet of gas is the lowest estimate of the flow of natural gas every 24 hours from the well just finished at Sparta, Ill. The escape is attended by a roar that can be heard at Marissa, 10 miles away, and in the immediate vicinity the force exerted gives the earth a vibration similar to that noticeable in a factory building when the machinery is in motion. How to derive practical benefit from the well has not yet been decided.

Edison is having talks in England through his perfected phonograph "in his own familiar and unmistakable tones," although more than 3000 miles away from his auditors. He proposes to mail phonograms daily, deriving an advantage therefrom as compared with a style of writing not always legible.

The corner stone of the new United States Trust Company's building, which promises to be one of the finest of the

down-town business edifices, was laid in the massive foundations at 43 and 45 Wall street, under the auspices of the building committee of the company. A large leaden box, containing coins and newspapers of current date, was plastered in the stone with appropriate ceremonies. The building is to be nine stories high, and will have a frontage on Wall street of over 50 feet. It will be of the Romanesque style of architecture, and will be principally built of a heavy rock-faced pink Massachusetts granite and Long-meadow brown-stone. The banking room of the company, on the ground floor, will be 21 feet high and trimmed throughout with marble. It will be furnished with all the modern conveniences, and a new system of ventilation invented by R. W. Gibson, the architect of the building. The estimated cost of ground and building is \$1,700,000. D. H. King, Jr., is the builder. It will be ready for occupancy on May 1, 1889.

A case of alleged conspiracy on the part of employers grew out of the shoemakers' strike in Weymouth, Mass., and Judge Pratt, of the District Court in Quincy, has announced his decision. The complainant was Thos. Williams, a workman who left the shoe factory of John Carroll, on strike, after his demands for higher wages had been refused. He then entered the employment of another firm, but being discharged on account of the previous difficulty Williams sued Carroll, claiming damages for conspiracy to prevent his earning a living. It was admitted by defendant's counsel that the plaintiff was discharged in pursuance and in consequence of an agreement among the manufacturers. Judge Pratt said, in reviewing the testimony: "It seems to be the policy of our laws, and one in full consistency with the enlarged spirit and freedom of the present day, that every man has a right to determine what branch of business he will pursue, and to make his own contracts with whom he pleases, and on the best terms he can. He may refuse to deal with any man or class of men, and it is no crime for any number of persons, without an unlawful object in view, to associate themselves together and agree that they will not work for or deal with certain men, or classes of men, or work under a certain price, or without certain conditions. It seems to be well settled law that any workman, or body of workmen, may lawfully form and act as an association for the purpose of protecting themselves against the 'encroachments' of their employers. Applying the same course of reasoning to the present case, it would seem more than absurd to deny to employers at least the same rights of combination to protect themselves in a situation which combined labor has forced upon them. In the case on trial I find no evidence which shows, or even tends to show, any criminal, unlawful or improper combination on the part of the defendant with any man, or body of men, within the definition of the quoted authorities, and, therefore, order judgment for defendant."

A contract has been awarded to the Philadelphia Gas Improvement Company for supplying an amount of gas not exceeding 3,000,000 cubic feet per day, at 87 cents per 1000 feet. The company submitted four processes, and that known as the Hanlon & Leadley was selected. The company are required to erect without delay a plant that will cost \$275,000.

A source of wealth which Baltimore has very greatly expanded since 1880 is her manufacturing industry. In 1870 the whole State of Maryland had but 2759 manufacturing establishments, with \$26,049,040 of capital, 33,182 hands, and products worth \$59,219,933 in the inflated currency of that time. In 1880 Baltimore alone had 3683 establishments, with

\$38,586,773 of capital, 56,338 hands, and products worth \$78,517,304. Since 1880, however, Baltimore's industrial activity may be said to have taken fresh start. If there has been a loss to the city in certain branches of trade, as in coffee, sugar, cotton and tobacco, the loss has been more than made good by the gain in manufactures.

Claus Spreckels's sugar refinery now in course of construction in Philadelphia, will require 21,000,000 gallons of water a day for its refining processes, or about one-third of the daily consumption of the entire city. The filter house will measure 325 x 68 feet, and be eight stories in height.

A gas-holder of 4,000,000 gallons capacity, the largest ever made in this country, is being built by the Continental Iron Works for the Consolidated Gas Company. Its diameter is about 190 feet, and the tank beneath is 200 feet in diameter and 40 feet high. The guides are about 80 feet high. Altogether 2500 tons of iron are consumed in the construction.

The Underground Railway Company has in prospect a protracted legal contest before it can obtain right of way in the streets. The Commissioner of Public Works insists that the company has never been duly organized, is not acting in good faith, and has not complied with the terms of its charter.

The Attorney-General of this State heard arguments on May 14 in support of petitions in which he was urged to bring suit against the Sugar Refineries Company, commonly called the Sugar Trust, and against one of the corporations absorbed by that organization. He has now decided that it is important to ascertain by judicial investigation whether the allegations set forth in the petition are true. It is stated that application will at once be made to the Supreme Court for leave to bring an action in the name of the people against the North River Sugar Refining Company. The permission of the court is not required in the case of the Trust, and for that reason it is possible for the Attorney-General to proceed against the Trust without much delay.

The arrivals of vessels at this port during June, both foreign and coastwise, were smaller than during the month of June in several previous years. British foreign arrivals number 215 out of a total of 513 and as compared with 162 American. Of the aggregate 200 were steamships.

A steel freight boat was launched last week at the head of Lake Superior, for Captain McDougall, to be employed in the grain and coal trade. The captain's scheme is the very practical one of reducing insurance rates on vessel cargoes, as well as reducing the actual cost of transportation of wheat and coal on the great lakes and canals. The vessel is 187 feet in length over all, 25 feet in width and 18 feet in depth. She is flat-bottomed, tapering from the water to stem and stern. She has no machinery whatever, being simply a big steel boat. Her deck consists of nine steel hatches, guarded by a wire-rope fence.

The increase in the assessment of city real estate this year in San Francisco is \$16,000,000 over that of last year, while the increase of personal property assessments is \$2,500,000.

President Flores, of Ecuador, who is now visiting New York City, speaks extravagantly of the benefits to be derived by his country from the completion of the Panama Canal, which he is confident will take place not later than two years hence.

It is now fully a year since the Legislature of the State of Minnesota passed its law for the regulation of railways.

This law is similar in character to the Interstate Commerce law, differing therefrom only in that it provides for a Board of Commissioners who have the power to fix rates, and to take measures to compel the railroads to accept them. The Minnesota Commissioners hold that the courts have no jurisdiction over them, and that their rates must be enforced by the roads whether the latter consider them reasonable or unreasonable. This is substantially the position now occupied by the Iowa Commission.

Denver is about to have an astronomical observatory that will rival the famous Lick observatory in California. Its dome will rise from a plain and have 1000 feet greater elevation. The building and instrument have been provided for through the liberality of W. B. Chamberlain, of Denver. The framework of the metal dome is of iron and steel, and is made as light as is consistent with a high degree of rigidity. The covering is of galvanized iron. The weight of the dome will be about 12 tons, and the devices for making it revolve easily are very ingenious; the endeavor is to substitute rolling for sliding friction. For this purpose a live-ring is employed. This consists of a number of wheels set at equal distances around a circular track; on the circumference of these the dome rolls. The telescope, which is now being completed, will be a very valuable and expensive instrument. The diameter of the object-glass will be 20 inches and the length of the tube about 26 feet, of the best hard-rolled steel.

The formidable naval graving or dry dock, in course of construction at Esquimalt, on the Pacific Coast, under the direction of the British Government, is described by a correspondent lately visiting in British Columbia. This huge dock, now almost finished, is 450 feet long on the coping level and 430 feet long on the floor. It is 90 feet wide on top and 41 feet wide at the bottom. It is excellently constructed of hard sandstone, quarried near by, with a trauling caisson of wrought iron. Fortunately for any enemies of Great Britain on the Pacific Coast of North and South America, the dock has been finished on the basis of naval requirements of 20 years ago, and is not now large enough for the first-class vessels in the English navy. Still more fortunately for this country, it is not so large or so good a dock as the one under way in California. The contract for this Canadian dock was awarded in November, 1864, and work was begun early in the following year. It cost about \$900,000, which is defrayed by the joint contributions of Great Britain and the Dominion.

One of the New York morning dailies has taken pains to collect the statistics of defalcations in the United States for a series of years, and beginning with 1878 finds that there were 34 instances of official dishonesty during that year, and that the amount of money involved was \$2,784,806. Few of the offenders "met any punishment, being able in many instances to condone their offense by negotiation and the surrender of a part of their plunder." Our contemporary proposes to show the rapid growth and alarming extent of heavy defalcations by trusted individuals during the past ten years.

A correspondent at Port au Prince shows how narrowly Hayti escaped another revolution last May. Happily after a few days of martial law the leading officials in rebellion were exiled and quietness was restored. The writer says: "The principle that 'to the victors belong the spoils' reigns supreme, and is the sole issue in Haytian politics. The effect has been most disastrous. No material and consequently no moral and intellectual ad-

vance has been possible, and there is reason to believe that there has been actual retrogression until quite recent times. The magnificent sugar and coffee plantations of the French, with their systems of irrigation, have been allowed to go to ruin, and are now indistinguishable from the surrounding forests. The island is almost in a state of nature, except in the immediate neighborhood of the seaports. The exports are the spontaneous production of an amazingly fertile soil, principally dye and cabinet woods and the coffee pickings of the old plantations. All exports and imports are taxed to the extreme limit—just short of prohibition. Still, not a single article is manufactured by the Haytians. Haytian laws forbid a white man holding a title to land; nevertheless, the bulk of the mercantile business is carried on by German, French and American companies. The wealthy Haytians derive their revenues from ground rents in the cities and the spoils of office, consequently they have comparatively little to lose by revolution, which is their occupation and amusement. By the black savages of the interior a revolution is always welcomed with fierce joy. It is their opportunity to loot and burn the stores of the hated whites."

Real estate movements in New York city this spring are sluggish. Neither dealers nor builders take hold with avidity. Nevertheless, applications for new buildings are numerous in Brooklyn and New York. It is noticed that while there is much less activity in the building industries compared with one year ago, the scale of expenditure averages higher.

The Melbourne Exposition, to open August 1, will commemorate the founding of European settlements at the antipodes. The building is a grand structure 1240 feet long and 1000 feet wide, comprising, with its temporary annexes, more than 1,000,000 square feet. The area according to divisions is as follows: Space available for outside exhibits, 8½ acres; area of main buildings, machinery and temporary annexes, 23½ acres; total area of gardens, 12 acres; Carlton gardens, 19½ acres. Total, 63 acres.

The nucleus of the great Southern empire now has a population of close on 3,750,000. The latest statistics on the subject give the following:

New South Wales.....	1,044,000
Victoria.....	1,035,943
Queensland.....	359,059
South Australia.....	315,000
Tasmania.....	140,711
Western Australia.....	44,532
Total.....	2,939,245
New Zealand.....	645,615

Grand total.....3,584,860
The principal centers of population are Melbourne and its suburbs, estimated at 400,000, Sydney, 370,000, Adelaide, 135,000, Brisbane, 55,000, Hobart, 30,000, Perth, 6000 and Wellington, New Zealand, 28,000. In addition there is Auckland and New Zealand with a population of say 50,000, and Dunedin with a somewhat smaller population.

The public benefactions of the Vanderbilt family are held up as an example to the rich people in other cities. The Club-House for railroad men, the Hospital and Nurses' Training School for women and the Mission Church, all the gift of Cornelius Vanderbilt; the Hospital for Cancer Patients, erected and endowed by Wm. K. Vanderbilt and his married sisters, and the Free Circulating Library in Greenwich avenue, built and to be supplied with books at a cost of \$100,000 by George Vanderbilt, are instanced as proving that the present heads of the family are "really determined to be something more than mere millionaires."

MANUFACTURING.

Iron and Steel.

W. H. Peters, C. E. Murdock, George Peters, Jas. F. Peters and John Peters, Sr., are the incorporators of the Jackson Furnace Company, formed to operate the Huron Furnace property, at Jackson, Ohio, which they have purchased. The capital stock is \$25,000. The purchase includes 235 acres of coal land, and there is a shaft mine at the furnace from which coal will be obtained without the labor of transporting it. Ore and limestone from the Lawrence Furnace lands will be used. Huron is a 25-ton hot-blast furnace, size 50 x 13 feet, which was remodeled seven or eight years ago and has been idle for some time past. The new company propose to have the furnace in blast by the 1st of August. John Peters, Sr., was made president of the company, J. F. Peters, vice-president and W. H. Peters, secretary and treasurer. The last-named gentleman will have charge of the property.

Mr. H. W. Rathbone, president of the Elmira Iron and Steel Rolling Mill Company, Elmira, N. Y., informs us, under date of June 30, that the report of a stoppage at the works, printed in our last issue, is incorrect. The mills and furnace are in full operation.

The Struthers Furnace Company of Struthers, Ohio, have secured another lease of the Struthers furnace at that place from Mr. Fayette Brown, receiver, and will probably put it in operation as soon as repairs now being made are completed, which will be some time about August 1 next.

In answer to a report that the Pine Iron Works of Joseph L. Bailey & Son, located at Pine Iron Works P. O., Pa., would close down for an indefinite period, we received the following from the firm under date of the 25th ult. "We are running about half time, but have no intention of closing down at present. Trade here is very dull, the 'tariff agitation' in Congress rendering it uncertain and consequently dull."

Mount Laurel Furnace, owned and operated by the Clymer Iron Company, of Temple, Berker County, Pa., will be blown out about the 5th inst. for repairs, which will be made during the latter part of the year. The furnace will hardly resume operations again this year.

Isabella Furnace, of Jos. D. Potts, located at Barneston P. O., Chester County, Pa., was blown out on May 27 last for repairs, which are now being pushed to completion as rapidly as possible.

The Virginia Nail and Iron Works Company, of Lynchburg, Va., under date of the 28th ult., write us as follows: "We blew in our new furnace (the Nannie B) on the 12th inst. She has been running along very nicely, making an excellent quality of pig iron from James River ores. We, of course, use coke. Dimensions are 65 feet high, 12 foot 3 inch bosh, 6 foot 6 inch hearth, with 7 foot 6 inch top; commenced work in May, 1887, on foundations, &c. We use water-power. The furnace is fitted up with two iron-pipe stoves. The gas not required for the stoves is taken to the heating and puddling furnaces of our rolling mill."

In our issue of last week we made mention of the fact that the blast furnace of the Penn Iron and Coal Company, at Canal Dover, Ala., had blown out for repairs. We have since received the following advices from the company, under date of the 27th ult.: "We blew out after a continuous campaign of 28

months. Will put in new lining and bosh complete and make considerable addition to blowing capacity. We are located in the middle of the Blackband ore district of the Tuscarawas Valley, and make a specialty of blackband foundry iron, using a larger percentage of blackband ore in our Tuscarawas pig iron than is used in any blackband brand made in the United States. We will blow in again about August 15 next.

The entire plant of the Sharon Iron Company, at Sharon, Pa., closed down on Saturday, the 30th ult., for repairs and stock taking, and will probably not resume until a settlement of the wage scale trouble takes place.

In our issue of last week we made mention of the failure of the Cartwright Iron Works, of Alikaima, Ohio. A press dispatch from Steubenville, Ohio, gives the following additional particulars of the failure: The statement of liabilities of the Cartwright Iron Works, which assigned on Wednesday evening, confirms the original estimate. They will reach \$60,000. The assignee refuses to make public the names of the creditors and the amounts due them, but representatives of several Pittsburgh iron and machine firms were in the city to-day investigating affairs. It is said that the company held a large block of Graff, Bennett & Co.'s paper, upon which they could not realize. This, with the inadequate size of the plant, precipitated the failure. The company have only about \$7000 personal property above the value of the plant, upon which there is a mortgage of \$9000 held by the Miners' and Mechanics' Bank, of this city. This bank sold the company the plant for \$12,000 originally. The assignee has issued time certificates to the employees for their wages, which they have negotiated for 50 cents on the dollar. It is now feared that the personal property will not be sold for much more than to pay the employees, to whom there is owed \$3500, and the costs of assignment.

On Thursday, the 28th ult., the employees of the Linden Steel Company, Limited, of Pittsburgh, were notified that their wages would be reduced 10 per cent., to take effect on July 1. The reduction applies to all men who are not members of the Amalgamated Association. It is expected that the men will refuse to accept the proposed reduction. A meeting of the employees will be held during the present week to take action on the matter.

The entire plant of Singer, Nimick & Co., Limited, steel manufacturers, at Pittsburgh, has been closed down for an indefinite period. Some time ago the firm posted a notice of a reduction of 10 per cent. in wages, to take effect on June 1 last. This was accepted by the workmen and the works continued in operation until the next meeting of the Amalgamated Association and the Knights of Labor, which were held at Pittsburgh. The firm employs men who belong to both of the organizations, and, having a reduction of wages without the authority of the associations to which they belonged, they were threatened with expulsion if the reduction was not at once restored. The firm refused to grant this and on Wednesday, the 27th ult., the following notices were posted on various parts of the works:

Notice.—Wednesday, June 27, will be pay day instead of Saturday, June 30.

SINGER, NIMICK & Co., }
PITTSBURGH, June 27, 1888. }

This is to give notice of the discharge of all our hands. Any person desiring to enter our employ hereafter may make application to Mr. F. B. Nimick, either personally or by mail.

W. H. SINGER, Chairman.

It is evidently the intention of the firm to deal with its employees individually hereafter, so as to prevent another interference from what are considered outside

parties. It is expected that a majority of the employees will withdraw from labor organizations to which they belong and that the works will resume operations in a short time.

Mr. Albert Broden, of Reading, Pa., has been appointed superintendent of the furnaces of the Philadelphia and Reading Coal and Iron Company. He will have charge of some ten furnaces along the main line of the Reading Railroad and branches.

A large brick addition is being made to the galvanizing department of the National Tube Works Company, of McKeesport, Pa. The entire plant of this company was closed down on Saturday, the 30th ult., for the purpose of making repairs. As soon as these are completed part of the works, at least, will resume operations. The report published that the shut-down was for an indefinite period is untrue.

At a meeting of the directors of the Bethlehem Iron Company, held at Bethlehem, Pa., on Tuesday, the 26th ult., a local paper states that the report of the president showed a very material falling off in the output and profit. The profits during the past year were hardly sufficient to pay the interest on the funded debt and the dividends to stockholders. The following were elected directors: E. P. Wilbur, Robert H. Sayre, Sr., Robert P. Linderman, W. W. Thurston, Joseph Wharton, John Knecht and George H. Myers. W. W. Thurston was then elected president, R. P. Linderman, vice-president; Robert H. Sayre, Sr., general manager; John Fritz, general superintendent; C. O. Brunner, treasurer, and A. S. Schopp, secretary.

The Robinson-Rea Manufacturing Company, of Pittsburgh, manufacturers of rolls and rolling-mill machinery, report that they are crowded with orders for rolls and are running their works to their utmost capacity in order to keep up with the demand.

Robesonia Furnace, at Robesonia, Pa., has again gone into blast.

A new engine has recently been placed in the works of the New Castle Wire Nail Company, at New Castle, Pa., to which is attached a belt 30 inches wide and $\frac{1}{4}$ inch thick. The above company have increased their capacity by an addition of ten new Nail machines, making a total of 75 nail machines now being operated by the firm.

Three new blast furnaces are to be erected near Birmingham, Ala., at a cost of \$700,000. The projectors of the enterprise are H. F. De Bardeleben, of Birmingham, and men from Charleston and Savannah. Work is to be begun immediately.

Machinery.

The Joliet Steel Company, of Joliet, Ill., have ordered an electric plant, using the Waterhouse arc and incandescent system made by the Waterhouse Electric and Mfg. Company, of Hartford, Conn. The Oregon Improvement Company have also purchased a combined arc and incandescent plant of the Waterhouse system, for the purpose of lighting their wharves, machine shops and railroad depot at Seattle, Washington Territory.

The machinery for the new steel Hoboken ferry-boat Bergen will consist of a triple expansion engine with cylinders measuring 18 $\frac{1}{2}$, 27 and 42 inches in diameter, with 24-inch stroke. C. H. Delamater & Co. are building the engines.

The Secretary of the Navy has awarded contracts for turning and boring lathes for the Washington Navy Yard as follows: For three lathes for 16-inch B. L. R. hoops, to Binns & Housechild, of Harrison, N. J., at \$45,000; for one lathe for

6-inch B. L. R., to Bement, Miles & Co., of Philadelphia, at \$19,950; for five lathes for 6-inch B. L. R. hoops, to Detrick & Harvey, of Baltimore, at \$15,342; and for five lathes for same to I. H. Johnson, Jr., & Co., of Philadelphia, at \$23,298.

The Deane Steam Pump Company, of Holyoke, Mass., have issued a small catalogue dated April, 1888, showing a number of engravings of their different pumps and giving brief particulars.

The Pennock Bros., car builders, Minerva, Ohio, have lately added a 100,000-Howe track scale, made by the Howe Scale Company, Rutland, Vt., to their works. At the natural gas center, Findlay, Ohio, the Howe scale is largely represented, and late contracts have just been completed with the Findlay Iron and Steel Company for 100,000-pound track scale, muck-bar scale and other smaller scales; also with the Briggs Edge Tool Works, David Round Chain Works, the Wetherald Wire Nail Company and David Kirk. Large Hopper scales were last week put in at Pompei, Mich.

A very interesting catalogue has just been sent us by the Thomson Electric Welding Company, of Lynn, Mass., referring at some length to their process of electrically welding different kinds of metal, and containing engravings of the machinery employed. The assured practical value of the process makes a perusal of their pamphlet desirable.

The Philadelphia and Reading Railroad Company have received from the Baldwin Locomotive Works six of the largest locomotives in the country. They are intended for the Frackville branch, and will weigh 75 tons or 168,900 pounds each. They will have the wagon-top boilers.

The Westinghouse Machine Company, of Pittsburgh, are building six large engines for shipment to Rome, Italy.

The partnership heretofore existing between S. H. Campbell and W. J. Boston, in the Cloud Foundry Company, of Allegheny City, Pa., was dissolved on the 26th ult. by the retirement of W. J. Boston. The business will be continued by the remaining partner.

At the annual election of the Heine Safety Boiler Company, of St. Louis, held on Saturday, the 16th ult., the following gentlemen were elected to constitute the board of directors for the ensuing year: E. D. Meier, Robert W. Hunt, Fred Suessdorf, Theo. G. Meier, Chas. F. Foster.

Messrs. Howard & Morse, 45 Fulton street, New York, have issued a circular, dated June 5, in which they direct attention to the fact that they have commenced suits against manufacturers and users of ventilating wheels infringing their patent for the Blackman air propeller.

Hardware.

The Rockford Bit Company, Rockford, Ill., are about to remove to Kokomo, Ind.

Cincinnati Wire Company, Cincinnati, Ohio, are at present shut down for repairs, but expect to resume the running of their mill in about a week.

E. C. Atkins & Co., Indianapolis, Ind., since the introduction of natural gas, which is being conveyed from a distance of 30 miles north of the city, have been using the fuel in all departments of their saw manufactory with excellent success, particularly in the tempering department, the furnaces in which have been entirely remodeled after designs patented by them. The change enables the company to produce a much more uniform temper and even flat surfaces for their blades.

Miscellaneous.

Among recently authorized corporations in Illinois are the following: The Empire Mfg. Company, of Rock Falls, to operate in agricultural implements and barb wire; capital, \$50,000; incorporators, John J. A. Zeller, L. E. Phelps, R. K. Swift and C. W. Parker. The Hydro-Pneumatic Mfg. Co., of Chicago, capital, \$100,000; to manufacture pneumatic and hydraulic apparatus; incorporators, J. W. Powers, F. Benoit, F. M. Weller, J. S. Hunt and J. B. Edwards. The Benjamin Machine Company, of Chicago, capital, \$50,000; for the manufacture of woodworking and other kinds of machinery; incorporators, R. B. Sample, H. M. Graham and R. W. Morrison. The Chicago and Calumet Rolling Mill Company; to manufacture, buy and sell iron and steel and the products thereof; capital, \$500,000; incorporators, John L. Pfau, Warren F. Pitney and Edward C. Starr.

A heavy vein of natural gas is reported to have been struck on the 27th ult. on the farm of Henry Marshall, in St. Louis County, 12 miles west of St. Louis. The gas was encountered at a depth of 1200 feet, and a flame 35 feet high is burning at the mouth of the bore. A company has been organized to pipe gas to St. Louis from Sparta, Ill.

About 250 brass workers, who for seven weeks were on a strike in two of the principal brass works of Cincinnati, declared the strike off on the 28th ult. The shops concerned in the strike are now free shops.

The Heine Safety Boiler Company have an order for two 85 horse-power boilers for the water works at Jefferson City, Mo.

The Worthington Hydraulic Works have sent two large pumps to the Missouri Pacific Railroad Company's coal mines at Rich Hill, Mo.

On Saturday, the 30th ult., the Northwestern Mining Company, of Brockwayville, Pa., gave notice of a 10 per cent. reduction in the wages of all miners and laborers, to take effect July 1. The company employ 1500 men.

Electric Motors for Naval Use.

Lieut. B. A. Fiske, writing in the *U. S. Army and Navy Journal* on "Motors for Naval and Military Use," says:

Three years ago the ability of electric motors to train guns was shown to the authorities in England, and since that time much progress has been made in perfecting the apparatus for applying electric motors to this kind of work. Little difficulty has been experienced, for though there is nothing that requires such accurate and rapid handling as a great gun in a seaway, there is no other engine capable of such accurate and rapid work as an electric motor, and its advantages over steam, hydraulic and pneumatic engines are so marked that it would be idle to compare them. The indications now are that we shall have at least one gun in the Chicago trained by electricity.

But it is not in the training of the guns alone that motors can be advantageously employed; they can also be used in elevating. In the Atlanta, when rolling from 10° to 20° each side, and from 10 to 12 times per minute, the line of sight of the guns sweeps past the horizon so fast, even near the end of a roll, as to require from the gun captain a rare degree of skill if we would have him shoot as accurately as such fine guns should be shot. The trouble is that the gun is beyond his control except in the matter of training, because the most that he can do is to wait for a favorable time of roll and catch the line of sight on the target as best he can. To use the gun effectively he needs some arrange-

ment by which he can put the gun on the target and keep it there, independently of the rolling of the ship. He needs some arrangement like the shoulder piece of the Hotchkiss guns, by means of which experiments on this ship have shown a very little practice enables a man to keep the line of sight almost exactly on the horizon or on any other object.

Electricity puts this power directly into the hand of the gun captain, for by means of a small electric motor on the elevating gear and a suitable switch he can raise, or lower, or stop the gun by simply moving his hand. The gun captain being able to train the gun to the right or the left, and to raise it up or down, the only thing left to do is to give him an electric primer, fired by means of an ordinary "push button," so that he can fire the gun quickly when the sights come on, instead of losing time by hauling on a lock lanyard. The advantage of this quick means of firing by using the electric primer stands out clear when we recollect that in a ship, say the Atlanta, which rolls in a seaway about 3° per second on the average, an error on the part of the gun captain of only $\frac{1}{10}$ of a second of time means a vertical error, on a target a sea mile distant, of about 31 feet. This remark applies, of course, only to the individual firing, and not to broadside firing by electricity, the advantages of which are not so palpable.

A very neat use for electric motors would be for hoisting ammunition. On board the Atlanta we use five men at each shell hatch, and their work could be done more quickly and quietly by a 2 horse-power motor costing, say, \$200. This would require one man to operate it, and would leave four men from each hatch for work at the guns. Coal could be similarly hoisted on board. Since all our new ships are fitted with dynamos for feeding electric lights, why not have them feed electric motors also, every horse-power developed by the motors being about the same thing as adding, say, nine 16 c. p. lights. Of course, the dynamos must be safe below the water line, and they must all be similar, and feed into the same main wires, which go all through the ship like gas pipes through a city, the incandescent lights, search lights and motors receiving their supply from these main wires, and one, two, or three dynamos being run at a time, according to the number of lights and motors in use. Nothing could be more simple and effective than such an arrangement, and nothing could contribute more to the efficiency, health and comfort of a ship.

The Merchant Steel Association.

A joint meeting of the Merchants' Association of the United States, which is composed of the crucible and open-hearth steel manufacturers, and the Bessemer Merchants' Steel Association, composed of the Bessemer steel manufacturers, was held in the Monongahela House, Pittsburgh, on Wednesday, the 27th ult. The meeting was fairly well attended, about two-thirds of the members of each organization being represented. After a full discussion on the present condition of trade was had it was resolved to make no change in the list of extras recently adopted by the associations. Business was reported to be rather dull, with no immediate prospect of an improvement. Nothing but routine business was transacted. The report published in some of the Pittsburgh papers to the effect that the meeting was held for the purpose of receiving the wage scales governing steel works to be presented by the Amalgamated Association is untrue, as neither organization deals with the labor question as a body, each member acting individually. The associations adjourned to meet in New York City some time during the present month.

The Iron Age

New York, Thursday, July 5, 1888.

Guns for the Army.

During the past few days an animated discussion has been going on in the Senate over an amendment to the Army Appropriation bill, emanating from the Committee on Military Affairs. The principal items of this amendment called for \$750,000 for the erection and purchase of buildings, machinery and tools for an army-gun factory at the Watervliet Arsenal, West Troy. It provides for an appropriation of \$5,000,000 for buying rough-finished steel forgings for 8, 10 and 12 inch guns, in quality and dimensions conforming to specifications, subject to inspection at each stage of the manufacture and including all the parts of each caliber. The successful bidder agrees to build a suitable plant and begin to deliver the steel for the smaller calibers at the expiration of not more than 18 months and that for the largest calibers at the expiration of not more than three years from the date of the acceptance of the contracts. It appropriates \$500,000 for submarine mines, for continuing torpedo service and for instruction in the torpedo service and \$100,000 for controllable torpedoes adapted to coast defense.

Considerable objection was at first raised to the amendment on the ground that it was not germane to the bill, but its relevancy was decided in the affirmative. The true character of the opposition was then developed in a speech by Senator Gorman, with whom Senators Plumb and Cockrell joined forces. In the absence of the full report of the remarks of the first named, which are not yet printed in the *Congressional Record*, the position can only be inferred by the replies it brought out. It appears to have been that it is wiser to await developments of inventive genius and private enterprise rather than to plan the work of providing for armaments and coast defense with the hands of army officials who do all they can to throttle progress which does not follow prescribed lines. The Missouri Senator opposed the appropriations chiefly on the ground that it is foolish to suppose that any foreign power will dare attack us, while the Kansas Senator read extracts from some mysterious authority who claims that the pneumatic dynamite gun has ceased to be experimental. This person asserts that the gun in question has a range of about 2 miles, "with the prospect that that range may be increased to 5 miles," and adds, "if ordnance officers were not a little impervious to the force of evidence, we should have had the solution of the harbor defense question settled by the general adoption of the gun."

The proposition to at last provide the United States Army with at least a few modern guns found its most powerful and best informed champion in Senator Hawley, who reviewed the history of the many

efforts made to reach a clear understanding of the most pressing requirements of the service and the best means of meeting them. The consensus of opinion of four or five boards and commissions in which legislators, army and navy officers and civilians have had a voice has favored the plan adopted for the navy and now proposed for the army—viz., purchase of the rough forgings from private establishments, and the assembling and finishing of parts at a government factory. While the navy has the right to advertise for the building of 148 modern steel guns, and has a good many of them under way, the army, with the exception of three or possibly four, has not a single piece of ordnance capable of resisting modern ships of war. The start which it is proposed to give this branch of the service would enable it to acquire in a number of years, 50 12-inch guns weighing 50 tons each, 120 10-inch guns of 30 tons, and 100 8-inch guns of 15 tons.

However opinions may differ on the different systems before the country, either in the embryo state of invention or in the more advanced stage of at least partial backing by experiment or trial, we should recognize the crying necessity of having a few weapons of modern power about which there can be no doubt. We have complacently looked on while other nations down to the minor States of South America and semi-barbarous Asian countries have equipped themselves to wage modern warfare, congratulating ourselves that they were paying for experience which would cost us nothing. We have proudly pointed to the brilliant record of American inventive genius coping with extraordinary problems in times of great emergency. Let it be granted that when the pinch does come some one, until then pitied and tolerated as a crank, will extricate us out of trouble by bringing out some new infernal machine. While it is being built and tested we have been at the mercy of any pugnacious third-class power. No one is less liable to get into complications with foreign countries, but nevertheless it may prove a very good investment to provide a modest equipment for the army, now that the small beginning with the navy is well under way.

Silver Coinage in Europe.

Some time since we referred to the decline in silver, and return to the subject because now, at the close of the first half year, the cause of the present depreciation begins to be better understood. There have been increased silver shipments to British India, the Straits Settlements and China; production has increased steadily and the demand for coinage purposes in Europe has diminished so far this year. Silver therefore has been unable to recoup the decline of 2½d since January 1, and present prospects for a rebound are anything but encouraging.

Last year was still a tolerably active coinage year in Europe; this year the demand for that purpose is so slack that neither the Bank of France, on behalf of the French Government, nor the Banque de l'Indo-Chine, Paris, have so far availed themselves of the decline to coin some silver dollars for Tonquin, probably because they expect a further decline in

the present condition of the Silver market, and the two institutions named are presumed to watch the silver market more closely than anybody else over there. The silver shipments to the East from January 1 to the middle of June were as follows:

	1888.	1887.
From London to India..	£2,483,333	£1,527,550
From London to China..	224,229	128,486
From London to the Straits.....	228,508	190,920
From Venice and Marseilles.....	233,197	942,009
Total.....	£3,169,267	£2,788,965
Increase.....		380,302

A glance at the operations of the European mints last year for purposes of coinage in the way of actual purchases of silver will enable us to form an idea of what is called in Europe a tolerably active year in this matter:

Silver Purchases by the Mints in 1887.

In	For	Francs.
France, Cochinchina.....		12,000,000
" Hayti.....		2,000,000
England, local fractional circulation		12,000,000
" the Colonies.....		5,000,000
Switzerland, local fractional circulation.....		1,000,000
Scandinavia, circulation.....		700,000
Portugal, ".....		5,000,000
Russia, ".....		3,000,000
Austria-Hungary, Maria Theresa thalers.....		6,000,000
Total.....		46,700,000

A reference to the different countries will give us a still better insight.

In France the colonial trade dollar is at the present price of silver only worth 3.77 francs, while the Mexican dollar is bringing 3.80. At no previous time did silver coin range so low in France. In England an extra effort was made last year in the way of coining silver for local purposes, including the famous jubilee 4-shilling pieces, £851,000 thus having been struck off. Now the United Kingdom has silver coin enough for several years to come, and this may also be said of the colonies whither fractional coin has of late years been shipped in large amounts. To Hong Kong, \$1,210,000 went last year, direct from the mint, and to the Straits \$79,000. Germany merely recoined 3,000,000 marks, and in Belgium the recoinage of 7,800,000 francs, commenced in 1886, was completed, and the profit of 500,000 francs made on that amount by the Government is set aside to figure as part of an offset against the eventual loss to be sustained on the amount Belgium will have to take off the hands of France when the Latin Union liquidates. Belgium will then receive about 250,000,000 francs, on which the loss to-day reaches the respectable figure of 75,000,000 francs. A more ruinous international concern than the Latin Union there certainly never was, if one of its smallest members is condemned to make such sacrifices.

Italy completed in 1887 the recoinage of 32,400,000 lire or francs of fractional coin. That country has still on hand 200,000 kg. of fine silver in the shape of old Neapolitan piastres, but has agreed not to recoin them into five-franc pieces. These piastres are a deposit in the vaults of the many issue banks as a reserve for bank-note circulation. On Feb. 29, 23,000,000 lire or francs were tied up in this shape. So far Italy has not been able to make up its mind to part with this accumulation of old piastres. Bankers have renewed their offers to the Government quite recently, but they were declined, the loss appearing too heavy. Switzerland, belonging to the

Latin Union, coined 1,400,000 francs last year, and had to buy 1,000,000 at Frankfort, but has now an ample circulation of fractional silver.

In Scandinavia only 500,000 crowns of 28c. American were struck off. Holland recoined to a moderate extent, only buying 180,000 guilders' worth of new silver, and Spain recoined 59,012,000 pesetas or francs' worth of old pillar dollars. Portugal coined 889,000 milreis, and Russia 1,500,000 rubles of a low standard. Austria-Hungary uses for its own circulation only domestic silver from its own mines, and continually shifts from bars to coin and *vice versa*, hence it exercises no influence through its mint operations on the silver market. The amount coined was 6,930,000 florins for Austria and 2,022,000 for Hungary. But, on orders received from Italy, Austria coined last year 3,175,000 florins' worth of Maria Theresa thalers for the use of the Italian expedition to Abyssinia, where this kind of coin has currency. A little silver was bought at Berlin to complete there the coinage of £435,000 Egyptian.

It will be seen that most of the European nations completed last year what there was still to be accomplished in the way of coinage and recoinage, which fact, we repeat, goes to explain the lack of demand for silver in that part of the world so far this year. In the absence of this element—usually an important natural prop—the near future of silver values appears all the more problematical.

The Salesman With Discretionary Power.

There are salesmen *and* salesmen. Many of them are fitted by nature and by experience to manage large interests, and their tact, judgment and knowledge of human nature enable them to succeed where others ignominiously fail. They can be given large discretion by their employers, who are confident that only in cases of absolute necessity will the lever of a lower price or an additional discount be pulled to secure an order. Other considerations will be brought into play by them, a sale at a good price being considered more of an achievement than a heavy order actually bought by a special inducement in cut rates.

It is an adage among salesmen that "any fool can sell at cut rates." If an inexperienced man, or one with limited resources has the power to name lower prices when necessary, he is very likely to think that every time he meets a buyer the emergency confronts him. If the buyer is indifferent, or is well supplied with goods, or prefers to wait for a week or two before deciding what to do, straightway the lever of a cut price is pulled and the power of that weighty influence is brought to bear. If the cut is deep enough, or if this is what the buyer has been playing for, a sale is effected and the salesman is happy, probably a great deal happier than his principal when the report of it is laid before him. In times of ordinary activity such a salesman will naturally do a large trade. Goods are moving, their places must be filled, and he is the very man all the buyers are looking for.

When trade is dull, however, and prices are dragging on the very bottom of abso-

lute cost, the salesman with discretionary instructions is a serious demoralizing element. He does not possess the power to build up trade for his own house, but is able to make matters very uncomfortable for his competitors. The nail trade can be taken as an illustration of this. Prices are exceedingly low—so low that many factories prefer not to run rather than meet the commercial conditions now prevailing. The demand for nails is quite limited, and the most vigorous drumming cannot induce purchases of more than a few carloads. Those who need stock will buy, and those who have a supply will not buy. At such a time it is useless to offer inducements of lower prices, as the sluggish current cannot be moved without some still stronger influence. Yet there are salesmen who persist in forcing nails upon buyers with ample stocks, and who are so short-sighted that they do not see the effects of that course communicated all along the line. Such salesmen should have their instructions remodeled, and it would probably not hurt very much if they were to be rebuilt of something in the nature of cast iron. This is a feature of the situation worth looking into by those who are anxious to improve the condition of trade, whether in nails or in other staple goods sold through salesmen.

A New Bar Iron Association.

Representatives of rolling mills in Ohio, Indiana, Michigan and Illinois, met at Cleveland, on the 27th ult., to form an association for the bar iron trade. The name adopted is "Association of Bar Iron Manufacturers." It is intended to regulate matters pertaining to the conduct of the iron business in order to secure more harmonious action among the manufacturers of the States named. No attempt is to be made to dictate prices or to order a stoppage of the mills. Nor will the question of wages be interfered with, and the signing of the scale is to have no place in its deliberations. It cannot be called a trust, as reported in dispatches from Cleveland to the Western papers, but it is simply an association of manufacturers like a great many other associations existing all over the country. Being a business association, its proceedings are private. Meetings are to be held subject to the call of the secretary or Executive Committee from time to time to discuss the situation of trade and to take such action as may be deemed desirable. While the report is incorrect that "each manufacturer agreed to regulate his output and to shut down when ordered and to leave prices to the association," yet an attempt will be made to keep prices steady by the more thorough interchange of information with one another and the investigation of reported low sales and cut prices before they are allowed to influence other transactions. The necessity for doing something to correct the condition of affairs in the bar iron trade is shown by the fact that bar iron has been sold on a parity with old rails at \$16, although they have not been bought laid down at the mill within \$2.50 to \$4 of this price. Further, it may be stated that, in previous periods of depression, when bar iron was sold so low, the card of extras was not cut completely in two as now, but full extras were obtained on many sizes. The follow-

ing permanent officers were elected: Myron C. Wick, Youngstown, president; S. A. Fuller, Cleveland, vice-president; C. W. Scofield, Cleveland, treasurer; George H. Taylor, Cleveland, secretary. The executive committee consist of Major Collins, Brazil, Ind.; James Neilson, Youngstown; H. O. Bonnell, Youngstown; J. S. Van Alstyn, Detroit; M. Churchill, Zanesville, Ohio; R. H. Lewis, Chicago. The details of the organization have not been entirely completed, but the promoters hope to secure the co-operation of at least four-fifths of the manufacturers of bar iron in the region covered.

Windmills for Electric Lighting.

With the extensive and constantly growing application of wind-power, specially noticeable in the West, where the windmill for pumping has become a familiar landmark, it is all the more noteworthy that this motor has not been pressed into service to any appreciable extent for isolated electric lighting on the storage battery plan. It cannot be because of lack of efficiency on its part, as the contrary is being demonstrated daily, and the low percentages of accumulated energy hitherto yielded by storage batteries may therefore, with some reason, be held accountable for the neglect which has been shown in the matter. Even this cause, however, if such it be, has of late lost in importance, the development and improvements in the manufacture of storage batteries having been such as to impart to them a reasonably high degree of efficiency. While the correctness of the remarkably economical figures claimed for some of the types now in the market may well be questioned, an average return of at least 60 per cent. of the electrical energy put into an accumulator may be expected, and with this a combined windmill and storage battery plant should, in certain locations, offer superior inducements as a means of supplying electric light. The power, strictly speaking, costs nothing beyond first cost of the motor and interest, the expenses of maintenance and wear and tear, and the sum involved in procuring the dynamo and batteries, whether in the shape of a price with interest, &c., paid for their purchase, outright or in the form of a fixed rental, paid to a controlling company. The necessarily fluctuating character of the power would scarcely be very objectionable since the energy would be stored whenever available, at intervals perhaps, in comparatively small amounts, a large enough storage capacity being provided, and drawn off when desired. The working expenses would be small and the power supply sufficiently reliable for the purpose to be accomplished. In only a few cases, however, that we know of has advantage been taken of the system, and then mainly for experimental purposes.

A record of the results obtained in one instance was given a few weeks ago in a paper presented to the Glasgow Philosophical Society, and, though rather incomplete, was none the less valuable because of its direct practical significance. Professor Blyth, the author, had fitted up a small windmill plant for lighting a cottage, the windmill being after old English type, erected in the garden. The tower consisted of a wooden tripod, suitably braced, and supported the wind shaft 33

feet above the ground; four sail arms were used, each about 18 feet long. The dynamo, also an old form, was driven directly through a rope and charged 12 cells. With this arrangement ten eight-candle power lamps were easily supplied, and, with a good breeze blowing, as we find it stated, there was sufficient storage in half a day to supply the lights for four evenings of about four hours each. A cut out arrangement disconnected the cells from the charging circuit when the dynamo ran below a certain speed, so that the action was entirely automatic and the windmill could be allowed to run day and night without danger of the cells discharging themselves through the dynamo. The possibilities of this plant, with all its imperfections, afford some measure of what might be accomplished with improved appliances and should encourage further work in the same line. With windmills of the latest type, storage batteries and dynamos of modern construction and a general improvement in all the working conditions, as now attained, additional experiments would be well worth trying.

Building Up New Towns.

We have frequent occasion to admire the enterprise which characterizes the inhabitants of the "new towns" of the country. They realize the necessity of calling the attention of adventurous spirits elsewhere to the opportunities still existing for the rapid accumulation of wealth. They appeal most strongly to the residents of the older East, whose surroundings have become more or less rigid by an apparent development of wealth-producing influences to a point of slow growth. Many turn anxiously toward some newer section of the country with the American hope in their breasts of "bettering their condition." The channel most convenient to reach these people sighing for a change of condition is the newspaper. Much is being accomplished by the press of the new towns in this direction. The "special editions" coming under our notice from time to time are almost invariably highly creditable to the towns whence they emanate. Whether they originate in the South or the West they breathe the true spirit of progress, and although too apt to exaggerate advantages and conceal defects they are a very important factor in securing a diffusion of population which is perhaps of as great consequence in this vast country as the direct pecuniary benefit of the individuals influenced.

This is not always a matter of real estate speculation, although it usually happens that holders of real estate profit most when a new town is started. We have in mind notable exceptions to this rule, in which the promoters of towns have discouraged all efforts at "booming," and have bent their energies in the direction of solid, substantial growth, leading to enduring prosperity. Towns depending for their existence upon the development of iron or coal interests have too frequently been the prey of the real estate boomer, who invariably points to Pittsburgh as an example of what coal and iron will do in building up a city, but forgets to say how many years it has taken and what other influences have played a very important

part. Alabama's Birmingham may be further cited as an instance of the wonderful growth, in a few years, of a rural hamlet to a vigorous city, solely because of the mineral resources of the vicinage, but it should not be forgotten or overlooked that there are few, very few, localities in this or any other country so richly endowed by nature with all the essentials for making iron.

Although but few towns in this country are destined to be great manufacturing centers of far-reaching influence in the production and manipulation of iron, there are countless numbers in existence and yet to spring up in which manufacturing will be prosecuted in a modest, unpretentious manner, with no special flourish of trumpets, but with sufficient vigor to vitalize the neighborhood and properly diversify occupations. These towns may not all produce the iron which they manipulate, but they may have special advantages of some kind for the manufacture of articles of more or less general use. Nor is iron the only consideration to be viewed in this connection, although it naturally occurs to us in the most prominent light, being connected with the iron trade, and besides that it underlies in its partial use such a vast congeries of other industries. The way is open in the South and West, which has long been traveled in the East, for the introduction of more and more occupations to the great advantage of the localities in which they are planted and to the ultimate benefit of the whole country.

Increased population and new industries must enter the new towns together. This is the mission of the enterprising advocates and local advantages and attractions to whom we are referred. They are striving to secure both influences, and the intelligent zeal with which the movement is conducted must result in an increased migration from our overloaded centers of population and our full-grown Eastern factory towns to these promising points of new life and more bustling enterprise.

During the past few years the whole German iron trade has resolved itself into a series of pools, rings and combinations who run, or attempt to run, the business at home and abroad. Occasionally, in the plenitude of their power, they develop a despotism which must be startling even to some of the staunchest adherents of the system. A striking example is furnished by a circular lately issued, signed by 20 pig-iron manufacturers of the Siegen district. It appears that a firm in Frankfort offered for sale 7000 tons of pig iron for delivery during the second half of 1888 at a price lower than that fixed by the combination. Their offers were disturbing the trade, and it is asserted that investigation showed that they were trying to sell what they did not own. Indignation ran high, and the 20 firms alluded to appended their signatures to an agreement by which they bound themselves not to sell any iron to the audacious firm for the balance of the year—in other words, the firm in question was boycotted solemnly.

The fact is recorded by the *National Car and Locomotive Builder* that a class of locomotives on the Wisconsin Central were noted for a jarring, uncomfortable rattle about them when running at high speed. A great many experiments were tried to

find out the cause of the annoyance, and it was generally supposed by experts to be in the running gear, but no change that was suggested made any difference. When Mr. John Player took charge of the road's machinery his attention was soon directed to the engines referred to and their jarring tendency was complainingly dilated upon. Mr. Player rode a few trips on one of the engines and watched her performance carefully. He concluded that the trouble was caused by the side rods being too heavy. The rod without the traps was 91½ inches long and weighed 198 pounds. He reduced the rod in size sufficiently to lower the weight to 153 pounds. This cured the jarring. The rods remained sufficiently strong for the work they have to do.

The Wheeler Patents.

A Company was formed last week in this city to manufacture and control the sale of products to be manufactured under the patents of Elbridge Wheeler, of Boston. Among the directors of the company are George A. Evans, representative in this city of the Bethlehem Iron Company; Hon. John H. Rice, of Worcester, Mass., and Elbridge Wheeler. The latter has been long identified with efforts to produce composite articles of iron and steel, and of different grades of steel. He has made some interesting products, among which bars of high carbon steel with a soft center are notable. The leading feature in connection with them as contrasted with compound bars, soft center plates, &c., being that there is no union between the two metals, that no weld is attempted. Among other articles a rail has been rolled a few weeks since at the Bethlehem Iron Works from such a composite ingot, the center being soft steel, while the surface is steel much harder and higher in carbon. It is claimed that such a product would combine the valuable properties of hard steel for wear, with the immunity from breaking which the mild steel center would give. A process which has in it the prospects of important developments is the sand core process, for producing annular and hollow shapes. Mr. Wheeler makes the core by filling a box of the proper shape with sand, around which the steel is cast, generally by bottom casting. He has found that ingots with a sand core can be rolled and hammered in the usual way, and samples submitted show that under the treatment the sand has been considerably pitted to a solid mass, the existence of which would aid the iron in resisting compression strains, like in pillars, &c. By allowing the sand to flow out, after casting and before rolling, annular blanks for tubes, hollow axles and shafting, &c., are readily obtained.

Composite Steamships.—In the notices which have appeared in English papers on naval architecture at the Glasgow Exhibition attention has been directed to the models of two composite screw steamers intended for the Newfoundland and Labrador mail service, and which, in their way, are decided novelties. Owing to the quantity of ice encountered in these waters during a great part of the year, the owners of the vessels determined to frame them with iron and sheathe the frames with stout hardwood planks, the latter material being, in their opinion, better suited to endure blows from the ice than ordinary thickness of iron or steel plating used in vessels of 700 tons. The bows of the ships are shod with stout iron plates, and the rudders are also of iron. Composite vessels, and particularly steamers, are rare; met with at the present day, and there, we are told, are the first vessels of the kind that have been built upon the Clyde for very many years.

CORRESPONDENCE.

The Number of Men Engaged in the Iron Trade.

BUFFALO, July 2, 1888.

To the Editor: Will you kindly inform us how many persons are employed in the iron trade in all its branches from miners of coal and ore and makers of coke to the finished product?

We may state that at the outstart we have no figures later than those of the Census of 1880, although they may be used as the basis of some estimate, as follows. The Census figures were:

	Product 1880. Net tons.	Men employed.
Pig iron.....	3,781,021	41,875
Iron rolling mills including nail.....	2,353,248	80,133
Bessemer and open-hearth steel works..	983,039	10,835
Crucible steel works..	75,275	5,196
Forges and Bloomaries.....	72,557	2,939
Total.....	7,265,140	140,978

For the year 1887 the following estimate may be made covering the same ground:

	Product, 1887. Net tons.	Estimate No. of hands same proportion.
Pig iron.....	7,187,206	80,125
Iron rolling mills.....	2,588,500	89,000
Bessemer and open-hearth steel works..	3,433,491	37,840
Crucible steel.....	84,421	5,820
Forges and Bloomaries.....	43,306	1,750
Total.....	13,336,924	214,536

From this probably at least 10 per cent. must be deducted to allow for the fact that a greater output is being made with less labor in all departments of the iron trade, and notably in blast-furnace work. This would leave it roughly 193,000 hands in the iron and steel works themselves.

The quantity of iron ore used in 1880 was as follows:

	Tons.
Blast furnaces.....	7,256,684
Rolling mills.....	363,959
Bess. and open-hearth.....	7,327
Crucible.....	2,128
Forges.....	79,610
Total.....	7,709,708

The number of hands employed in mining 7,064,829 tons of iron ore in the census year was 31,668. The output for 1887 is estimated at 11,800,000 tons, which would indicate a force of 50,600 hands.

In 1880 the consumption of anthracite coal by furnaces and rolling mills was 3,222,498 tons. In 1887 it must have been at least 4,000,000 tons. In 1880, 70,748 hands produced 23,621,371 tons of anthracite, which would indicate 10,000 men for the iron works' fuel in 1887. In 1880 the furnaces and rolling mills consumed 5,659,055 tons of bituminous coal. Taking into account the fact that the steel works used relatively little coal, and that natural gas is widely employed, the fuel consumption of 1887 may be roughly estimated at 5,000,000 tons. In 1880, 41,850,054 tons of bituminous coal gave employment to 100,116 men. We would have 12,500 men for the above quantity. Allowing for the introduction of coal-cutting machinery, &c., it may be put down at 10,000 men.

In 1880, 3142 men were employed in producing 5,359,489 tons of coke, of which 2,277,555 tons were consumed in iron works. In 1887 the consumption was probably not short of 6,000,000 tons, which would call for 3500 men engaged in the labor of converting coal into coke. The number of men employed in mining the coal for the coke may be roughly estimated as follows: Taking 63 per cent. as the yield of coal when making coke,

9,500,000 tons of coal would be required, which would call for about 20,000 men. Then there are at least 2000 men employed in quarrying limestone and over 1000 in making charcoal. We thus make the following total as a rough estimate:

	Hands.
Furnaces and rolling mills.....	193,000
Iron ore mining.....	50,600
Anthracite coal.....	10,000
Bituminous coal.....	10,000
Coking coal.....	3,500
Mining coal for coke.....	20,000
Quarrying limestone.....	2,000
Making charcoal.....	1,000
Total.....	290,100

It is safe to say that in raising the raw material from the ground and manufacturing into merchantable products the iron trade gives employment to about 290,000 men. This does not include any of the force employed in water or rail transportation. It does not embrace the wire mills, pipe works, foundries, boiler shops, bridge and structural-iron shops, &c.—

EDITOR.

Washington News.

(From Our Regular Correspondent.)

WASHINGTON, D. C., July 3, 1888.

The officers of the steel inspection service of the navy report that the supply of material for the cruisers Newark, Philadelphia and San Francisco and gunboats Concord and Bennington has been practically completed, and that those vessels will be ready for launching in a very short time. The cruiser Baltimore, at the Cramp yard, will be ready in about two weeks. The result of the completion of the hulls of this first batch of vessels has been of immense value to the metallurgical interests of the country. It has demonstrated that the United States Government is not dependent upon the steel-makers or the shipbuilders of foreign countries for the material or the ability to construct steel ships of war. In looking back to the beginning, and recalling with what almost despairing effort the manufacturers entered into the production of metal up to the standard requirements of the Navy Department, and how promptly they met the issue and triumphed in the best results in high-grade steel, we observe one of the greatest tributes to the energy, enterprise and skill of American producers. It is now said at the inspection office that the production of high quality steel is now accepted as a matter of course, and that the results show even greater skill in manufacture and application to other purposes.

The 6-inch steel cast gun is still undergoing the process of rifling and finishing at the Washington Naval Arsenal. It is not expected that it will be in condition to send to Annapolis much before September. The charge will be 50 pounds of powder and a 100-pound projectile. The greatest interest is manifested in ordnance circles as to how this gun will behave. It is now a question whether this gun shall be put to the statutory test only or be put to the full trial of its life by firing it until it bursts. Unless this be done the ultimate limit of its powers in this direction will be purely speculative. In a test of two 15-inch guns at Pittsburgh, one exploded at 500 rounds and the other at 550, firing as rapidly as the guns would be worked in action. The life of a cast-iron gun has been established at 1000 rounds and steel guns are expected to do even better work. In a cast-iron gun the closing of the right and opening of the left vent renews its effectiveness for an equal period.

The navy is now in possession of 5136 guns, including howitzers. A record of the work of each one has been preserved.

Of the new modern high-power steel guns 21 have been completed or practically so, and material for 148 has been ordered. The weights of these new guns, according to the ordnance figures, range as follows: 5 inch, 5000 pounds; 6 inch, 10,000 pounds; 8 inch, 27,000 pounds; 10 inch, 55,000 pounds; 12 inch, 100,000 pounds; and 16 inch, 100 tons. The latter sizes have, however, not yet been undertaken.

The two great armored ships will now soon be under way. The contracts for steel of the armored cruiser Maine, at the Brooklyn Navy Yard, to Carnegie, Phipps & Co., of Pittsburgh, show very satisfactory figures, viz., \$89,779 for steel plates, \$35,986 for steel shapes and \$9737 for steel rivets. The Pittsburgh Steel Casting Company furnish the steel castings for \$50,176. The contracts for hull material for the armored battle ship Texas will be awarded July 26. These will embrace plates, shapes, rivets and castings. The Texas will be built at the Norfolk Navy Yard. The naval officers are expecting the authorization of at least part, if not all, of the new ships provided for in the naval appropriation bills now before Congress. This will keep the work steadily moving along. By the end of the present year all the ships now contracted for will be afloat and ready for engines and armament.

The attack of Senator Gorman on the Ordnance Department of the army has naturally created a sensation. It was stated in official circles that most of what the Senator said was true. It is known that the ordnance branch of the army is far in the rear of the navy. The bold and aggressive stand of Senator Gorman will not stop at the burning of a little oratorical powder in the Senate. He will urge action upon the Department, where he expects to secure some changes which will bring this moribund branch into renewed youth and vigor.

A New Steel Company.—The Harvey Steel Company is a new organization which is about to purchase a site for a works at Jersey City, N. J., the organizers now having the refusal of two localities. The company consists of H. A. Harvey, president; Theodore Sturges, of the Oxford Iron and Nail Company, secretary; B. G. Clarke, of the Thomas Iron Company and the Lackawanna Coal and Iron Company, treasurer; Mr. Percy R. Pyne, of Moses Taylor & Co., being also interested in the concern. The company will build works to make steel under the patents of H. A. Harvey, who is well known as the inventor of machinery for the manufacture of cut and rolled wood screws.

The *Popular Science Monthly* describes a curious and ingenious device called "The Echo Maker," to be used on ships at sea. A flaring funnel is screwed to the muzzle of a rifle. When a supposed obstacle is near the vessel the rifle is fired in its direction, and if the obstacle is there the beam of sound projected through the funnel strikes the obstacle and rebounds, and as the echo is more or less perfect in proportion as the obstacle is more or less paralleled to the ship from which the gun is fired, and, as it is near or remote, the position of the obstacle may be inferred. The inventor claims that a sharp sound projected at or nearly at an object, and only when so directed, will in every case return some of the sound sent, so that, theoretically, there will always be an echo, and the difference in the time between the sound sent and the echo will indicate the remoteness of the object. The naval board tried the echo-maker and found that a return sound could be heard from the side of a fort $\frac{1}{4}$ mile away; from passing steamers $\frac{1}{4}$ mile off if broadside to; from bluffs and sails of vessels at about the same distance, and from spar buoys 200 yards away.

The Western Wages Contest.

The final meeting between the Conference committees of the Western Iron Association and the Amalgamated Association was held on Friday, the 29th ult., Mr. A. F. Keating presiding, and Messrs. James Neilson and William Martin acting as secretaries. Both sides argued in favor of the adoption of the scales presented by them. The manufacturers, through Mr. Keating, presented some additional facts and figures to show that it would be impossible for them to pay the present scale of wages and operate their mills. A detailed statement of prices obtained for their products now and prices obtained one year ago was presented which showed that a very great decline had taken place. Prospects for the coming year were also reported to be very discouraging. Orders are reported to be very scarce, while stocks on hand were reported to be very large. In view of these statements, which had been proven to the satisfaction of everybody present as representing the present condition of the market, the manufacturers would insist on the adoption of the scale previously presented by them. In behalf of the Amalgamated Association President Weihe stated that their people had submitted the case to the sub-lodges, and that a few of the manufacturers had been present at some of the meetings at which action was taken on the matter. The vote, he said, was nearly unanimous in favor of rejecting the proposition of the manufacturers. The lodges that did not vote to reject the scale left the matter in the hands of the Conference Committee. After Mr. Weihe had concluded the manufacturers retired. When they returned Chairman Keating reported that they had no further negotiation to offer, and adhered to their former scale. A motion was then made and carried to adjourn *sine die*. Secretary Martin, of the Amalgamated Association, stated that their scale would be printed and presented to the manufacturers for signature on Saturday, the 30th ult., in accordance with their usual custom. Those refusing to sign, their mills would suspend operations on that date. Notice has been received by Secretary Martin that two firms have already signed the scale, the Laughlin & Junction Steel Company, whose works are located at Mingo Junction, Ohio, and the Akron Iron Company, of Akron, Ohio, the latter concern employing about 500 men. A number of the concerns whose men are not controlled by the Amalgamated Association will continue in operation. Among these are the Black Diamond Steel Works, of Park, Brother & Co., Limited; Wm. Clarke, Son & Co.; the two mills of W. D. Wood & Co., Limited, at McKeesport, Pa., and Wellsville, Ohio; the Lake Erie Iron Company, of Cleveland, Ohio, and the steel works of Carnegie Brothers & Co., Limited, at Braddock, Pa. The Homestead Steel Works, of Carnegie, Phipps & Co., Limited, at Homestead, Pa., and the Twenty-ninth Street Iron Works, belonging to the same firm, also closed down on Saturday, the 30th ult., as did the Union Iron Works, of Carnegie Bros. & Co., Limited. Several conferences were held last week between President Weihe, of the Amalgamated Association, and General Manager R. W. Jones, of Carnegie Bros. & Co., Limited, for the purpose of arranging a steel scale for their works, but up to this time no scale has yet been prepared that is satisfactory to both sides, although it is so near adjustment that it will be signed at an early date. For the other works of Carnegie's outside of the Homestead mill the demands of the men have been acceded to after the adoption of modifications which are practically identical with those agreed to in the case

of Oliver Brothers & Phillips, to which we refer below. Both the Twenty-ninth Street Works of Carnegie, Phipps & Co. and the Union Iron Works of Carnegie Bros. & Co. start up Thursday.

A number of the manufacturers who were interviewed on the trouble all united in saying that they were better prepared this year than ever before to stand a lock-out, and that their mills would remain idle until their scale had been accepted. Job L. Boyer, of the Globe Rolling Mill Company, Cincinnati, Ohio, expressed his views on the situation as follows:

"The manufacturers are determined to insist on their scale. They have to do it. Necessity compels them. The iron mills of Pittsburgh haven't made any money during the past year; but they have been paying the 10 per cent. advance made last year. Now, when the situation is changed for the worse, the men are unwilling to come down. The Conference Committee admitted that one roller was making \$32 a day. I wouldn't care if I could make that myself. The head men are well paid, and probably can stand a lockout, but there is a host of laboring men who do not make more than from \$1.25 to \$1.50. These are the people who will suffer the most, but they are not considered. I must say that in Cincinnati we are not overstocked. I wish we had twice as much on hand as we have now. We will be satisfied, however, to shut down, because we have some repairs to make."

From present indications the lockout will be a prolonged one, although the situation is liable to change at any time. Considerable dissatisfaction is expressed both by the manufacturers and the public at the course pursued by the officials of the Amalgamated Association in refusing to meet the manufacturers half way in the matter and endeavor to arrange a compromise scale. Such a proposition was made by the manufacturers, but was rejected by the Amalgamated committee.

Oliver Brothers & Phillips signed the scale on Saturday, because they were obliged to keep their works running to fill a number of large contracts, among them one for a traction railroad. They signed after securing certain modifications. The item relating to crop ends was stricken out of the memorandum of agreement as follows: That for all crop ends on finishing mills used for merchantable purposes the same shall be paid for. The 1½ angles were changed from \$4.10 per ton to \$3.20 and 1¼ angles were changed from \$4.10 per ton to \$3.65, and the roll turners' scale was stricken out entirely. Oliver Brothers & Phillips' is a Clapp-Griffiths steel plant, and for the first time since it has been in operation a wage scale has been prepared and signed by the firm and the Amalgamated Association, which will govern the wages paid in these works. The scale is somewhat similar in its conditions to the iron scale, being in force from July 1, 1888, to July 1, 1889. There is one other Clapp-Griffiths steel works in Pittsburgh, and this is operated by the Spang Steel and Iron Company, the works being located at Etna, about 4 miles from that city. It is believed that a steel scale governing these works will also be agreed upon in a few days, and that no serious stoppage of the works will take place. This firm should not be confounded with that of Spang, Chalfant & Co., owners of the Etna Iron Works, also located at Etna. This firm have emphatically refused to sign the iron scale, and their works are closed down in all departments.

The other firms who have signed are P. H. Laufman & Co., Limited, of Apollo, Pa.; the Lockout Iron Company, of Chattanooga; the Findlay Iron and Steel Company, of Findlay, Ohio; the Aurora Iron and Steel Company, of Aurora, Ind.;

the Maumee Rolling Mill Company, of Toledo, Ohio; the Akron Iron Company, of Akron, Ohio, and the Republican Iron Company, of Pittsburgh. The latter starts up Thursday.

The trade is much divided on the question whether in reality any prolonged suspension of work is to follow. Although a good many manufacturers earnestly and sincerely believe that their only recourse in the present condition of the iron trade is to insist upon a reduction of wages, there are others who enter upon the contest with doubtful views as to its propriety. A leading manufacturer has stated that the low prices prevailing are due alone to the action of the manufacturers. It is stated that two weeks after the reduction of wages had been carried, the manufacturers would be as badly off as ever, since they would give away what they had secured in their efforts to secure business. It is not believed that the stoppage will have more effect than that which usually results from closing down for a few weeks to make repairs. Probably the first effect of a cessation of work for any length of time will be to relieve the Eastern markets of the pressure of competition from mills west of the Allegheny Mountains—a pressure which has been keenly felt during the past few months. At present relative prices East and West, even at cut rates of freight, very little if any iron can be sent West by Eastern mills. It would take a stoppage prolonged beyond July to lead to such shipments. Thus far only two important mills have signed the scale, the others being small, but stocks in the West are moderately large, and are regarded as ample enough to cover requirements for a few weeks. The opinion is expressed in the trade that the effect of the strike, if carried along through July, will be negative—that, in other words, it will avoid a further weakening, which would have followed the immediate signing of either scale.

Undervalued Steel Blooms.—A large quantity of imported steel blooms were sold on the 28th in New Albany, Ind., by the Custom authorities, for duties, freight, &c. This lot was a shipment on a sale of 5000 tons made some time since by Andres Joachams, of Charleroi, Belgium, to the New Albany Rail Mill Company. The rail mill bought the blooms at a very low price, through a local firm, acting as agent for the shipper, and the sample lot of about 20 tons came through the Custom House, undervalued, but the surveyor, knowing it to be only a sample, allowed it to pass, suspecting at the time some sharp trick. When the first regular shipment of about 400 tons came through, it was likewise undervalued, and was seized by the authorities for full duty, the rail mill having refused to pay the draft and receive the blooms, perceiving something crooked. Mr. Gathright, surveyor of the port of Louisville, states that Joachams has systematically defrauded numerous buyers through the country, the principal victim being a firm in Terre Haute, Ind., who, upon making a contract with Joachams for a heavy purchase of blooms, deposited a letter of credit in England, against which the shipper could draw with bill of lading attached. On each shipment after the papers had been officially approved, he would raise the amounts on the drafts, and, in this way, secured all the funds before half the goods were shipped. The entire lot in question was purchased by the Paddock-Hawley Iron Company, of St. Louis, for \$20.90 per ton, which is about \$8 below the market price, making about \$7000 including duty, charges and freight. The frauds of Joachams were first detected at the Louisville Custom House, and immediately reported to headquarters.

Foreign Markets.

Kilogram.....	220.5
Picul.....	134.

BRAZIL.

PARA. June 29, 1888.—*India Rubber.*—Our market has stiffened; there is little disposition to sell, the available supply not exceeding 20 tons. Receipts have been small, and are not expected to increase.—*Per cable direct.*

EAST INDIES.

MANILA, June 25, 1888.—*Hemp.*—There are buyers at \$8.31½ $\frac{1}{2}$ picul, against \$7.37½ same date last year, equaling $\frac{1}{2}$ ton, cost and freight, £28. 5/, against £25. 12/6. Clearances for the United States since last cable amounted to 8000 bales, against none last year, and since January 1 to 91,000 bales, as compared with 123,000 last year, the quantity loading being 8000, against none. Clearances for the United Kingdom, since January 1, have reached 168,000, against 98,000, while there are still loading 14,000, against 20,000; cleared for all other ports, 40,000, against 20,000; receipts at all ports since last cable, 15,000, against 9000; and since January 1, 298,000 bales, against 228,000 last year and 195,000 in 1886. *Freight*, \$5.50, against \$5, and *Exchange*, 3/5¼, against 3/5½ last year.—*Ker & Co. per cable direct to Chas. Nordhaus, New York.*

SINGAPORE, May 16, 1888.—*Tin.*—There have been no transactions in this market since the 2d inst., but in Penang business has been done for China up to \$35 $\frac{1}{2}$ picul. Sellers might accept \$40, and Chinese buyers would give \$35, but European shippers make no offers, and stocks in all quarters are accumulating. *Tonnage.*—Steamer rates to London are rather weaker, and a drop is not improbable. We quote weight at 27/6 @ 32/6. For New York via canal Tonnage is expected shortly, and some engagements are reported. Via Cape the Emily L. Boyd and W. Anton are offering room at 22/6 @ 25/, for weight. For Boston no fixture is yet reported. During the first four months shipments from the Straits to America were as follows during the years 1888 to 1883 respectively: 10,014 piculs, 28,004, 21,861, 12,689, 22,867 and 34,866. *Exchange* weak at 3/0¼.—*Gilfillan, Wood & Co.*

AUSTRALIA.

MELBOURNE, VICTORIA, June 15, 1888.—*Iron.*—The weakness in several articles has disappeared; all sell well at present at firm prices. We quote Galvanized Iron £17; Fence Wire, £10, and Scotch Pig, Clyde No. 1, £5.—*Per cable via Europe.*

MEXICO.

MEXICO, June 24, 1888.—*Drainage.*—The City Council has made a contract with the London-Mexican Prospecting and Finance Company for a 7 $\frac{1}{2}$ per cent. loan of £400,000, with 1 $\frac{1}{2}$ per cent. annuity sinking fund, at 82½, for the purpose of carrying out the drainage of the Valley of Mexico.—*La Libertad.*

JAPAN.

YOKOHAMA, May 10, 1888.—*Copper.*—The French syndicate have contracted for the output for three years of two of the leading Copper mines in Japan, amounting to seven-eighths of the total Japanese output. Baron Sadoine, the former general manager of Cockerill in Belgium, has recently visited China and Japan, and been instrumental in forming a Belgian syndicate for the extension of trade with Japan. The chief firms constituting such syndicate are the Angleur Steel Works, the Dyle-Bacalan Company, the Malines and Willebroeck Structural Iron Company, the Société Internationale de Construction, the metal firms Nicaise & Delcuve, Halot Frères, Caramin, Bael, and the Compagnie Générale des Conduites d'Eau.—*Echo.*

SPAIN.

BILBAO, June 16, 1888.—*Iron Ore.*—During the fortnight a better feeling has prevailed by degrees, leading to more doing. Still, business does not yet come up to what it was last year. Only a few single cargoes have been taken at 6/10 @ 7/8 Rubios and 7/6 @ 8/ Campanil. The latter is getting scarcer and scarcer through exhaustion; holders thereof are correspondingly firm. Total shipments since January 1 sum up 1,748,158 tons, against 2,113,369 same time last year. *Pig Iron* has been moderately active; the week's export has been 1749 tons, while 659 tons have been shipped coastwise.—*Bilbao Marítimo y Comercial.*

SWEDEN.

STOCKHOLM, June 21, 1888.—*Iron.*—At the instigation of the Swedish Export Association the sales office of Swedish Ironmasters has resolved to send a special agent to China and the East for the purpose of pushing in that direction the export of Swedish Iron.—*Dag-bladet.*

GERMANY.

HAMBURG, June 23, 1888.—*Iron.*—The scarcity and high price of Iron Ore at Siegen and Nassau sustains the Pig Iron quotations. The demand for Spiegel has been rather on the increase. Forge Pig has, on the other hand, been duller, yet sustained. Orders extend to September 1 next. Stocks are not large and not being increased just now, as the taking of inventories impends. Foundry Pig has remained as firm as before. Thomas sells with greater ease than Bessemer, but the latter still brings 54 @ 54.40 marks. Luxembourg is bringing 34 @ 38; English Bessemer, 42/ on the West Coast. Merchant is quiet, with a slightly improved domestic demand; still, production will have to be curtailed, the export still dragging, though perhaps slightly better. The demand for Boiler Plates is, if possible, brisker than at any previous time and prices have been raised to 170 marks and for Tank Plates to 150. Wire Rods for export have been reduced 5 marks $\frac{1}{2}$ ton, to facilitate exportation. The Wire-Nail convention has been prolonged, but it does not include the few leading concerns. Railway cars are doing well. Negotiations for the renewal of the Steel-Rail syndicate continue unabated. Advices both as regards Iron and Steel from Upper Silesia are of the most reassuring nature. *Metals.*—Lead has become very lively here and is looking up.—*Borsenhalle.*

Silicon in Tool Steel.

Dr. Friedrich C. G. Mueller, of Brandenburg, Germany, who has acquired the reputation of being among the leading authorities on metallurgical subjects in Germany, has lately added to his earlier investigations, the results being published in *Stahl und Eisen*, on crucible steel. He has probably been the first to call attention to the importance of silicon in the manufacture of that class of steel. In spite of the fact that it is well known that the best Sheffield steel often contains as much as 0.5 per cent. of silicon, some prejudice has existed against its presence in any quantity. Dr. Mueller determined to investigate the matter, and with the aid of Felix Bischoff, a steel maker of Duisburg, Germany, made and tested a series of high silicon steels, by additions of 15 per cent. ferrosilicon. Unfortunately the presence of 0.2 per cent. of phosphorus in this material made it impossible to use more than small quantities of it. Dannemora stock was used, containing only faint traces of sulphur, 0.006 per cent. of copper and 0.015 per cent. of phosphorus.

First four soft samples of steel were made for wood-working machinery, being hammered down to 1.77 to 0.24 flats. All of them were used for 10 months in planers in a factory for making picture frames, the foreman reporting that they were equal to the best English steel, and that no difference could be observed in grinding or working except that samples A and A' were a little harder. The chemical analysis of the samples showed the following compositions:

	Carbon.	Silicon.	Man-ganese.	Phos-phorus.
A.....	0.793	0.342	0.37

A more extended series of experiments made with silicon steel in the machine shop of Gebrueder Wiemann. A good hand at the lathe, skilled in preparing his tools, was given 1.18 inch square boss, with arbitrary marks. Both the proprietor of the works and Dr. Mueller watched his work constantly. The material for the analyses was taken by drilling from the tools in use so that Dr. Mueller knew their composition only after their behavior in work was known. Steels C and C', both inclusive, were made from the best, Danne-

mora stock, G being produced from cheaper Swedish stock for ordinary goods. This steel was tested with the object of ascertaining whether the effect of phosphorus becomes noticeable when it goes beyond 0.02. Finally analysis H represents the steel usually employed in the shop, bearing the name of a well-known Austrian maker.

All the samples were used for 15 months in doing work of the most varying kind in the lathe on iron, steel and cast iron. All proved to be first quality, D being the best, followed closely by E, which is a little softer. Both of them are ahead of anything yet known at the shop. Whenever larger contract work is to be done they are taken out and a depth of cut and speed is used with them which is otherwise considered dangerous. In cutting V-screws the point of the tool stands four times longer than with ordinary steel.

Steels C and C' are not far behind, C appearing to be a little more brittle. It is worthy of note that in these tests the slightly higher phosphorus contents of G did not effect it injuriously as far as observation went. Accidentally a surprising observation was made. A sample of the soft wood-planing tool-steel B' was kept at the machine shop. Without Dr. Mueller's knowledge it was used for a lathe tool and it was reported that a steam cylinder had been bored out with it, the edge remaining intact after 18 hours' work. Some mistake in marking was suspected, but a color test for carbon showed 0.6 per cent. and the silicon analysis proved that it was the identical steel. Afterward the same steel was used for working iron, and chiefly on screws, the report being that it was equal to C and C'.

The result of these investigations would indicate that silicon, to the extent of 0.8 per cent., has no deleterious influence upon the quality of crucible tool steel, and it may be true that 0.5 to 0.6 per cent. of silicon actually improves the quality.

Iron Ore at Wausau, Wis.—A large deposit of iron ore has been opened up near Wausau, in the central part of Wisconsin, which is reported to contain 67 per cent. of metallic iron and to be low in sulphur and phosphorus. The first train-load of ore was shipped from the mines on the 26th ult., and the occasion was celebrated by the citizens of the town with great enthusiasm. Ninety carts were loaded with ore, to be hauled to the cars, and the citizens formed in procession behind them and marched to the railroad, while a band took the lead of the line. After the ore had been formally loaded the party marched to a hall and partook of a banquet.

A correspondent of the United States *Army and Navy Journal* asks: "What is the longest piece of ordnance that has ever been successfully fired?" and receives the following answer. "If you include in the term ordnance everything that carries a projectile, we should answer 14 miles. This is the straight tube conveying natural gas from Murrayville to Pittsburgh. To clear this tube out a projectile known as the 'gum-ball' was inserted in the end at the gas well, closely fitting the interior; the gas was then turned on full force and the gum-ball fired through its full length, coming out at the further end in a few minutes."

In the construction of the Eiffel tower, at Paris, 2,500,000 rivets will be used.

Recent Legal Decisions.

TAXATION OF GOODS—COAL IN BARGES.

A coal company in Pennsylvania sent their coal down to Louisiana in barges for sale there; the coal was not consigned to any one, and the company had no agent there. The sheriff of one of the parishes levied on the coal which was in the barges in the Mississippi, it not having been landed, to sell it for the taxes which had been assessed upon it as property in the State. The company brought suit for an injunction to restrain the sale—Pittsburgh and Southern Coal Company *vs.* Bates—on the ground that the law directing the taxation was in violation of the commerce clause of the Federal Constitution. A preliminary injunction was granted, but on the hearing the suit was dismissed, and on the appeal taken to the Supreme Court of Louisiana the judgment below was affirmed. The chief justice, Bermudez, in the opinion, said: "Unnecessary pains have been taken to establish the elementary proposition that goods in transit from one State to another cannot be lawful objects of taxation during their passage in transportation in the State and through the States lying between that of the origin and that of the destination of the goods. There is no doubt that such goods cannot be taxed. But this coal is not in transit. The facts that it was kept on board the barges, or flats, which carried it, and was not unloaded, nor consigned, and that the company had no special agent in the State for its sale, are not material. It was sent down the Mississippi River to supply the Louisiana trade, and it reached its destination, and was offered for sale, and sold in part, and the rest is now for sale. In the case of *Brown vs. Houston* the Supreme Court of the United States decided that goods become the lawful objects of taxation the moment they reach their destination, where the statute provides for such taxation, for it cannot be seriously contended, at least in the absence of an act of Congress, that all goods which are the product of other States are to be free from taxation in the States to which they may be carried for use or sale. It is clear that this coal had become intermingled, on its arrival here, with the general property in the State of Louisiana, and is subject here, as all other personal property is, to taxation."

PARTNERSHIP DISSOLUTION.

P. & W. were partners and they dissolved their firm, with authority to each to sign in liquidation, and the notice of dissolution was published in the neighborhood paper. P. subsequently indorsed a note made by his brother "P. & W. in liquidation," and when it was not paid the holder, W., brought suit upon it and sought to hold the firm as indorser. W. defended on the ground that as the indorsement was made for the accommodation of P.'s brother, and not for the partnership purposes, he was not liable, he not having ratified the act of indorsement; but he was defeated because of the charge of the court, who said: "A note executed or indorsed by a partnership, whether during the existence thereof, or in liquidation by a partner authorized to use the firm-name in liquidation, is presumptively the act of the firm, and it devolves upon any member of the present or late firm who is sued upon it to show that it was not used for partnership purposes." The case, *Woodson vs. Wood*, on appeal to the Supreme Court of Appeals of Virginia was reversed. Judge Lacy, in the opinion, said: "If authorized verbally or in writing one of the former partners may bind the firm, after dissolution, as a party to a bill or note, but authority to settle or close up the business of a firm does not imply author-

ity to one partner, after dissolution, to give a note in the name of the firm for the firm's debt, or to renew one given before dissolution. Nor will authority to give or renew a note be implied by authority 'to settle business of the firm and sign its name for that purpose,' to use the name of the firm in liquidation of 'its past business,' or by the use of any similar expression. The instruction of the trial court was in conflict with the decisions on this question. Besides, it has been held that an indorsement on a note by a firm in liquidation is notice of the dissolution of the firm, which, of course, implies that a partner cannot be held as a partner; under the general law of partnership, for the acts of his former partner. The judgment must be reversed."

CONSIGNMENTS—BILLS OF LADING, WITH DRAFTS.

W, a produce dealer, at Batavia, N. Y., had for several years been in the habit of sending his property to Ege & Otis, commission merchants, New York City, to be sold by them. He consigned the produce and sent to them the original bill of lading; but he took from the railroad company a duplicate bill of lading, to which he attached a draft as against it, and had this draft discounted at a bank in Batavia. The drafts were often drawn without any particular regard to the value of the property described in the bills attached to them. This was the general course of business pursued by all of the parties, consignor, consignees and bank, and was acquiesced in. Between September 29, 1879, and February 18, 1880, W. made 145 consignments and drew 145 drafts; the first 135 drafts amounted to \$53,725, were accepted and paid and the entire consignment yielded but \$52,065.52. The last ten drafts were not honored, though the duplicate bills of lading were attached to them, and the bank brought an action of conversion for the value of the property represented by the bills of lading, as the consignees had appropriated it to their own use in payment of the overdrafts of the consignee. The bank contended that the consignees had no right to apply the proceeds of the sales of the property sent on these ten bills of lading to the payment of liabilities incurred through the acceptance of previous drafts. Plaintiff had judgment in this case—*First National Bank of Batavia vs. Ege*—for the value of the property, and the defendants appealed to the Court of Appeals, of New York, where the judgment was affirmed. The chief justice, Ruger, in the opinion, said: "We think that the contention of the plaintiff is the correct view of the question before us. The practice of carriers in issuing duplicate bills of lading to consignor for property shipped for sale has been much disapproved of by the courts, for the reason that it affords a convenient opportunity for the commission of frauds by consignors, as well as subjecting the carrier to the hazard of making incorrect delivery of the property. No question, however, arises in this case over conflicting claims between holders of respective bills of lading, as there can be no claim that defendants acquired title to the property consigned by virtue of the receipt of any bills by them. The possession of these bills gave defendants no title to the property described therein, but simply conferred the right upon them to receive it from the carrier, and hold it subject to an accounting with the consignor when sold, or to the owner when he should appear. By taking a transfer of a bill of lading from the consignor, and discounting a draft upon the faith thereof, the plaintiff acquired title to the property described therein, to the extent of the draft discounted, paramount to the claims of any other party. This would clearly be so unless such party had in good faith parted

with value in reliance upon the possession of the property lawfully acquired. When a consignee of property to sell accepts drafts upon the faith of the consignment, he acquires the right to sell the property, and apply its proceeds in payment of such drafts; but if such proceeds are insufficient for such purpose, he must rely upon the responsibility alone of the drawer to repay any deficiency. By the mere receipt of any subsequent shipment he acquires no lien thereon to the prejudice of those who have advanced money upon them, and taken transfer of bills of lading to secure such advances."

INDORSER—NOTICE OF PROTEST.

B. sued P. as an indorser upon a promissory note, and the declaration set out that no notice of dishonor was served upon P. upon the failure of the maker of the note to pay, because the note was made for the accommodation of P. A demurrer was filed and overruled in the case—*Blenderman vs. Price*—by the Supreme Court of New Jersey, and Judge Reed, in the opinion, said: "An accommodation note made for the convenience of the indorser, who alone has the interest to pay it, as between himself and the maker, and who must ultimately pay the note, is not entitled to notice of payment."

TRADE FIXTURES—RENEWAL OF LEASE.

A hotel was rented to C. by R. and he occupied it for 12 years, until 1880, when R. gave him notice to quit at the end of the year, but he did not give up the property. He took a written lease for five years, but in it there was no reference made to the fixtures he had put on the place during his tenancy just then expiring. The fixtures were such as are known in law as "trade fixtures." In 1882 C. died and bequeathed his interest in the lease to his wife, who continued the business until the expiration of the term, when she gave up the premises, and was about to remove these "trade fixtures." R. got an injunction to prevent the removal of these fixtures, claiming that they had been abandoned to him on the making of the new lease in 1880, and Mrs. C. carried the case—*Carlin vs. Ritter*—to the Court of Appeals of Maryland, where the judgment was affirmed. Judge Miller, in the opinion, said: "Under the decision it is clear that these fixtures were abandoned to the landlord. A tenant to protect his right to trade fixtures must secure his ownership during his term by removal or agreement."

The property of the Wynn Coke and Mining Company, near Uniontown, Pa., has been levied on by the Sheriff at the suit of the First National Bank of Uniontown on a claim of \$4100, money loaned the coke company. Labor claims for unpaid wages to the amount of \$1500 have also been filed, while a mortgage appears entered for \$9000. The works are near Oliphant furnace and are supposed to be worth \$25,000, comprising 85 acres of coal, 75 coke ovens and other property. The trouble was precipitated by the disappearance of A. B. de Saulles, the principal owner of the works.

The Pittsburgh coal operators are now considering the advisability of founding a pool by which retailers can only buy from members, also that all sales be registered at headquarters of the pool, and the latter will practically, like the coke syndicate, now defunct, make all sales.

The Deane Steam Pump Company will supply two pumps, each with a capacity of 2,000,000 gallons in 24 hours, for the seven Hale elevators that are to go into the new Lionberger building at Eighth and Washington avenue, St. Louis, Mo.

TRADE REPORT.

Pittsburgh.

Office of *The Iron Age*, 77 Fourth Avenue, {
Pittsburgh, Pa., July 2, 1888. }

The big lockout of the Iron workers has at last been inaugurated, and, with very few exceptions, the mills not only here in Pittsburgh but in the Ohio, Shenango and Mahoning valleys have been shut down. The Conference Committees had repeated conferences, and strong efforts were made to arrive at an understanding, but without avail; both sides refused to make any material concession, and a shut-down, therefore, was unavoidable. The Iron workers, or at least some of them, appear to be well satisfied with the situation, saying that they have for some years been advocating a vacation of a couple of months during the hot season, and they argue that it will be an advantage to the manufacturers, that it will enable them to work off their surplus stock and obtain better prices. Manufacturers, almost without exception, are determined to have cheaper labor or better prices for their product, even if for a time they do lose some of their trade to Eastern competitors. Pittsburgh manufacturers complain that they have been compelled to pay too much for skilled labor for several years; that they could not successfully compete with Eastern manufacturers who had a decided advantage over them in this respect. Dispatches have been received by mill owners at Youngstown, Ironton, and other points, stating that they also have shut down and will stand firmly with the Pittsburghers. This is perhaps the biggest shut-down ever attempted in this country, and it will be watched with a good deal of interest by business men. The Amalgamated managers appear to have but little doubt but what the manufacturers, after being idle for a time, will become restive at seeing trade going elsewhere, and that they will be ready and willing to accept the scale presented by the Amalgamated Association. The shut-down, it is said, will throw some 14,000 Iron workers out of employment, and will require a good deal of money and heavy assessments to keep up the strike.

Pig Iron.—There is no demand for Mill Irons, nor is it likely that there will be while the lock-out continues; the outlook is very discouraging for furnacemen, and some not already out will blow out their furnaces just as soon as they work what they have on hand. The demand for Bessemer appears to have fallen off, and it is evident that large buyers on the market the past two or three weeks have been supplied; prices, however, are still maintained at the recent advance. We can report a sale of 1000 tons at \$17.25, four months, which may be regarded as the milling price for standard brands. Foundry Irons continue dull. Not for many years has the market here been in so bad a condition as at present, and the outlook is not bright for an early improvement. All the Iron taken by the foundries and Steel works is scarcely a drop in the bucket as compared with the consumption of Mill Irons. Mill owners have been buying little or no Iron for some time past, and it is certain, now that their mills are stopped, they will buy none at all. We quote prices as follows:

Neutral Gray Forge.....	\$14.00 @ \$14.50, cash.
All Ore Mill.....	15.00 @ 15.50 "
White and Mottled.....	13.50 @ 14.00 "
No. 1 Foundry.....	16.50 @ 16.75 "
No. 2 Foundry.....	15.75 @ 16.00 "
No. 1 All-Ore Foundry.....	17.00 @ 17.25 "
Charcoal Foundry.....	22.00 @ 24.00 "
Cold Blast Charcoal.....	25.00 @ 26.00 "
Bessemer.....	17.00 @ 17.15 "

Muck Bar.—Continues dull and prices are nominal at \$26 @ \$26.50, cash. There is little or no demand.

Manufactured Iron.—Some mill owners managed to work up a fair stock of Assorted Iron before shutting down, while others were less fortunate. However, as the demand is exceedingly light, it is probable that manufacturers will be able to meet the wants of their customers for some time to come. Prices remain unchanged, and we continue to quote upon a basis of \$1.70 @ \$1.80 for Bars, 60 days, 2% off for cash.

Nails.—There is little or no change to note in the Nail market. Trade continues slow and very unsatisfactory, while prices remain unchanged at \$1.90 for 12d to 40d in carlots and upward, and 10¢ per keg additional for small lots. It is intimated that the card price is being "cut," but to what extent or whether it is so or not we cannot state.

Wrought Iron Pipe.—Trade has not improved since our last report; if anything, it is growing worse instead of better. But few, if any, of the mills are working up to anything like their full capacity. Some are standing idle. As to prices, they are too unsettled and irregular to quote.

Old Rails.—Like Pig Iron, are very dull; demand has been exceedingly light for some time past, and there will be no improvement as long as the mills are standing idle. However, stocks are by no means excessive, and prices remain as last quoted: \$21 @ \$21.50 for American T's. There is some inquiry for Old Steel Rails, with but few offers.

Steel Rails.—The Edgar Thomson Works are still working full time, and it is said have enough orders booked to keep them going for 60 days. Prices are quoted at \$31 @ \$31.50, cash, at mill.

Billets, &c.—There is a fair business in Bessemer Steel Billets, which may be quoted at \$28, cash, at makers' works in Pittsburgh. Nail Slabs, \$27.50 @ \$27.75 at makers' works. Sale of Domestic Crop Ends at \$17.25, cash.

Merchant Steel.—There was a meeting of the Bessemer Steel men a few days ago, but there was no change made in prices. Tool Steel, 8½¢; Crucible Spring, 4½¢; do. Machinery, 5¢; Open-Hearth Machinery, 5¢. The Steel works of Singer, Nimick & Co., have been closed, the employees refusing to accept a reduction in wages of 10%.

Railway Track Supplies.—Continue dull, while prices remain unchanged: Spikes, 2¢ @ 2.10¢, 30 days, delivered; Spike Bars, 1.75¢ @ 1.85¢; Track Bolts, 2.85¢ with Square and 2.95¢ with Hexagon Nuts.

Old Material.—Of all kinds is dull and prices are weak and in buyers' favor. No. 1 Wrought Scrap, \$19 @ \$20, net ton; Wrought Turnings, \$12 @ \$13; Car Axles, \$23 @ \$24; Cast Scrap, \$15 @ \$15.50, gross; Cast Borings, \$11.50 @ \$12; Old Car-Wheels, nominal at \$19 @ \$20.

Chicago.

Office of *The Iron Age*, 95 and 97 Washington St., {
Chicago, July 2, 1888. }

Pig Iron.—The market generally has been inactive, although sales of a considerable quantity of Bessemer and Southern Coke Pig are reported. Less is being heard now of the competition of the cheapest grades of Southern Iron, as the supply has been largely absorbed here and at other centers of consumption. Advices from Cincinnati, privately received, state that fully 20,000 tons more of No. 2 Mill could have been sold there last week if it could have been obtained. The cleaning up of this grade of Iron removes a serious

element in the demoralization of prices, and the effect is already seen in several directions. A sale of No. 1 Southern Coke is reported on good authority to have been made at \$17.75, cash, f.o.b. Chicago, which indicates a return to better prices. Freight rates on Pig from Southern points were also restored on the 25th ult. to within 15¢ of the rates ruling before the recent cut. Lake Superior Charcoal and Ohio Softeners are not moving freely at present, but inquiries from manufacturers of Agricultural Implements are being received, and it is intimated that the excellent crop prospects will make the demand from this class of consumers heavier than usual. Quotations are as follows, for cash, f.o.b. Chicago: Lake Superior Charcoal, all numbers, \$19 @ \$19.50; Alabama Car-Wheel, Nos. 1 and 2, \$25.25; do., Nos. 3 to 6, \$26.25; Southern Charcoal Foundry, No. 1, \$18; Jackson County Softeners, No. 1, \$17.75 @ \$18; Hocking Valley, Soft Foundry, No. 1, \$16.50 @ \$17.50; American Scotch (Blackband) No. 1, \$18.50 @ \$19.50; other Ohio Scotch Irons, No. 1, \$17.50 @ \$18; Lake Superior Coke, No. 1, \$17 @ \$17.50; No. 2, \$16 @ \$16.50; No. 3, \$15 @ \$15.50; Southern Coke, No. 2, \$17 @ \$17.25; No. 2½ and Open Bright, \$16.50; No. 3, \$15.50; No. 1 Mill, \$14.50 @ \$15.50.

Bar Iron.—Some of the agricultural implement manufacturers are asking for quotations on a full year's supply, but beyond this nothing has occurred worthy of note. Prices are irregular, with the possibility of a long stoppage of Western mills, and although some brands of Common Iron can be had at 1.60¢, f.o.b. Chicago, half extras, most sellers are quoting 1.62½¢ @ 1.65¢, subject to strike. Prices from store are still 1.70 @ 2¢, according to quantity and quality.

Structural Iron.—The prominent feature of this branch of trade is the increasing number of orders for bridgework, the season now being fairly opened. Beams for building purposes are also selling well in a retail way. Store prices for Angles are: 2.40¢ @ 2.70¢; Tees, 2.60¢ @ 2.90¢; Beams and Channels, 3.80¢. Prices on carload lots from mill, f.o.b. Chicago, are as follows: Angles, 2.12½¢; Universal Plates, 2.17½¢; Tees, 2.42½¢; Beams, 3.40¢.

Plates, Tubes, &c.—The Plate trade has been very satisfactory both in small lots and mill orders. In fact, the business of the entire month has been above complaint, the leading dealers reporting a considerable gain in value, which, of course, means a heavy gain in tonnage over the corresponding month of last year. Prices are strong with an upward tendency, as follows: Heavy Sheets, Nos. 10 to 14, 2.60¢ @ 2.70¢; Tank Iron, 2.50¢ @ 2.60¢; Tank Steel, 2.75¢ @ 3¢; Shell Iron, 3¢; Shell Steel, 3¢ @ 3.25¢; Flange Iron and Steel, 4¢; Fire-Box Steel, 4.75¢ @ 5.75¢; Boiler Rivets, 4¢ @ 4.25¢; Ulster Iron, 3.75¢; Boiler Tubes, 60% and 10% off on 2½-inch and larger and 62½% off on 2-inch and smaller. The low prices on Tubes are attracting buyers and increasing sales are reported, but manufacturers are chary about taking large orders at these rates.

Sheet Iron.—Another week of good business is reported by the agents of such mills as are able to take orders, and they now quote No. 27 Common Black at 2.90¢, f.o.b. Chicago. Store prices are unchanged at 3.30¢ for No. 27. If the Western mills are closed for any considerable length of time by the wages controversy, prices will inevitably advance materially.

Galvanized Iron.—Although the legitimate demand is about the same as it has been, apprehensions of a long stoppage of the mills are causing increased inquiry

from buyers. Manufacturers' agents are, however, in no haste to dispose of their spot stocks and are withdrawing special cash discounts. Small lots are quoted at 60 % and 5 % off for Juniata and 60 % and 10 % off for Charcoal.

Merchant Steel.—Business is quiet, with no change in prices.

Steel Rails.—So far as can be ascertained, no orders of importance have been placed here during the week. Negotiations are pending for round lots with some prospect of an early decision. Orders are known to have gone East recently because deliveries could not be arranged by local mills to suit purchasers. Indications favor an increased business for the fall months, but prices show no improvement. Quotations are still \$31.50 @ \$32.

Old Rails and Wheels.—Holders of Old Iron Rails are asking \$19, but the mills are not inclined to buy with the prospect of a general stoppage of work, so that no transactions are reported. Old Car Wheels are in slight demand at about \$19. The only sale coming to light is one of 200 tons by a railroad company direct to a consumer at \$18.50.

Scrap.—With very light transactions, quotations are nominal. Mixed Country Scrap is still worth about \$12, while dealers' selling quotations range about as follows, per ton of 2000 lb: No. 1 Forge, \$17 @ \$17.50; Track, \$16; No. 1 Mill, \$12; Light Wrought, \$8.50 @ \$9; Horseshoes, \$15.50; Axles, \$21.50 @ \$22; Cast Machinery, \$12.50 @ \$13; Stove Plate, \$9; Cast Borings, \$8.25; Wrought Turnings, \$9; Axle Turnings, \$11; Coil Steel, \$13; Leaf Steel, \$14; Locomotive Tires, \$13.

Hardware.—Jobbers have found the business of the week excellent for the season. All kinds of goods have been in demand, particularly Builders' Hardware. A great deal of building is going on in many of the Northwestern towns. A very heavy business was done in June in Window and Door Fly Screens, exceeding that of any former season. Collections are good, being reported fully up to the average.

Nails.—Manufacturers' agents report the demand slightly reviving, some fair sales having been made during the week to large buyers. Prices have receded a little, Steel Cut Nails now being quoted at \$1.90, f.o.b. Chicago, from factory. Jobbers have experienced a very good trade in both Cut and Wire Nails, activity in building causing a demand for quick consumption. They quote small lots at \$2.05 @ \$2.10 for Steel and \$2.50 @ \$2.55 for Wire Nails.

Barb Wire.—Jobbers report but light sales, farmers now being actively employed in attending to growing crops and not building fences. They quote small lots at 3¢ @ 3.10¢ for Painted and 3.75¢ for Galvanized.

Forsyth, Hyde & Co., of Chicago, have been appointed sales agents for the Northwest for the Brierfield Iron and Coal Company, of Brierfield, Ala., makers of the Bibb brand of Coke Pig Iron.

The North Chicago Rolling Mill Company, of Chicago and Milwaukee, have issued a very acceptable pamphlet to the Iron trade. It contains 20 pages, is of vest-pocket size, and is covered with heavy paper, having lithographic designs on the front and back. The contents embrace, first, a list of the sizes of Flats, Half Ovals, Half Rounds, Car-Truck Channels, Ovals, Wagon-Box Irons, Rounds, Squares, Car-Link and Car-Tin Irons and Angles rolled at Milwaukee, June 1, 1888; second, the standard list of extras on Bar Iron; third, list of sizes of Steel Plow-Beam Billets,

Steel Cultivator Beams, Light Iron and Steel Rails from 8 to 35 pounds, Splices and Bolts, Steel Street Rails, O. G. Tires, Fish Plates, Car Iron, &c., made at Milwaukee; fourth, the Steel classification of extras adopted by the Bessemer Merchant Steel Association, December 1, 1887; fifth, the new national Cut Nail schedule adopted June 6, 1888; sixth, tables showing number of Cut Nails to the pound and lengths of various sizes, tons per mile of Rails of various weights, weight of rolled Iron (round, square and flat), and information regarding railway supplies used in laying track; seventh, description of Bay View Pig Iron. The North Chicago Rolling Mill Company, established in 1857, now have a capital of \$6,000,000 and operate blast furnaces and a Steel Rail mill at North Chicago, Ill., blast furnaces and a Steel Rail mill at South Chicago, Ill., and blast furnaces, bar mills, Nail factory, puddle mill and Fish-Plate mill at Milwaukee, Wis., with a total annual capacity of 100,000 tons of Bar Iron and Fish Plates, 400,000 tons of Pig Metal, 350,000 tons of Steel and Iron Rails and 15,000 tons (300,000 kegs) of Nails.

Philadelphia.

Office of *The Iron Age*, 220 South Fourth St., PHILADELPHIA, PA., July 3, 1888.

Pig Iron.—The close of the first half of 1888 shows it to have been a most unsatisfactory one to the makers of Pig Iron. Prices opened at from \$20.50 to \$21 at tide for No. 1 Foundry, and at about \$17 for Gray Forge, drooping from that time to the present without a single reaction, although the most important declines were in May and June. These changes are largely due to a natural reaction from the extraordinary activity of 1886 and 1887, although tariff agitation and the political position generally precludes the possibility of any important ventures being taken up at present. Who, for instance, is willing to take the risk of entering into a large contract, while there is a possibility of foreign material being brought in at several dollars per ton less than American Iron can be made for? Another reason for the steady decline is the encroachments made by Southern and Western Irons. Whatever prices were made for Lehigh or Schuylkill Irons early in the year were almost invariably cut under by furnaces at a distance. Western irons have made the biggest inroads, and are now the most serious competitors owing to their superior quality. Southern Irons were heavily sold earlier in the season, but since the price of Pennsylvania brands have been cut down there is comparatively but little competition, and sales during the past three or four weeks of no importance whatever. It is understood, however, that several new furnaces (Alabama) are to be blown in some time within the next six or eight weeks; and it is therefore not unlikely that a portion of the output will find its way to this market, although to start in with it will have to be at very low prices. It is a peculiar feature that during the earlier periods of manufacture in the South a good deal of the product comes this way, but later on they find a market for it at home, or else displace Iron in the West, which in its turn finds its way into Eastern markets. In regard to the future, the outlook is not such as can be very clearly defined. In some respects there are encouraging features, in others quite the reverse. For several days past the feeling has been gradually veering around toward improvement, and at this writing the tone is hopeful, although somewhat nervous, owing to the uncertainty of things in the West, and in regard to the tariff. On the bright side, we find light stocks, and a demand

pretty well up to the current output, very low prices, and prospects that favor expectations of an increasing consumption as the season advances. A large amount of business is said to be waiting for a decision in regard to the tariff, while the ordinary demand promises to be at least equal to that of the first half of the year. The situation in the West is not regarded as likely to be serious, and it is believed that by the middle of the month work will be going on as usual. Assuming that this will be the case, and that tariff matters will also be satisfactorily arranged, the chances seem to favor gradual improvement, while in the event of a change in the administration a decided and marked advance all along the line might very safely be predicted. On the other hand, a protracted suspension of work in the West, or any material changes in the tariff, would be just as certain to act unfavorably on Pig Iron, and more or less demoralize the entire market. So long as these matters are unsettled operations will virtually be kept within the smallest limits possible; and as no human foresight can determine for certain what the outcome will be, it is not to be expected that things can be other than they are—nervous and unsettled. The current output of Pig Iron is estimated to be about 10,000 tons per week less than it was six months ago; and as there are no intimations of any important increase so long as the present low prices rule, stocks will in all probability be kept well under control. The first quarter of the year passed without any quotable change in prices, but toward the end of April a good deal of weakness was manifested, and orders were placed at about 50¢ per ton reduction. By the middle of May the Thomas Iron Company announced \$2 reduction on Foundry Irons, since which date, up to about the middle of June, the market was unsettled and weak, but about that time the adjustment of values seemed to be complete and each brand settled to a point beyond which concessions were firmly refused. Since that date to the present the feeling has been of a more settled character, and, in the absence of new elements of disturbance, the general opinion is that the tendency will be slowly, perhaps, but surely, toward improvement. Prices to-day range from \$18 to \$19 at tide for No. 1 Foundry, \$17 @ \$17.50 for No. 2, and \$15.50 @ \$16.50 for Gray Forge, according to brand, quantity, delivery, &c.

Manufactured Iron.—The remarks made in regard to Pig Iron would apply almost equally well under this heading. Prices seemed to have varied with the raw material, being without quotable change during the first three months, but steadily weakening after that up to within about two weeks ago. The falling off in consumption has been very great, compared with either the first half or the last half of the previous year, which statement fully explains the continuous weakness in prices. Each mill naturally tried to run full time, and, in attempts to secure business, prices have been cut almost to the lowest on record. In addition to this, competition from the West has been very strong, and many of the largest orders were carried off, chiefly by Pittsburgh concerns. The result has been unremunerative prices and unwillingness on the part of consumers to take more than small lots at a time, fearing that quotations might go still lower before the reaction came. The falling off in consumption has been largest in Skelp Iron, although the Bar trade has suffered to some extent. Tank Iron, too, has been in very light demand, although Ship Plate and Boiler Iron have in some measure offset the loss, the demand for that class of material having been very satisfactory. But the constant urgency to sell has kept prices at a low point, and if first cost has

been cleared during the past three months it is about all that can be expected. The outlook seems to be a little better at the moment, but until there is some certainty in regard to the outcome of the labor question in the West it is impossible to form any definite opinion on the subject. Meanwhile sellers ask about \$1 75 ton advance, but would not be likely to accept large orders even then. A general resumption of work in the West, however, would act unfavorably, as buyers easily take fright. A suspension for three or four weeks would probably place things on a firm basis, as the disposition is to take a cheerful view of things, which would be vastly improved providing the pressure to sell was removed for a short time. The highest quotations appear to have been made during January, Bars at 1.95¢; ordinary Plates, 2.15¢ and Grooved Skelp, 1.9¢ @ 1.95¢. During April, May and June Bars sold down to 1.8¢ @ 1.85¢; Plates to 2¢ and Skelp to 1.8¢, although in many instances even the lowest figures were shaded in special transactions. At this writing, owing to so many mills being closed, asking prices are firmer at 1.85¢ @ 1.9¢ for Bars; 1.85¢ for Skelp and 2¢ @ 2.1¢ for Plates, but the feeling, for reasons already stated, is nervous and unsettled.

Steel Rails.—The Steel Rail market has been so thoroughly discussed in our New York reports that there is but little to be said at this time. Sales to date for the year are estimated to be about 900,000 tons, which, in round numbers, represents a falling off in sales of about 750,000 tons for the six months, as compared with 1887. Prices average from \$8 to \$9 75 ton lower than they were at this date a year ago, and about \$2 lower than they were six months ago, quotations being \$38 @ \$39 in July, 1887, \$32 in January and \$30 to-day. The outlook for the next six months is not encouraging as regards Rails, although the increasing demand for Steel in other forms is an important offset to the shrinkage in the Rail trade.

Old Rails.—It would be hard to find a period in which so little business was done and with so few changes in prices as during the past six months. They were quoted \$21 @ \$22 for T's six months ago, and are nominally the same to-day, a few unimportant transactions having been made during the period under review at \$20.50 @ \$20.75, most of the sales having been at \$21 @ \$22. The supply is light and the demand equally so, and at the moment there are no indications of change either for higher or lower figures.

Wrought-Iron Pipe.—During the past six months demand has not been up to expectations and prices have been very disappointing. The year 1887 was remarkable for the very large trade in this particular line. Natural gas companies were the largest consumers, and the mills were unable to turn out the stock fast enough, being compelled to work day and night a great part of the time. Prices, too, were held without much difficulty, and in giving an order the buyer was more particular as to time of delivery than to price, generally leaving the mill to arrange the latter. Since the first of the year, however, trade has been quite the reverse of 1887. Demand has gradually fallen off and prices weakened accordingly. Orders received from the natural gas companies are in some cases probably 50 % less than they were a year ago, while several new mills have been erected, adding largely to the productive capacity, and to secure trade these new comers were compelled to cut prices. Add to this the unsatisfactory condition of the Iron trade in general and the natural result is light demand and uncertain prices.

Chattanooga.

Office of *The Iron Age*, Ninth and Carter Sts.,
CHATTANOOGA, TENN., July 2, 1888.

Pig Iron.—The condition of the market remains about the same as last reports and is far from being on a satisfactory basis. Prices are very irregular, and so far as making any quotations are concerned, that is entirely out of the question. Some of the new furnaces are making sales of large lots at outrageously low prices, which must certainly be below cost, and they are making contracts for future deliveries extending far toward the close of the year about on the same basis. On the other hand, most of the old plants are under contract for nearly all of their product. These contracts were made when Iron was much higher than it is now, and, of course, these furnaces are running along quite regardless of the fall in prices. The general opinion seems to prevail that there will be no change for the better until the policy of the general Government on the tariff question becomes more settled, which, of course, cannot be determined during the present year. In addition to this come the anticipated strikes of the workers of Pig Iron and the hot weather of midsummer, during which many of the mills suspend operations, strike or no strike. As yet we do not hear that any of the Southern stacks contemplate blowing out, nor even those that are in course of construction suspending operations, but they are pushing their work forward as fast as possible. There appears to be no doubt, however, but what the present year will develop those that have the longest purses, as well as those that can make Pig Iron the cheapest. Freight remains unchanged since the last deal, \$2.25 to Cincinnati and Louisville and \$3 to St. Louis from this point.

Louisville.

LOUISVILLE, KY., July 2, 1888.

Pig Iron.—There has been no decline in the market since last report. Indications report steady buying at present prices. If it was not expected that several new furnaces would be offering their Iron during July, prices would slightly advance, as the older furnaces are largely sold ahead, and are only offering small lots of off-colored Irons. Buyers continue to make inquiries for deliveries running throughout the year and in some instances for 12 months, and sales have been made on this basis. Among the new furnaces, the DeBardeleben, Pioneer, Sheffield and Nashville are placing their Irons on the market, and their product is spoken of with favor. It is expected that No. 1 of the Sheffield and Birmingham Coal, Iron and Railroad Company's furnaces will be in blast next week, to be followed by No. 2 and No. 3 during the next 60 days. It is thought their Iron will be a most excellent one, as the Ore used is brown, and a portion of their coke will be Pocahontas, whose excellent qualities are well known. Some of the furnacemen think that the continued inquiry on the part of buyers for large quantities of Iron for future delivery indicates that the market will not go much lower, and they are hopeful that the worst has been reached. Advices from the East point to a slight improvement in that direction. Old Material, which is largely used by Rolling mills here, is weak, owing to the threatened shutting down of the works on account of the strike with the employees.

Southern Coke, No. 1 Foundry...	\$16.00 @ \$17.00
" " No. 2 " "	15.00 @ 16.00
" " No. 3 " "	14.50 @ 15.00

Cincinnati.

Office of *The Iron Age*, Fourth and Main Sts.,
CINCINNATI, July 2, 1888.

Pig Iron.—There has been a larger inquiry for Pig Iron during the week under review, and the aggregate sales for June are quite large. The tonnage for the month, as a local firm puts it, with Western dealers, is probably the heaviest of any month this year. Large buyers of Pig Iron apparently realize the weight of the arguments advanced in support of higher prices before many weeks, but the average consumer has exhibited no confidence as yet in a recovery of the market. The demand during the past week for round amounts of Pig Mill Iron for late delivery has demonstrated the fact that Southern furnaces are really sold largely ahead, the would-be buyers being unable to make contracts for large amounts for such deliveries as they desired. It production is increasing in the South so is consumption, and the decline in stocks is good evidence that the market is working into a better condition. There is considerable Mill Iron still available for immediate delivery, but the market is well cleared of foundry grades. It is also very difficult to place orders for Car-Wheel Iron either for present or future delivery. Among the sales effected during the week were 4000 tons No. 1 Mill at \$14.25, for delivery during the entire year; 5000 tons Gray Forge at \$13.25, and between 3000 and 4000 tons mixed grades, Mill and Silvery Iron, at \$13.50 75 ton. Moderate sales of No. 2 Foundry have been made at \$15.50; No. 2 75 do., at \$15; 1000 tons Bessemer at equivalent to \$17.70 75 ton here, and about 500 tons Southern Car-Wheel at \$25 75 ton, cash. Prices current here, cash, f.o.b., are approximately as follows:

Hot-Blast Foundry.

Southern Coke, No. 1	\$16.50 @ \$17.00
Southern Coke, No. 2	15.50 @ 16.00
Southern Coke, No. 3	15.00 @ 15.50
Ohio Soft Stone Coal, No. 1	17.00 @ 17.50
Ohio Soft Stone Coal, No. 2	15.00 @ 15.50
Mahoning and Shenango Valley	16.50 @ 17.00
Hanging Rock Charcoal, No. 1	20.50 @ 22.50
Hanging Rock Charcoal, No. 2	19.00 @ 21.00
Tennessee and Alabama Charcoal, No. 1	17.50 @ 18.00
Tennessee and Alabama Charcoal, No. 2	16.50 @ 17.50

Forge.

Strong Neutral Coke	13.50 @ 14.00
Mottled Neutral Coke	12.50 @ 13.00
No. 1 Mill Coke	13.50 @ 14.00
No. 2 Mill Coke	13.00 @ 13.50

Car-Wheel and Malleable Irons.

Southern Car-Wheel	20.00 @ 23.00
Hanging Rock, Cold Blast	22.00 @ 25.00
Lake Superior Car-Wheel and Malleable	21.00 @ 22.00

Manufactured Iron.—The manufacturers and Iron workers have failed to come to an agreement for the ensuing year, and the result will be idleness at the mills for a longer or shorter time. The Amalgamated Association demands a renewal of last year's scale, while manufacturers propose a reduction. The lull at the mills may help the market for the manufactured product, which is still dull and easy, with prices nominal. Bar and Sheet Iron—Common Bar Iron, 1.90¢ @ 2¢; Charcoal Bar Iron, 2.90¢ @ 3¢; Sheet Iron, Boiled, Nos. 10 to 27, 2.50¢ @ 3.25¢; Sheet Iron, Charcoal, Nos. 15 to 25, 3 1/4¢ @ 4 1/4¢ 75 lb.

Nails.—The demand has been only moderate and an easier tone has prevailed, with lower prices ruling. Quotations are based upon 12d @ 40d, which sell at \$2 75 keg, with 10¢ rebate in carload lots at mills; 50d @ 60d, 25¢; 10d, 10¢; 8d @ 9d,

25¢; 6d @ 7d, 40¢; 4d @ 5d, 60¢; 3d, \$1, and 2d \$1.50 per keg more. Steel Nails sell at \$2, and Steel Wire Nails at \$2.65 @ \$2.75 per keg.

Old Material.—The market has been quiet, but steady under moderate offerings and small sales of Old Wheels at \$19 @ \$19.50. Old Rails are wanted at \$20, cash, here.

New York.

Office of *The Iron Age*, 66 and 68 Duane St., New York, July 3, 1888.

American Pig.—Very little business has been done during the past week, and no movement of any consequence is expected in the near future. During the week another striking case has come up illustrating the injury which some sellers of Southern Iron are doing to themselves and principals. A leading foundry up the Hudson River contracted for the delivery of a 1000-ton lot of Southern Foundry Iron some months past. They finally received 250 tons and were unable to get the balance, so that they were finally forced to go into the open market to cover their requirements. The Southern furnaces seem to be willing to book any amount of orders "subject to furnace maker," knowing that they cannot by any possibility fill them all. Such methods are trying to all parties concerned, and are injurious to the best interests of merchants and manufacturers. They should make arrangements to provide against delays in the delivery of Iron. Even now the cotton season is approaching and it looks as though the experience of past years of having large quantities of Iron wanted by consumers lying quietly for months at Savannah will be repeated. We quote for standard and choice Northern Irons, tidewater delivery, \$17.50 @ \$18.50 for No. 1 Foundry, \$16.50 @ \$17.50 for No. 2 Foundry and \$15 @ \$16 for Gray Forge. The strike in the Western mills has little effect upon this market, which is insignificant so far as Mill Pig is concerned.

Scotch Pig.—We quote: Coltness, \$19.50 @ \$20; Summerlee, \$19.50 @ \$19.75; Langloan, \$19 @ \$19.50, and Dalmellington, \$18 @ \$18.25.

Spiegeleisen.—The market is very dull, with reports of offers to sell German Spiegel at \$26 on cars Jersey City, while English is held at \$27 @ \$27.25.

Bar Iron.—As yet no serious effect upon prices has been caused by the lock-out in the Western mills, though their withdrawal from Eastern markets, which they have helped to demoralize, is likely to cause a better feeling. It is believed, however, that the closing down will not extend beyond July. We quote carload lots, on dock, half extras, Common Iron, 1.6¢ @ 1.65¢; Medium, 1.65¢ @ 1.7¢, and Refined, 1.75¢ @ 1.8¢.

Structural Iron.—We quote: Bridge Plates, 1.95¢ @ 2¢; Angles, 2¢ @ 2.2¢; Tees, 2.5¢ @ 2.7¢; Channels and Beams, 3.3¢, on dock.

Plates.—We quote: Tank, 1.9¢ @ 2¢; Shell, 2.15¢ @ 2.30¢; Steel Tank, 2.4¢ @ 2.15¢; Shell, 2.15¢ @ 2.25¢; Flange, 2.6¢ @ 2.75¢, and Fire-Box, 3¢ @ 3.25¢.

Steel Rails.—In the East the market is very quiet, and business has been confined to small lots, and inquiries are confined to a few round lots, up to 5000 to 10,000, for early fall delivery. With Rails selling at \$31 at Chicago, which is equivalent to \$27.75 at Eastern mills, the latter are practically confined to the East and South. In the West more business is reported, one mill having closed 23,000 tons in 70 days, while another is reported as having taken one large contract. Even there, however, little business is in sight. We quote nominally \$30 for moderate lots at Eastern mills.

Wire Rods.—Only a few small sales have been made at \$40 @ \$40.50, which we quote.

Old Rails.—No business of any consequence is reported, and we continue to quote \$20 @ \$20.50 nominally for T's.

Fastenings.—Spikes are \$2 @ \$2.05, and Angle Bars, 1.85¢ @ \$1.9¢ delivered.

Financial.

Business everywhere is quiet but hopeful. A central point of interest just now, that which affords the most reason for apprehension, is the outcome of labor questions among the iron-workers of Pennsylvania and the West. In another quarter much interest is excited by the action of Judge Brewer in granting an order temporarily restraining the promulgation of the reduced railroad tariff in Iowa pending argument for an injunction. The cutting of rates on the trunk lines causes general demoralization east of Chicago.

The Stock Exchange markets remain as for some weeks past, dull and uninteresting, aside from the severe cutting of rates between rival lines of transportation and the prospect of a legal contest in the United States Court to determine the powers of State Railroad Commissioners in fixing tariffs. As has been truly remarked, the situation is peculiar, inasmuch as under the Interstate law the companies cannot form a pool, and differentials having failed, there is no known remedy for the difficulty.

Government bonds are quoted as follows:

U. S. 4½s, 1891, Registered.....	107¼ @ 107¼
U. S. 4½s, 1891, coupon.....	107¼ @ 107¼
U. S. 4s, 1907, registered.....	127¼ @ 127¼
U. S. 4s, 1907, coupon.....	127¼ @ 127¼
U. S. Currency 6s, 1895.....	119 @ 119

A sample of new crop amber wheat from Ohio was shown on the Produce Exchange on Saturday by J. J. Blackman & Co. The quality of the wheat was exceptionally fine, and would weigh 61 to 62 lb to the bushel. The weather during the past week has been favorable for all growing crops in the wheat, corn and tobacco regions of Ohio, the Upper Mississippi and Missouri valleys and Tennessee. The State Board of Agriculture of Illinois state that there has been a decided improvement in the condition of the crops of that State. The condition of winter wheat in the central counties gives encouragement for about an average yield. Winter-wheat harvest is well advanced in the southern counties. The prospect of the corn crop is better.

The official crop report of Colorado shows that alfalfa is the leading crop, being represented by 250,000 acres, while corn has an acreage of 225,000 and oats of 200,000. A dispatch received in this city from London reports India wheat seriously damaged by drought. Speaking of the wheat harvest now in progress the San Francisco papers remark: "The result up to the present has been an agreeable disappointment to those who looked for very short crops."

The weekly bank statement shows comparatively slight changes in specie and legal tenders. The combined loss of these, which constitute the total reserve, is only \$304,700, but the surplus reserve is down, due to an expansion of \$3,278,300 in loans, which is the only striking feature of the exhibit. The banks have increased their loans within a month over \$13,500,000, probably due to preparations to meet July obligations. The banks now hold \$26,817,225 in excess of the 25 % legal requirements, against \$3,651,075 last year and \$11,021,450 in 1886. The Treasury payments for interest and bonds purchased will further augment the bank reserves in the near future. The effect of the preparations incident to the July dis-

bursements has been so slight as to be almost imperceptible. Call loans are still quoted at 1 % @ 2 %, and time loans at 2 % @ 3 ½ %, according to the period for which they run and the kind of collateral offered. A feature of the market was the placing of some \$5,000,000 Canadian funds for six months at 3 % and under. This sum was a part of the proceeds of the loan recently negotiated abroad by the Dominion of Canada, but in excess of immediate requirements. Prime mercantile paper passed as low as 3 ½ %, but the running rates were 4 % @ 5 %. The exports of specie during the week were unimportant, scarcely exceeding \$200,000.

The weekly statement of bond purchases is as follows: Amount purchased of 4 per cents, \$18,383,800; amount purchased of 4 ½ per cents, \$8,393,050; total, \$26,776,850; cost of 4 per cents, \$23,347,744.20; cost of 4 ½ per cents, \$9,089,056.20; total, \$32,386,800.40; cost at maturity, 4 per cents, \$32,539,326; cost at maturity, 4 ½ per cents, \$9,705,158.31; total, \$42,244,584.31; saving on 4 per cents, \$9,191,581.80; saving on 4 ½ per cents, \$666,102.11; total, \$9,857,683.91. The Commissioner of Internal Revenue estimates the total receipts from internal taxes during the fiscal year just closed to be \$124,500,000. This is an increase of nearly six millions over the receipts of last year and an increase of \$4,500,000 over the Commissioner's estimate at the beginning of the year. The receipts from Customs will probably not exceed greatly the receipts of last year. For the entire fiscal year ended June 30, 1887, they were \$217,286,898. The estimated reduction in the public debt for the month of June is \$14,429,502, and for the year \$113,900,000, against \$109,707,646 for the fiscal year ended June 30, 1887.

The imports of merchandise at this port during the week were valued at \$9,000,000, of which \$2,000,000 represents dry goods. Since January 1 the total is \$240,157,000, as compared with \$236,015,000 during the same time last year. The exports were \$4,726,647.

There were 182 more mercantile failures in the United States during the last six months than there were during the first half of last year, and the increase in the liabilities of those who failed in the first quarter of the present year was about \$5,000,000. *Bradstreet's*, which supplies these figures, attributes the increase mainly to cotton speculation, a bank failure and "dry rot" in several old business houses. For the second quarter the increase of liabilities is about \$6,000,000, attributed largely to the failure of the American Exchange in Europe, of a large dry goods house, a whisky house and a tea firm. Assets, however, amounted to 53 % of liabilities, as against 48 % one year ago.

The assessed valuation of real estate in New York City for 1888 is \$1,302,818,879; increase over last year, \$48,327,080, equal to 3.85 %.

There was a decrease yesterday of 5¢ in the East-bound rate on agricultural implements from Chicago.

The foreign exchange market is again firmer, and on Monday the rate was advanced ½ to \$4.87 ½ @ \$4.89.

In coffee and cotton there has been unusual speculative interest, Rio advancing in a single day 9¢ per pound, the widest fluctuation known in the history of the Exchange, and dealings in cotton were larger than for a long time past, though at a lower range, cash cotton declining ¼¢ @ ½ lb. Raw sugars were strong, with an active demand from refineries. No small degree of interest attaches to the decision of the Attorney-General of this State to inquire judicially into the combination commonly known as the Sugar Trust, and it is surmised that proceedings will commence without delay. Nothing further

has transpired concerning the threatened boycott of non-union refineries in Philadelphia. In wheat there is a firmer feeling, in consequence of a better export demand. Corn and oats advanced slightly in sympathy with wheat. Provisions are dull and easy. The dullness long observed in manufactures of wool begins to be felt in cotton goods. For most descriptions of staple groceries quotations are firm. Prices of anthracite coal are well maintained under a restricted production.

The city of Providence, R. I., has established a bank clearing house. There are 34 banks that have associated themselves with the new organization and two trust companies.

Metal Market.

Copper.—Chili Bars opened in London on Thursday of last week at £81. 2/6, spot, and improved 2/6, but the advance was lost subsequently, and they again came £81. 5/ yesterday, while futures maintained the 5/ gained, coming £78. 10/ yesterday. The total sales did not exceed 225 tons. In our own market Copper was devoid of anything doing to speak of, spot and July ranging between 16½¢ and 16.60¢, nominally; August at 16.45¢, September and October at 16.40¢ @ 16.45¢, down to 15.90¢ bid. In the London market spot Chili Bars remain steady to-day at £81. 5/, while futures have given way 10/, being cabled £78. Our own market is absolutely stagnant to-day at nominally 16.50¢ @ 16.60¢ spot Lake. It was cabled from London since our last report that the French syndicate has made a contract with two of the leading Copper mines in Japan, representing seven-eighths of the total output of that country, for their product during three years. On the Paris Stock Exchange Rio Tinto shares declined last week 8½ francs.

Tin.—Spot Tin opened last Thursday in London at £75. 2/6, and futures at £75. 10/, but the former the next day improved to £75. 5/, the latter remaining steady, sales amounting to 160 tons, while here the dull state of affairs continued, spot being offered at 17.05¢, while 16.80¢ was bid, June at 17½¢, with 16½¢ bid; July and August at 17.05¢, with 16.95¢ bid, and 70 tons, August, sold at the latter figure, after 45 tons had been done at 16.85¢ on Thursday. This week opened in London under more favorable auspices, 220 tons being sold yesterday, and the quotation for spot coming 7/6 higher, at £75. 12/6, while futures improved 15/, to £76. 5/. The improvement on the other side was responded to in our own market by an advance, 145 tons being sold at 17.25¢ @ 17.55¢ for August, 17.25¢ for July, and 17.45¢ @ 17.50¢ for October. London this morning opens at a further improvement of 5/, futures as well as spot, the latter being worth £75. 17/6 and the former £76. 10/. The cause of the buoyancy has to be searched for in the favorable statistics disclosed by the figuring up on the 1st inst. The deliveries in London and Holland reached last month no less than 4268 tons, against 1999 in June, 1887, and 1835 in June, 1886, reducing the visible supply in Europe and America, July 1, to 20,403 tons, as compared with 16,092 tons same time last year, and 10,871 on July 1, 1886. **Tin Plates.**—Stocks continue light, which helps to sustain the price for spot lots. Considerable concessions can be had for future delivery. The demand is only moderate for the latter, as well as for spot Plates. We quote at the close, large lines, on the spot: Siemens-Martin Steel, Charcoal finish, \$5 @ \$5.25; ditto Coke finish, \$4.80; Ternese, \$4.30 @ \$4.40; Bessemer Cokes, \$4.50 @ \$4.60, and Wasters, \$4.35 @ \$4.40. Coke Tins are selling at 12/9 in Liverpool, for prompt delivery.

Lead.—Consumers took during the week under review 300 tons of Common Domestic Lead in the open market at 3.80¢ @ 3.85¢, but the price to-day is 3.90¢. They all complain of a dull trade and serious falling off in the demand. Meanwhile London has been improving, and Soft Spanish is cabled £12. 10/, which is a 2/6 advance since our last. But even at this advance it can be laid down in New York in bond at 2½¢. Lead sales at the Metal Exchange embraced on Thursday last 178 tons at 3.80¢ @ 3.82½¢, spot, 3.87½¢ @ 3.95¢, July and 4.05¢, August; on Friday 400 tons at 3.95¢ @ 3.97½¢, July, 4¢ @ 4.05¢, August, and 4.05¢ September; yesterday 500 tons brought 4¢ @ 4.02½¢ on the spot, 3.95¢ @ 3.97½¢ for July, 3.90¢ @ 3.95¢ for August, and 4.02½¢ @ 4.05¢ for September.

Spelter and Zinc.—Common Domestic Spelter does not bring over 4½¢, ordinary brands, just at present, the demand for the week having been insignificant, while Silesian may be quoted 5¢ @ 5½¢. The course of the market here would improve if the lockout in the Iron regions were avoided, as a good demand for Galvanizing might then possibly set in. While this question remains in abeyance not much of a revival need be looked for. In Europe a further improvement in Lead might start an upward movement in Spelter again, as the two metals usually go together on the Continent.

Antimony.—Nothing of interest has occurred. The demand is moderate, but steady, at 13½¢ @ 13½¢ Cookson, and 10½¢ @ 10½¢ Hallett.

New York Metal Exchange.

The following sales are reported:

THURSDAY, June 28.	
16 tons Lead, spot	3.80¢
16 tons Lead, spot	3.82½¢
16 tons Lead, July	3.87½¢
16 tons Lead, July	3.92½¢
16 tons Lead, July	3.95¢
46 tons Tin, August	16.85¢
50 tons Lead, August	4.15¢
48 tons Lead, July	3.92½¢
16 tons Lead, July	3.92½¢
FRIDAY, June 29.	
25,000 lb Copper, October	16.40¢
96 tons Lead, July	3.87½¢
50 tons Lead, August	4.05¢
16 tons Lead, July	3.97½¢
16 tons Lead, July	3.95¢
16 tons Lead, August	4.02½¢
16 tons Lead, August	4.00¢
16 tons Lead, August	4.02½¢
100 tons Lead, August	4.02½¢
34 tons Lead, August	4.00¢
50 tons Lead, September	4.05¢
100 tons Lead, August	4.00¢
MONDAY, July 2.	
10 tons Tin, August	17.35¢
10 tons Tin, August	17.30¢
50 tons Tin, October	17.50¢
10 tons Tin, October	17.45¢
250 tons Lead, August	3.95¢
16 tons Lead, August	3.92½¢
16 tons Lead, August	3.90¢
(Sellers right to double.)	
16 tons Lead, August	3.90¢
(Sellers right to double.)	
16 tons Lead, September	4.05¢
100 tons Lead, September	4.02½¢
88 tons Lead, September	4.00¢
10 tons Tin, August	17.80¢
30 tons Tin, July	17.25¢
16 tons Lead, spot	4.00¢
16 tons Lead, spot	4.02½¢
16 tons Lead, July	3.97½¢
16 tons Lead, July	3.95¢
16 tons Lead, July	3.97½¢
25 tons Tin, August	17.35¢
TUESDAY, July 3	
82,500 lb Lead, September: (sellers' right to double)	4.07½¢

Coal Market.

The Anthracite Coal trade is reported to be in excellent condition, free from labor troubles, and with prices well maintained. The Coal sent to market during the year, to date, is 15,695,759 tons, against 15,238,579 tons for the same period last year. Quotations are as follows: Wyoming Free Burning, f.o.b. at South Amboy and Weehawken, Broken or Grate, \$3.75; Egg, \$4; Stove and Chestnut, \$4.25; Reading

Hard White Ash, at Port Elizabeth, Lump and Steamboat, \$4.25; Broken, \$4; Egg, \$4.10; Stove, \$4.25; Chestnut, \$4.15; Pea, \$3. Free burning White Ash is the same, except Broken, \$3.75, and Egg, \$4. Lehigh Coals are: For Lump, \$4.50 Broken, \$4.20; Egg, Stove and Chestnut, \$4.10 ½ ton, f.o.b. at the loading ports.

A tacit understanding exists all round that about July 15 prices of Anthracite will be advanced 15¢ @ 25¢ ½ ton, or an average of about 20¢. In the absence of any formal announcement to this effect the proposed advance is referred to as bearing the stamp of authority.

The Bituminous trade is dull and sales are heard of as low as \$2.90 alongside. Comparatively little is doing excepting in deliveries on old agreements.

Imports.

The imports of Iron and Steel, Hardware, &c., at this port from June 18 to June 28, inclusive, and from January 1 to June 28, inclusive, were as follows:

Iron and Steel.

	June 18 to June 28.	Jan. 1 to June 28.

British Iron and Metal Markets.

[Special Cable Dispatch to The Iron Age.]

LONDON, TUESDAY, July 3, 1888.

There is still a more or less unsettled feeling in the markets for Block Tin and Copper. The syndicate doings are carefully hidden and outside speculative holders do not appear to be very enthusiastic. It is the belief that a large portion of the syndicate Tin is still unsold and the impression obtains that that interest would be the first to meet any improvement in the demand. However, the fact that the Chinese dealers in the Straits have stored metal in considerable quantities at primary points instead of selling at late current prices leads to a belief that support may be looked for in that quarter. Trading has been more active the past two days and purchases for cornering of "short" sales gave prices a turn for the better. There is a large quantity of high-priced Copper held in this market by outside speculators, and, in view of the fact that no opportunity has been afforded for satisfactory reselling, it is thought that forced realizations will soon be in order. The business in Refined Copper, Sheets, &c., is still very much restricted, and an undercurrent of weakness is apparent that contrasts with the seeming firmness of Chili Bars. The Associated Smelters have lowered their price for Best Selected to £78, but outside lots are £1. 6/ @ £2 below that and difficult to sell. Sheets have also been reduced, and the nominal prices are now £6 below those current last month. There is some uncertainty as to whether the reductions made were wholly on the manufacturers' own responsibility or agreed to by the syndicate. In either event revision has no favorable bearing upon the market for Chili Bars. The visible supply in Europe is stated at 72,000 tons, against 52,000 tons a year ago, but the amount of Copper "in sight" does not cover the entire stock. The syndicate hold no less than 65,000 tons foreign, besides about 20,000 tons English. It is stated that a considerable quantity of outside Copper and Furnace Material has been purchased recently for syndicate account, and that interest is thought to have more complete control now than heretofore. Regarding contracts made by the syndicate for Japanese Copper, reference to which was made in a previous report, the following particulars are given: The contracts call for 9000 tons out of the annual production of about 10,500 tons, and run one year, with the option of being renewed, for similar quantity, for a series of years ahead.

The Tin Plate Market has undergone very little change, and that little is certainly not for the better. As a matter of fact the demand has dropped off considerably, while some makers have named very low prices as a means of drawing in orders for future delivery. This weakness is partially due to increased production, as well as moderate demand. Richard Thomas, London, has purchased the Melin-Griffiths plate works for £12,000.

The Clyde shipbuilders have secured large contracts recently, and this together with a good demand for railway supplies has caused quite a brisk demand for Steel of nearly all descriptions. The sale is reported of a cargo of Blooms for shipment to Boston from the Tees, the first American transaction in a long time. The Ebbw Vale Company have secured an order for 11,000 tons Steel Rails for a Portuguese railway. The price is not stated. Their Staffordshire ironworks are being put in readiness for restarting.

Beyond some hardening of prices of Hematite, due probably to the renewed activity in the Steel trade, there has been no material change in the Pig Iron mar-

kets. Middlesboro' Pig barely holds its own, and Scotch staggers under the weight of heavy surplus stocks, the amount in Connal's stores being now 1,000,000 tons. There has been a little "spurt" in warrants, due to covering by speculators.

A meeting of the creditors of Stevenson Jaques, Middlesboro', has been held, at which a report was submitted showing liability £42,000, and assets £13,000.

There has been a "strike" at the West Cumberland Steel Works, and the workmen are all out.

Scotch Pig.—A fair volume of business and prices steady for most brands.

No.	Coitness, f.o.b.	Glasgow.	
No. 1 Summerlee	"	"	46/6
No. 1 Gartsherrie	"	"	44/6
No. 1 Langloan	"	"	44/8
No. 1 Carnbroe	"	"	39/
No. 1 Shotts	"	at Leith	45/
No. 1 Glasgow	"	Ardrossan	43/
No. 1 Dalmeilington	"	"	39/6
No. 1 Eglinton	"	"	38/

Steamer freights, Glasgow to New York, 5/; Liverpool to New York, 7/6.

Cleveland Pig.—Prices firmly held, but business moderate. No. 1 Middlesboro', G.M.B., 34/; No. 3 do., 31/8.

Bessemer Pig.—The market very steady, with a good business passing. West Coast brands, mixed numbers, 42/8, f.o.b. shipping point.

Spiegeleisen.—Demand continues good, and prices are very firm. English 20 % quoted 80/, f.o.b. N. W. England shipping point.

Steel Rails.—The market steady, and demand fairly active. Standard sections quoted at £3. 17/, f.o.b. at N. W. England shipping point. Middlesboro' district about 2/6 @ 5/ less.

Steel Blooms.—Rather quieter, but steady. We quote at £3. 13/8 for 7 x 7, f.o.b. at N. W. England shipping point.

Steel Billets.—A good business at slightly lower prices. Bessemer, 2 1/2 x 2 1/2 inch, £3. 17/6, f.o.b. at N. W. England shipping point.

Steel Slabs.—Demand moderate. Prices barely steady. Bessemer, £3. 18/6, f.o.b. at N. W. England shipping point.

Steel Wire Rods.—Quiet market and prices easier. Mild Steel No. 6 quoted at £5. 16/3 and No. 5 at £5. 12/8, f.o.b. at N. W. England shipping point.

Old Rails.—Demand still light and prices weaker. Tees quoted at £2. 15/ @ £2. 17/6, and Double Heads £2. 17/6 @ £3, c.i.f., New York.

Scrap Iron.—Market dull and rather weak. Heavy Wrought at £2. 5/ @ £2. 7/6, f.o.b.

Crop Ends.—Demand slow and prices nominal. Bessemer quoted £2. 5/ @ £2. 7/6, f.o.b.

Tin Plate.—Only a moderate trade and prices barely steady. We quote, f.o.b. Liverpool:

IC Charcoal, Allaway grade	14/9 @ 15/
IC Bessemer steel, Coke finish	12/9 @ 13/
IC Siemens	13/8 @ 13/6
IC Coke, B. V. grade	12/9 @ 13/
Charcoal, Terne, Dean grade	12/6 @ 12/9

Manufactured Iron.—A firmer tone to the market, but business not brisk. We quote, f.o.b. Liverpool:

Staff. Ord. Marked Bars	£ 4 17/6 @ 5 0/0
Common	£ 4 17/6 @ 5 0/0
Bl's Sheet, singles	£ 6 10/0 @ 6 10/0
Welsh Bars (f.o.b. Wales)	£ 4 12/6 @ 4 15/0

Tin.—Irregular market, more active trading. Straits quoted at £76 @ £78. 5/ spot, and £76. 5/ @ £78. 10/ for three months' futures.

Copper.—Trading moderate; market barely steady. Chili Bars closed at £81. 2/6 @ £81. 5/, spot, and £78, three months' futures. Best Selected, £79, nominal.

Lead.—More doing and the market firmer. Soft Spanish, £12. 7/6 @ £12. 10/ at the close.

Spelter.—Quiet market and prices still in buyers' favor. Silesian, ordinary, £14. 15/ @ £15 at the close.

Hardware.

The month opens with a moderate demand, and a market in which prices are, as a rule, unchanged. Some quotations are, however, being revised, and lower prices in special lines are ruling, but the prices of goods generally continue as before.

Nails.

The New York market continues very quiet, as is natural during the present season. A number of mills throughout Eastern Pennsylvania have closed down during the hot weather. We quote carload lots on dock \$1.90 to \$1.95, and smaller lots from store \$1.95 to \$2.

R. H. Johnson, who is connected as secretary with the Wire Nail, Wire, Iron Rope and Bessemer Steel Association, has issued a circular containing proposals looking toward putting the Cut-Nail trade on a sounder basis. His plan is to allot percentages to the mills monthly, on the basis of estimated consumption, the mills not knowing until the end of the month what their allotment has been, the whole quantity being based upon the number of machines. If a mill exceeds its allotment it pays a fixed sum into the treasury, from which those draw allowances who have not made as much as their allotment. It is stated that all of the Wheeling mills have signed and that all but two of the leading works west of the Allegheny Mountains have agreed to the scheme. A commissioner located at Chicago is to take charge of the allotment of production, the mills managing their own affairs in other respects. Mr. Johnson has already made approaches to some of the leading Eastern interests. Whether or not the scheme can be carried through remains to be seen. Past efforts in this direction have been anything but encouraging.

Wire Nails.

The market is without material change, prices being irregular and low, \$2.50 being named as the carload price at factory, and small lots from store selling at \$2.60 to \$2.70.

With reference to the condition of the Wire Nail market we have the following from a well-known manufacturer:

It is perhaps too old a story to say to you that Wire Nails are selling very much less than cost, and we yet find an unfeeling public slow to believe that this is true. The fact, however, remains that prices are such that they must be speedily disastrous to a large amount of capital and to a great many people who have ventured into this industry. In spite of this state of things, however, your paper often gives glowing accounts of a new concern started in some community where people have not yet had their fingers burned. Confiding stockholders are going to learn something in the next two or three years.

Barb Wire.

The market is sluggish with a small demand. Prices are to a large extent nominal, being quoted at 4 cents for carload lots and 4.30 cents for small lots from store. It is probable that these prices could be slightly shaded.

Ammunition.

The Ammunition market to a casual observer continues in about the condition it has been for several weeks, there being no obvious change in the situation. The offering of Cartridges by the E. C. Meacham Arms Company, at cut prices still continues, and they are unquestionably supplying a good many goods, and to a considerable extent annoying their competitors and the manufacturers, and thus demoralizing the market. Most of their sales are to the small trade at but a slight concession from regular prices, their policy apparently being to sell Ammunition in St. Louis at New

York prices, a thing which, by the rules of the association, their competitors, who are loyal to the association, are not permitted to do. At the same time the Meacham Company are making some sales at lower prices to the larger trade, but a desire to keep their stock from becoming exhausted makes them exceedingly cautious in so disposing of their goods, especially in view of the policy of the association, to which we have before referred, of having the goods purchased in their interest for the purpose of exhausting the supply.

While the Meacham Company are thus shrewdly and persistently carrying on their part in the contest it must be borne in mind that the association are doing all that they can to keep the market regular, and to prevent the Meacham Company from obtaining goods. As there is reason to believe that the company's stock is being replenished from time to time, the association are using due diligence to ascertain the sources of supply, and to prevent the furnishing of the goods. With a view to accomplishing this they have been adopting measures to induce the Special and the A houses to adhere closely to the letter and spirit of their contracts, so as to prevent irregularities as far as possible. The requirement of a monthly affidavit exceedingly sweeping in its scope went into effect last January, but, not satisfied with this, it is reported that efforts have been made in some cases to obtain additional affidavits. This policy has not, however, in all cases resulted as desired, having been met by a refusal to give other affidavits than those called for in the terms of the contract. It is also generally understood that special pains have been taken to get information in regard to the sales made by houses between whom and the Meacham Company it was thought that there might have been some kind of an understanding, and it is intimated, apparently on good ground, that "spotters" or detectives have been employed with more or less freedom to ascertain the source or destination of goods.

The result of this action has probably been to a certain degree successful, as the association have made it somewhat more difficult than it has heretofore been for the trade to purchase Ammunition at irregular prices. For some time, as our readers are aware, there had been in a very quiet and confidential way a great deal of irregularity in the prices at which Cartridges have been sold, many of the trade who purchased in considerable quantities being able to get in an indirect way concessions from the regular price. To such an extent has this irregularity been carried that it has been estimated by a well-informed party in this line that a comparatively insignificant portion of the Cartridges consumed were free from irregularity in price somewhere between the factory and the counter. While it is probable that the manufacturers have succeeded in slightly checking this tendency, our advice are to the effect that the irregularity continues without substantial abatement, and that buyers can still in many cases obtain concessions, as the association are apparently finding much difficulty in regaining or holding their control of prices.

While their effort in this direction may have been attended by a measure of success, it is undoubtedly the case that the trade while inclined to acquiesce in a system which would give them a handsome profit in handling goods are disposed to be restless under the restrictions which the association places upon them, and it is thought not unlikely, if the manufacturers continue drawing the cords more tightly, that the large trade will become restive, and protest against what they regard as arbitrary dictation. The requirement of the affidavit in regard to Cartridge

sales is regarded as especially obnoxious. The disfavor with which pools and combinations are held by the trade, and the satisfaction taken by many merchants in circumventing them, is also an unobserved but potent factor in the situation.

While there are rumors in regard to the formation of a new Cartridge company in which the Meacham Company will be interested, the question of the ability of the latter to obtain goods during the next few months is one of especial importance. The general opinion is that they will be able in one way or another to obtain such Cartridges as they may require for sale to the small trade at the slightly cut prices which it is their policy to make, and that they will thus continue to cause more or less irregularity in the market. In the meantime trade is exceedingly quiet, there being a widespread feeling that there may be a reduction in prices. In these circumstances it is maintained by many that it would be the part of wisdom for the association to make some terms with the Meacham Company if this were found to be feasible. Of their willingness to do this, however, the association give no intimation, and, if they should do it, it would be regarded by the trade as an evidence of weakness. It remains to be seen what further action they will take with a view to improving a situation unsatisfactory both to them and to the trade at large.

Miscellaneous Prices.

The following is the price list of the Champion Safety Lock and Novelty Company, Cleveland, Ohio, to whose Side Window and Meeting-Rail Window Sash Locks we have before alluded. The list prices are subject to a discount of 60 per cent.:

The Champion Safety Side Window Sash Locks and Fasteners Combined.

No.	Per doz.
10, Malleable Iron, Bronzed.....	\$1.20
12, Malleable Iron, Polished Face, Bronzed, 1.40	
15, Malleable Iron, Bronzed, Nickel-plated face.....	1.80
18, Malleable Iron, Plain, Bronze-plated..	1.75
20, Bronze Metal, Plain.....	3.50
25, Bronze Metal, No. 4 Finish.....	3.50
28, Bronze Metal, Nickel-plated.....	3.60

The Champion Safety Meeting-Rail Window Sash Locks.

No.	Per doz.
103, Iron, Bronzed.....	\$1.25
105, Iron, Bronzed, with Bronze Metal Lever.....	2.00
107, Iron, No 1 Finish.....	2.25
109, Iron, Polished and Bronze-plated....	2.25
110, Iron, Plain, Polished and Bronze-plated.....	4.50
111, Real Bronze Metal, No. 1 Finish.....	7.00
113, Real Bronze Metal, No. 3 Finish.....	7.00
115, Real Bronze Metal, Plain Finish.....	7.50
117, Real Bronze Metal, Nickel-plated....	9.00
119, Real Bronze Metal, Plain Finish, Large Size.....	17.00

The following prices on Clothes Wringers, Mangles, &c., are announced by the Lovell Mfg. Company, Erie, Pa. The following is their Clothes Wringer list, which is subject to a discount of \$2.50 per dozen; terms f.o.b. Erie, net 60 days, 2 per cent. discount for cash in 10 days:

Clothes Wringers.

No.	Per doz.
XX, Invincible, with Rowell gears.....	\$36.00
No. 11, Princess Bench Wringer, with Rowell gears.....	39.00
No. 10, New Princess, with Rowell gears.....	27.00
No. 2½, Princess, with Rowell gears.....	27.00
No. 1½, Princess, without gears.....	25.50
No. 2, Phoenix, with cogs.....	27.00
No. 1, Phoenix, without cogs.....	25.50
No. 2, Old Reliable.....	22.50
No. 3, Old Reliable.....	27.00

Their Clothes Mangles, Folding Wash Benches, &c., are sold as follows, terms f.o.b., net 60 days, 2 per cent discount for cash in 10 days:

Clothes Mangles.

	Per doz.
Economist Mangle.....	\$60.00
Terms, f.o.b. Erie; net 60 days; 2 per cent. off 10 days.	

Folding Wash Bench.

	Per doz.
Folding Wash Bench.....	\$12.00
Folding Wash Bench, with Wringer stand.....	15.00

The Stanley Rule and Level Company make no changes in their prices or discounts on July 1. They have added one quite novel tool to their line of specialties, a description of which will be found in our columns, page . This tool has been christened *Odd Jobs*, as indicating by the name its many uses. The manufacturer's price is 75 cents each, with a discount to dealers of 20 and 10 per cent.

A slight advance has been made by the associated manufacturers in the price of Wringers. Instead of the abatement from list of January 10 of \$3, as heretofore, it is now \$2.50; terms, f.o.b., 60 days, with 2 per cent. discount for cash in 10 days.

Door Locks do not show any evidence of improvement, but are apparently in a worse condition than for some time. Net prices representing exceptionally low quotations are more frequently made and a disposition is shown by the manufacturers to induce sales by offering low prices.

Padlocks are somewhat weaker in price, quotations made during the last season being now slightly shaded.

Since our last report the market for Wrought-Iron Pipe has shown no further settling, the low prices then referred to still continuing. At present quotations it is thought by well-informed parties that Pipe would be a safe purchase, as it is not likely to go much lower and will probably in the near future be held at somewhat higher figures.

At the meeting of the manufacturers of Squares held last week it was found impracticable to continue the control of prices, and the market is now an open one. As a consequence materially lower quotations than have prevailed for some time are now made, and this line of goods is regarded as somewhat demoralized.

Bright Wire Goods are also in an unsettled condition and lower quotations are made. The competition in this line is animated, and it is intimated that it is not probable that there will be a material improvement immediately.

A reduction has been made in the prices of Cast Butts, which are now quoted at discount 70 and 10, with only a small extra to the large buyers. The destruction of the works of the Reading Hardware Company, referred to in another column, may have some effect in strengthening the market, as the production of goods is thus for a time materially diminished.

The new prices for Carriage Bolts have gone into effect and the action of the manufacturers is generally regarded with satisfaction. The regularity that is thus promised in this line, with the reasonable prices established, apparently meets the approval of the trade.

The Philadelphia Pattern Carriage Bolt market is reported to be unsettled and weak, and some low quotations have been made. It remains to be seen whether or no it will be feasible to correct this condition of things.

Machine Bolts and Bolt Ends are also offered at slightly lower prices with only a moderate demand.

Items.

The Atha Tool Company, of Newark, N. J., for whom C. H. Gurney & Co., of Chicago, are general Western agents, have issued a new illustrated catalogue and price list of the steel tools which they manufacture, embracing Adzes, Axes, Chisels, Hammers, &c. It is a book of 146 pages, bound in cloth, with heavy

boards and beveled edges and is a most excellent specimen of fine printing and engraving. The peculiar trade-mark of the company occupies a conspicuous position. It consists of a capital A inclosed in a horseshoe, on which the name of the company curves round the toe. The official Steel classification is printed in full on the closing pages of the catalogue.

The catalogue and price list of J. H. Sternbergh & Son, the Reading Bolt and Nut Works, Reading, Pa., is elegantly printed in red and black on paper of exceptionally fine quality. It represents the varied line of goods which they are manufacturing, with list prices revised to date. They also call attention to their machinery for Bolt and Nut manufacturers and state that they are prepared to manufacture Bolt heading, pointing and threading machines, shears for cutting blanks, Hot-Pressed Nut machines and Nut-tapping machines, of which they make several sizes of each, adapted to all classes of work.

We regret to have to announce the destruction of the work of the Reading Hardware Company, Reading, Pa., by a fire which occurred last evening. The fire originated in the polishing department which occupied a central position in the extensive plant, whence it spread rapidly to other buildings, so that in a short time the entire works, with the exception of one foundry, were completely destroyed. The parts burned included the pattern shops, the warehouses, the polishing and nickel-plating departments, packing department, the engine and boiler houses, the japanning and finishing departments and the offices. These buildings contained a great quantity of valuable machinery, patterns, materials and finished goods and the loss is estimated at from \$250,000 to \$350,000.

In the list of the associated manufacturers of Carriage Bolts which was given in our last issue the address of the Anderson Bolt Company was erroneously given as Indianapolis, Ind. It should have been the Anderson Bolt Works, Anderson, Ind. Their card emphasizes the fact that they use natural gas, and refers to Common Carriage Bolts, Machine Bolts, Lag Screws, Bolt Ends, Bridge Bolts and Hot-Pressed Nuts as manufactured by them.

A recent transfer of property and change of business in which the Buffalo Wire Drawing Company are concerned has been given publicity in the daily press of that city. We are desired to state that the Buffalo Wire Works, Scheeler & Sons, are not connected with the above company, as might possibly be inferred from the similarity of names.

J. H. Sternbergh & Son, Reading, Pa., are sending out nickel-plated Hexagon Nuts which are intended for use as paper weights. While they serve this purpose admirably they are also utilized in calling attention to their manufactures of Bolts, Nuts, Rivets, Washers, Iron, &c.

Elsbre & Mix, Sherburne, N. Y.; have transferred their stock and business to a new firm, Conley & Ingham, who will carry it on at the old stand.

The Keokuk Novelty Company, Keokuk, Iowa, C. H. C. Burlingame, president, issue a circular describing their Sure Shut Spring Hinge, the advantages of which are pointed out.

Porter & Wooster, 66 and 68 Beverly street, Boston, Mass., so long and favorably known throughout the country as manufacturers of Carriage Hardware Specialties, dissolved partnership July 1. Both partners will continue business at their present location, Mr. Porter manufacturing the Easy Bolt Clipper, and Mr. Wooster manufacturing the other goods

heretofore made by the firm, with the exception of Body Corner Irons. This branch of their business has been sold to C. Cowles & Co., New Haven, Conn. The firm is referred to as having been successful, and in this new departure the partners are regarded as having excellent prospects.

The Pennsylvania Bolt and Nut Company, Lebanon, Pa., for whom Topping & Fox, 96 Chambers street, New York, are agents, have issued an illustrated catalogue and price list in which they exhibit the line of Bolts, Bolt Ends, Lag Screws, Nuts, Washers, Turn Buckles, Forgings, Boiler and Bridge Rivets, &c., of which they are manufacturers. A full-page illustration is given of the extensive works of the company.

We are advised by Quernheim & Heckell St. Louis, Mo., that they are general agents for the Moser Bundle and Package Carrier, manufactured by the Moser Holder Company, Belleville, Ill., and that they are prepared to negotiate with responsible parties for the exclusive sale of these goods in their respective cities. Hibbard, Spencer, Bartlett & Co., Chicago, Ill., are referred to as having the exclusive sale of these goods for that city.

Hartley & Graham, 17 and 19 Maiden Lane, New York, announce that they are prepared to furnish the trade with improved quality Shot Shells of the Union Metallic Cartridge Company, packed in new boxes with fancy lithographed labels, samples of which are at the same time sent out. These new labels are attractively printed with appropriate illustrations.

The Francis Axe Company, Buffalo, N. Y., in their advertisement, occupying page 62, call attention to the All Steel Axes, illustrating also some specialties. The trade will observe that it is intimated that special rates will be made for immediate orders to be shipped by September 1.

Nimick & Brittan Mfg. Co., Pittsburgh, Pa., send out a circular of the House Automatic Liquid Door Check and Spring, which they are now manufacturing. Illustrations are given explaining this article and pointing out its utility. The House Liquid Door Check and Buffer is also shown.

W. B. Belknap & Co., Louisville, Ky., under date July 2, issue in a four-page circular the new cards for Cut and Wire Nails, with a table giving the length and thickness of the latter. In the circular to the trade these Nails are referred to as having been often characterized as the Nail of the past and the Nail of the future respectively, but are stated to be to them the Nail of the present, as large stocks of both are carried.

Recknagel & Co., 106 Broad street, New York, send out a circular relating to the Cataract Washing Machine, for which they are agents. It gives a description of the machine, pointing out its special features. That the interior of the machine is free from bolts, screws, nuts, rivets or anything liable to tear the clothes is emphasized. This machine has been offered to a limited extent and this house is now preparing to put it on the market more generally.

The Philadelphia Milk Shaker Mfg. Company, corner Thirteenth and Buttonwood streets, Philadelphia, Pa., issue a circular describing the Milk Shaker which they are manufacturing, and also an Ice Shaver.

The E. S. Greeley Company, 5 and 7 Dey street, New York, issue a circular relating to Tamer's Patent Telephone Attachment, which is for the purpose of increasing the distinctness with which a Telephone is heard, preventing the rattling of the trans-

mitter diaphragm, &c. They also issue a leaflet in which the Electricians' Pocket Tool is illustrated. This article comprises a Birmingham Wire Gauge, the French millimeter and English inch comparative Scales, Screw Driver, Wire Cleaner, Pencil Sharpener and a Wrench.

The Union Indurated Fibre Company, 37 Barclay street, New York, are sending out a circular relating to Paper Bags, which they are offering at low figures. These Bags are made by the well-known firm of L. Waterbury & Co., and have on them an advertisement of Indurated Fiber Ware, in which the advantage of this Ware over ordinary Woodenware is pointed out. These Bags are furnished at the following prices with the company's advertisement on:

2 pound standard.....	\$1.25 per 1000
4 pound standard.....	1.80 per 1000
2 pound special.....	1.00 per 1000
4 pound special.....	1.45 per 1000

They will add a merchant's card not exceeding three lines at slight additional cost.

Convenient Store Fixtures.

In our issue of several weeks since we briefly called the attention of our readers to some of the methods employed by Mr.

Convenient Store Fixtures.—Fig. 243 —Oil Cloth Rack.

Charles W. Davis, of Wabash, Ind., in the arrangement of his stock of shelf hardware, &c., and referred among other things to various devices used in the display of his goods. Supplementing what

Fig. 244.—Gas-Pipe Rack for Cages.

then appeared, we present by means of the accompanying illustrations several views of the devices referred to. In Fig. 243 we show a rack adapted for the display of floor oilcloth, which is of a sufficient width to receive one roll of eight-quarter

or two rolls of four-quarter cloth. The rack is described as being set in the shelving, and is 6 feet 6 inches wide, 12 feet high and 12 inches deep, made of 2-inch poplar. It is provided with a series of rolls, octagonal in shape, placed 10 inches

Fig. 245.—Rack for Wire Screen Cloth.

apart, or a sufficient distance to allow of a full roll of oilcloth or linoleum. The rolls are $2\frac{1}{2} \times 2\frac{1}{2}$ inches. Mr. Davis informs us that this rack may be placed on the wall at the end of the shelving or be built in the shelving, as may be preferred, and extended upward to the ceiling. The general arrangement of the rack, with several rolls of oilcloth in position, is shown in Fig. 243. In Fig. 244 is shown a bird cage rack made of gas-pipe. It is composed, as will be seen from an inspection of the engraving, of two rings, the upper one being 4 feet in diameter, while the lower

Fig. 246.—Rack Showing Method of Handling Rope.

one has a diameter of 6 feet. The two rings are connected by means of gas-pipe, which renders the rack firm and durable. It is suspended by means of a chain which runs over double pulleys to the side of the room and then down within convenient distance from the floor. This enables the cage to be readily lowered for the purpose of examining the goods suspended from it. It has a capacity for 30 cages. In Fig. 245 of the illustrations is shown a perspective view of the rack employed by Mr. Davis for holding wire-screen cloth. As will be noticed, the standards supporting the lower section are fastened to the sides of the counter in such a way that the cloth may be easily unrolled and measured upon the counter. The rolls upon

which the wire cloth is placed are $1\frac{1}{4}$ inch in diameter, and upon each end is placed a tin cap, fastened to the roll by means of a single screw. The lower section of the rack admits of rolls of cloth 24, 26 and 28 inches in length, while the upper section has a capacity for 30, 32, 34 and 36 inch cloth. Fig. 246 of the illustrations shows the method of handling ropes adopted by Mr. Davis. The rack is placed in the cellar at such an inclination with the ceiling that the coils of rope do

Fig. 247.—Wire Catch for Holding End of Rope.

not interfere with one another. The end of the rope from each roll is passed up through holes in the floor and fastened to the end of the counter by means of a catch made of No. 12 spring wire. An enlarged view of this catch is shown in Fig. 247 of the illustrations. At the end of the counter and just above the ends of the rope is placed a sheet giving the weights and number of feet to the pound of the various sizes of rope in stock. All the goods upon the shelves are protected from dust by doors hung to narrow strips, with parliament butts, the whole being painted red. The method of showing samples adopted by Mr. Davis is to hang or screw them fast in front of the same goods found upon the shelves. By this means all the shelving space can be used to advantage, and permits of the goods being kept in original packages.

Movable Fronts for Stores.

An improvement in shop fronts was patented in this country not long since by John Gooch, of Brompton Road, London, Middlesex County, England. Patents on the same improvement have likewise been issued in Great Britain, France, Belgium, Norway, Germany, Sweden, Canada, Italy, Victoria, Tasmania, New Zealand, South Australia, Spain, New South Wales, Austro-Hungary, Queensland and India. It is evident from this impressive list of countries in which the invention has been secured that the author of the idea has faith in its utility and also in its general adoption by the business public. The improvement relates to those stores or shops in which the lower floor is used for business purposes and the stories above for residence. The object is to provide means by which the whole extent of the frontage between the side walls during business hours can be rendered available and used for the display of goods and for business purposes in general, and by which a side or private entrance can be provided when the store is closed. The invention consists essentially in features of construction of the shop front. The show windows and store entrance are adjustable relatively to other parts. During business hours the movable front part or parts are separated one from the other so as to open up an entrance to the store from the front, presenting at this time the conventional store with show windows at the sides and door in the middle. When this entrance is closed up by the reverse movement of the parts, the private entrance or entrances to the house as the case may be are brought into use. As a rule, where buildings are put up for the combined purpose of a store on the first floor and residence above, the latter connecting with the front by stairs, or with residence in the rear of the store,

communicating with the front by a side hall, it is necessary to sacrifice a portion of the width of the store, more particularly of the show windows. This invention proposes to utilize the entire front for show window and entrance purposes in business hours, and yet have the private entrance available for all other times. In the patent drawings mentioned one view shows a store front occupying the entire width of the building in business hours and showing two private entrances when the store is closed, and provided with a sliding or rolling blind adapted to come down to cover the entire store front when the private entrances are employed.

Business Methods.

A neat and effective method of bringing goods to the attention of the consumers is adopted by Hoopes, Brother & Darlington, Westchester, Pa., in a dainty pamphlet devoted to their Warner Wheel. As it may be suggestive to manufacturers or merchants in other lines we reproduce its substance below. The front cover contains the words, "For the man whose business it is to buy your wagons." The Warner Wheel is then referred to in the following terms:

Our Warner Wheel is never to fail at the weakest spot in other wheels. But what if it does?

Exact from your wagon-maker the bargain we make with him—new wheels for old if they fail at the hub, with no limit of time or anything else but unworkmanlike work on the wagon-maker's part.—See postscript.

It is better to make this guarantee through your wagon-maker. We make it to him; and he makes it to you. For we deal with him; and he deals with you.

We make, as most wheel-makers do, four grades of wheels, alike except the wood they are made of. We have to, besides, to humor the wagon-makers—there are just as many grades of wagon-makers as there are of wheels.

The best of oak and hickory grows in this part of the United States; but there is oak and oak, and hickory and hickory. Out of the self-same log are brittle and middling and good and tougher than steel.

There isn't nearly enough tough wood in the world to make the wheels all tough. There isn't any need of all the wheels being tough. Why tough wheels for a tender wagon? and most of the wagons are tender.

But, after a wheel is painted and varnished, who can tell the brittle wood from the tough till it breaks?

So go to the wagon-maker who, you judge—but make him prove it—will give you the best of wood in your wheels; then make him repeat our guarantee.

Most wheel-makers make four grades of wheels, we said; but they don't all use the same marks. Our marks have always been XX for best, X for next best, No 1 for next, No. 2 for next lowest—the worst we burn. But some of the makers mark their wheels XXXX, XXX, XX and X. Don't let those extra X's make you think their wheels are better than ours.

Half the wheels we make go to London and Paris. They are finding out on the other side where the best materials come from.

Now and then a Yankee imports a French or English wagon and gets our wheels. Two freights and a duty! No matter; salt water and a little jingle of silver don't hurt 'em. Such wheels are worth paying for.

The necessary cost of our wheels is very little more than that of the next-best make, whatever that make may be. But what do you think of a method of making that makes the weakest spot in a wheel the strongest? If the argument is as good as the wheel, you will want our wheels.

POSTSCRIPT.—We make this limit to our guarantee, if it is a limit: If a wagon-maker bores a hub for too large a box, he must take the risk, not we; the same if he puts on too light a wheel for the axle. These are what we mean by unworkmanlike wagon-maker's work.

This limit is proper for us, not for the wagon-maker. He can give you a still stronger guarantee. We take the risk of our wheels. Let him take the risk of his work in addition.

But the owner must keep his tires tight. It would be absurd to guarantee a wheel with the tires neglected.

Uniformity in Marking Goods.

A correspondent takes up the subject of uniformity in marking goods, and presents the following views:

Do those of your readers who are engaged in the sale of shelf goods extensively think of the great importance of system and uniformity in putting prices on such goods as tinware, wooden ware and general stock of housekeepers' articles? Is it not too true that much is left for guesswork, and the fact that a dinner-pail is generally sold for 25 cents fixes that as the figure until a competitor has made an advance or a cut in the price? Suppose they cost \$1.75 per dozen, and the dealer has adopted a general rule to add 50 per cent. profit on tinware. The pail would then be marked 22 cents, but nine out of ten would mark it either 20 cents or 25 cents, to make it "even figures." The trouble growing out of a lack of uniformity is that a part of the dealers charge 20 cents and a part 25 cents, and no one knows until he loses sales that he is charging too much. I am going to advocate a cast-iron rule of fixing a profit on all lines of goods and then marking them to the nearest figure, leaving out fractions. If it is 25 per cent. on wooden ware, and the dealer buys a lot of pails for \$2.25 per dozen, they will retail for 28 cents. On cutlery he thinks 33½ per cent. profit right, and a set of knives that cost 88 cents should be marked at \$1.17 per set—no more and no less.

Another mistake made by many dealers is to mark goods after looking at them and estimating what they will bring. A dealer thinks a bread or cake box looks big for its cost and will mark 75 cents for one that costs 35 cents. Here he is all at sea again—no rule or system, and the competitor that has a rule, and sells the cake box for 53 cents gets his full and fair profit, and a customer for future purchases. Many dealers are too much engaged in their financial and other office work to see to marking goods, and the invoice is given to a salesman who is supposed to know at what figure to mark the goods, but if he has a rule, as stated, he can make no mistake however little experience he has had. This plan of doing business leaves the more busy employees to attend to duties that need their especial knowledge. The same rule could be applied to stoves with only the slight variation of calling the retail price at the nearest quarter-dollar fraction. A stove costing \$11, and sold on a 33½ per cent. profit, would be worth \$14.66, but for convenience it could be marked under the rule \$14.75. In stoves there would need to be one line of profit for certain goods as the leading lines, and another for cheap goods.

A feature of my plan is that it could so readily be made the basis for mutual agreement with dealers who are in the same locality as to have a uniform asking price for goods. I am not in favor of combinations in which all in a trade agree upon their "honor" to sell at a certain price and never vary from it. I am too old for that by a large majority, and if I wanted to set men who had been life-long friends at enmity I would recommend a combination on prices. It is business-like and helpful, however, for dealers to fix a profit percentage on the various lines of goods they sell and will go a long way toward uniformity and fair prices. It is, moreover, an easy thing to agree upon, as there is so little detail to it. Perhaps the most difficult line would be in stove repairs, but to-day there is more uniformity in both

the wholesale and retail prices of castings, fire-brick, &c., than on any other goods sold. All that would be wanted would be a list drawing the line on heavy castings, like furnace fire-pots, for one line at a fixed percentage, and another for stove repairs, grates, cross-pieces, fire-brick, &c., all as simple as tin pans and shelf goods when understood. Now let us see the result and notice the advantage gained. A man wants a coal hod and is charged 71 cents for it. He first wonders why the 1 cent is put on and the next moment sees that it has been figured in a business way and that he is only charged the close price that the article could be afforded at. If the price given had been 70 cents, quite naturally he would want it for 65 cents and the seller is only required to say, in case a reduction is asked from the 71 cents, that it has been marked carefully at his lowest margin of profit, and the odd figures corroborate what he says. Then I would let the customer leave the article before I would take off the 1 cent!

The best proof I can offer that this plan is a good one is that I have tried it myself and obtained my theory from practice. The strongest hold that a merchant can secure on his customers is to show them that he runs his store himself, on his own money and in his own way, and that when he sells an article to a man who is not niggardly enough to "beat down" on it he pays no more than one who is a bore. The very highest position that can be obtained in mercantile life is to have a name that is a guarantee for the price put on the merchandise.

Excellent Work of a Spiegel Furnace.—Mr. G. C. Stone, of the New Jersey Zinc and Iron Company, Newark, N. J., gives us the following excellent record of one of the spiegel furnaces of that company: "We have now one furnace in blast, blown in May 15, and one out relining, to be blown in as soon as completed, probably about August 1. The furnace now out made the longest blast we have ever made here, and the longest run on spiegel that I know of, being in blast three years and two days. The product was:

	Tons.	Cwt.	Pounds.
First year.....	3340	10	70
Second year.....	3443	13	57
Third year.....	3090	8	79
Total.....	9874	12	94

The average yield of ore was only 31.5 per cent. The spiegel averaged 19.55 per cent. manganese. It required 2 tons, 9 cwt., 22 pounds of coal to the ton of iron, and made about 6000 pounds slag to each ton of iron."

Relative Value of Silver and Gold.

—In discussing the relative values of silver and gold, the London *Daily News* publishes figures to show that, notwithstanding the decline in the value of silver, its production has continued to increase at the same time that the annual supplies of gold have increased. Early in the present century the annual production of gold was about \$10,000,000 on the average. After the great Californian discoveries the production rose for a time above \$150,000,000, but for a series of years following the year 1859 the average was rather above than below \$100,000,000. Of late the production of gold has been somewhat under \$100,000,000 yearly. Of silver the supply varied between \$40,000,000 and \$52,500,000 for the 20 years ended with the year 1870; but no sooner did the value of silver begin to fall than the production steadily increased, until it is now nearly three times as great as it was a generation ago.

Expanded Metal.

The accompanying illustration represents a new metal product known as expanded metal. In form it resembles woven wire netting, and is intended to be used for the same purposes. It is made of sheet metal, cut in alternate slots by special machinery and expanded into open network, the sheets being increased in area from six to ten times, depending upon the size of the mesh. The cut gives a side view of the netting to show the

England, the South Atlantic States and the Central South, and propositions are being received from several parties desiring to take hold. An English syndicate is being organized to conduct manufacturing operations in Great Britain.

The machines now in use for the manufacture of expanded metal are somewhat similar to a cornice brake, but fitted with a series of knives or cutters, one for each slot. These knives make but one-sized cut, different meshes, therefore, requiring different machines. The sheets of metal

such as is used for flour sieves, fly screens, &c. A very large field is found outside of these lines, however, as will be observed by reference to the catalogue. Lawn fencing, elevator guards, aviaries, summer doors for ventilation, arbors, vine and vegetable supports, farm and railroad fencing, farm gates, flower-bed inclosures, delivery-wagon screens, store partitions, poultry netting, skylight guards, tree boxes, desk railing, window guards, swinging signs and even door mats are among the uses enumerated, to which can be added a variety of special places in which wire netting is found desirable. The same principle is applied in the manufacture of steel fire-proof lathing. The manufacturers point out one essential difference between wire netting and expanded metal which is worth noting. Wire netting for the heavier uses must be made to order, while expanded metal can be carried in stock and is easily cut with shears or cold chisel to any shape required without leaving broken ends to be pulled or dropped out, as in the case of wire. The catalogue comprises 47 pages of very interesting matter, which will be sent to any address on application to the company at 60 West Monroe street, Chicago.

Expanded Metal.

shape of the metal, both in the strands and at the points of union.

This article was invented in 1883 by J. F. Golding, of Chicago, and a patent covering the principle of its manufacture was obtained by him in 1884. Additional patents were subsequently secured on the different features of the machinery used to produce it. Oscar Bradford, president of the Curtiss & Co. Mfg. Company, and Henry S. Turner, of St. Louis, being convinced of the value of the invention, acquired an interest in it and contributed toward its successful development. In connection with Mr. Golding they have organized the Expanded Metal Company, controlling every feature of expanded metal and the necessary machinery in the United States and several foreign countries.

The usual difficulties were encountered in putting a new industry on a successful mechanical and commercial footing. Experiments in building machines were attempted at Chicago under the direction of the interested parties, but the only point accomplished was a demonstration of the practicability of the invention. Long & Allstatter, of Hamilton, Ohio, were then consulted, and they undertook to erect machines guaranteed to work, succeeding after a great deal of experimenting, which involved unavoidable delay. It is quite recently that all difficulties were surmounted, but three machines are now in full operation making expanded metal at the company's factory at Hermosa, six miles from Chicago, on the Chicago, Milwaukee and St. Paul Railroad. Facilities exist at these works for extensive operations when the growth of the business demands them. The Chicago office of the company is at 60 West Monroe street. Licenses to manufacture for exclusive territory have been issued to companies at St. Louis, San Francisco and Pittsburgh, in each of which places factories are or will shortly be in operation. Three other districts have been set off for exclusive control by separate licenses—namely, New

fed to the machine, of course, vary in size, according to the character of the product desired. A sheet 9 feet long and 7½ inches wide, for instance, is expanded to 3 feet in width but reduced to 8 feet in length. The sheet, after insertion in the machine, is fed automatically, cut and expanded at the same time, and is delivered without further attention. A 25 horsepower engine will furnish sufficient power to operate four machines. One machine will produce in ten hours, from No. 18 sheet, 10,000 square feet of expanded metal for use in window and skylight guards, around elevator shafts, in lawn fences, &c. The manufacturers claim for

The Diehl Fruit Press and Vegetable Strainer.

This article, which is manufactured by Paine, Diehl & Co., Philadelphia, Pa., is shown in the illustration given herewith, which represents the two parts separated. It will be recognized as substantially the same as the P., D. & Co. press and strainer, with a modification by which the plunger can be conveniently and quickly removed so as to facilitate its use and the emptying or cleaning of the cup. The manufacturers call attention to the very considerable improvement which is thus made in the press, adapting it to other uses and making it more convenient for those to which it has heretofore been applied.

Official trials of a new form of log have recently been made on board some of the French torpedo boats. The log is made of bronze of cylindro-conical form, and weighs about 5.5 pounds. It is provided with a hollow tube running down its center, which is connected by a canvas-

The Diehl Fruit Press and Strainer.

it great strength, as well as decided cheapness, in comparison with hand-woven wire. New uses are also expected for it, an inquiry coming from the engineers in charge of the Mississippi River improvements, who state that it is well adapted for the manufacture of mattresses used in retreating.

The company have issued an illustrated catalogue, which shows the great variety of purposes for which this netting can be used. At present nothing finer than 1-inch mesh is made, so that the expanded metal does not compete with wire cloth,

covered india-rubber tube to a pressure gauge on board. When the ship is under way the flow of the water past the log establishes a partial vacuum in the tube, and causes the pointer of the pressure gauge to move over its dial, which is graduated to give the speed of the vessel from 4 up to 25 knots.

Four artesian wells in Galveston are yielding copious supplies of water. The first one put down is expected to furnish, when completed, 1,000,000 gallons per day. It is not yet down 500 feet.

Some New Forms of Oil Cans.

We have referred in the past to the oil cans manufactured by W. J. Clark & Co., Salem, Ohio. In addition to the well-known lines that this firm have been supplying in the past, novelties are being continually brought out, and two of the most recent are shown in the accompanying engravings. The first represents a cheap form of can, similar in all respects to the C-jacketed can illustrated in these columns

Fig. 1.—Clark's C-Can without Jacket.

some time since, save only that the slatted jacket is omitted. The pump turns in its position, so as to make it convenient to fill a lamp at the side as shown. The pump is connected with the can by screws and a screw is also used at the top. The can is conveniently carried by a bail, and in all respects is portable, combining high utility with great convenience.

Figs. 2 and 3 represent what the firm describe as their rotating can. The can

Fig. 2.—Clark's Rotating Can as it Goes to be Filled.

is swung in a frame which serves as a handle to carry the can when it goes to be filled. The two engravings illustrate the use of the can so clearly that it will be understood without explanation. When the can is being used for filling a lamp it is set upon the edge of a table or bench as shown in the third engraving. Both hands may be used in handling the lamp, simply a finger being engaged with the spout to pull the can forward, as clearly shown in the cut. After the lamp is filled, by simply raising the lamp and thereby imparting the opposite motion to the can or releasing the pressure, the flow of the fluid is stopped. Referring to

the spout upon this can, it may be remarked that the passage of the oil is not through what would be regarded as the spout, but, instead, is through the brace or support under the spout. By this construction the can can be drained to the

Fig. 3.—Method of Using Clark's Rotating Can.

last degree. This can is claimed to be the only one of its kind that is trunnioned at the ends. It has advantages over side trunnioned cans in point of compactness, and the fact that it rotates within its own space. The contents are always in the same relation to the trunnions, and, accordingly, it is as easy to rotate the can when full as when it is empty, a fact that will be appreciated by all who have occasion to use such a device. There is never any surging of the contents to cause unsteadiness or spilling. The can is provided with an automatic spring locking device which holds it in an upright position whenever at rest, and prevents rotating accidentally in a way to spill the contents. The can is supplied with a large screw-cap filling hole, and as the spout is also supplied with a cap, the device is claimed to be absolutely air-tight, and therefore specially adapted for holding gasoline and other

Fig. 2.—The Boiler in Use.

similarly volatile fluids. In a letter recently received from this firm, they remark that they have been in this line of business since 1875, and have in that time produced an assortment of oil cans for family use which are very popular with the trade. They think, however, that in this new can

they overcome certain objections which have heretofore prevailed against swinging cans, and in support of this proposition mention that it has come into instant favor wherever introduced. The can does away with the labor of pumping, and the bother to which pumps out of order subject their users.

Water Boiler for Vapor Stoves.

J. W. Stoffel, of Mascontah, Ill., is introducing to the trade a patent water heater for use in connection with gasoline

Water Boiler for Vapor Stoves.—Fig. 1.—Perspective View with Side Partially Broken Away, Showing Internal Arrangement.

stoves, two views of which are shown in the accompanying illustrations. Fig. 1 presents the device detached from the stove, and with the side partially broken away showing the internal construction. Fig. 2 of the engravings shows the boiler as it appears when in use. It is constructed of sheet metal and provided with a cover which fits tightly. The principle upon which it works is that of the ordinary water-back, the supply entering the pipe at the base of the vessel, passing through the loop which encircles the central portion of the burner, becoming highly heated thereby and escapes to the boiler by means of the return pipe as shown in Fig. 1. This pipe projects upward to a

point near the top of the boiler, and is furnished with a cap which causes any steam generated to be thrown downward, tending to keep the water hot, while also avoiding noise. The device is simple of construction and adapted for use on vapor stoves of various descriptions.

Odd Jobs.

A new tool has been brought out by the Stanley Rule and Level Company, New Britain, Conn., and 29 Chambers street, New York. It is illustrated in Fig. 6 and is called Odd Jobs, in view of what it will do. It consists of a casting some-

Odd Jobs.—A New Tool Brought Out by the Stanley Rule and Level Company, New York.

what resembling a miniature house gable, with one round window in the end. The gable part, as we have familiarly described it, is a right angle, thus making the tool available for miter purposes and as a tri-square. The base is at right angles to the center line of the casting, thus adapting it for a level. The mercury-tube will be noticed in the cut. The tool is to be used for various purposes in combination with a rule, and, for that reason, the back of the casting is channeled out just the right width to receive an ordinary 2-foot rule when closed. The little set-screw shown at the left in the cut engages with the edge of the rule and holds it in place. With the rule inserted the range of work that may be accomplished will be readily perceived. No less than ten special uses are enumerated in the circular put forth by the company. These are as follows: A (1) tri-square, which is so evident that it does not need any explanation. The same remark also applies to (2) miter square. By combining with the rule and extending one end of the rule below the square head or base already referred to, a (3) T-square is secured. By keeping the rule in the same position and using a pencil or scratch awl in the angle of the rule as shown in the cut (4) a marking gauge is obtained. In the same manner a (5) mortise gauge is secured. By reversing the rule and allowing the opposite end to project beyond the base, a (6) depth gauge is formed. A (7) miter level and also a (8) spirit level are secured in a way already described. A plumb is derived by a line brought against the top and bottom projections as indicated at the right of the engraving. Referring to the cut, near what we have called the gable of the casting, will be noticed a sharp point. This is in line with the end of the groove or channel for the rule on the back. With the rule in the position already indicated, and using the point referred to as a center, a (9) compass or

device for striking circles is obtained and that, too, with the means at hand for adjusting the radius to suit circumstances. Instead of using the rule as above described, the long scribe or point, shown at the right, may be employed, as shown in the cut. The end of the rod opposite the point is adapted to receive and hold a pencil, thus still further increasing the utility of the article in this regard. By using the right-angled edges at the top, which we have familiarly described as the gable of the casting, an (10) inside square for boxes and frames is obtained. We are not altogether certain that the above enumeration covers all the uses to which this tool can be put, but we give them as the enumeration which the company have made and leave our ingenious readers to discover still others. Using the tool as a beam compass, it has a capacity of from 1½ to 13 inches diameter. Smaller circles can be made by reversing the steel rod so as to bring the pencil near the center point. A circle of 25 inches diameter can be swung if the rule alone is used with a pencil in the angle at its head. This little article is being supplied nickel-plated, put up in neat boxes and is a most desirable addition to any carpenter's kit.

Improved Bench Drill.

A few months since we presented in these columns a form of bench drill manufactured by Messrs. E. C. Stearns & Co., of Syracuse, N. Y. In the engraving annexed we show an improved form of the same drill, the special feature being the adjustable bed-plate, which may be raised or lowered to accommodate various styles and sizes of work. It is so constructed, it is stated, that by simply turning a crank the spindle is rapidly fed down to the work and as quickly withdrawn. The drill is 26½ inches, measured

Stearns' Improved Bench Drill.

from the base of standard to top of balance-wheel, and weighs 29 pounds. It is claimed to have a capacity for drilling any size of hole at a right angle with the bed-plate, from ¼ inch down to the smallest required. The drill-stock is 1½ inch in diameter, the run of the screw 3½ inches and the weight of the balance-wheel 6 pounds. With each drill is furnished a chuck, which attaches to the

spindle and holds a ¼-inch round drill or an ordinary square-tapered shank or brace drill. The drill is made of the best material, the main standard is neatly japanned, the hand wheel nickel-plated, the balance-wheel painted vermilion, while the bearings are finished with standard size reamers, with all parts interchangeable. The crank, as will be noticed by referring to the engraving, has an extension for large drilling, and the manufacturers state there are proper allowances for strength and durability.

Agate Spinner.

This toy is manufactured by the Wire Goods Company, Worcester, Mass., and is represented full size in the accompanying

Agate Spinner.

cut. Its use is sufficiently indicated in its name and in the illustration. It is stated that by means of it an agate may be made to spin on a dinner plate or other smooth surface from five to eight minutes. These articles are packed in neat boxes, containing each one spinner with agate, ready for retailing, having on the outside full directions in regard to the manner of use.

Continuous Steam Heating for Cars.

—In summing up what was said of continuous steam heating for cars at the recent Master Car Builders' convention the *Railroad Gazette* remarks: "It seemed to be generally acknowledged that the results given by the various systems used were fairly satisfactory. It was also noticeable that while no reference was made to the difficulty of heating cars should the engine be stalled or break down on the road, numerous speakers stated that they had made arrangements for keeping the cars heated while they were standing at stations, junctions and terminal points. It seems to be a very general practice to keep the cars warm throughout the whole winter and to couple them up to a stationary boiler when the cars are standing and the locomotive is not available. None of the speakers appeared to have found any difficulty in carrying this into effect, while no complaint was made that the quantity of steam used in heating formed an appreciable tax on the steaming power of the locomotive."

The limited partnership of William D. Marvel & Co., Nos. 68 and 70 William street, has been dissolved by mutual consent. The Marvel Iron Company, Limited, and William D. Marvel will continue business at the same address.

THE IRON AGE

THURSDAY, JULY 12, 1888.

Electric Welding Machines.

In our issue of March 1, 1888, we referred briefly to the process of electric welding as carried out at the works of the Thomson Electric Welding Company, at Lynn, Mass. In view of the interest attached to the subject we need not specially commend to the attention of our readers the engravings on this page, illustrating two types of machines by means of which their welding is accomplished.

The principle involved in this new art is that of causing currents of electricity to pass through the abutting ends of the pieces of metal which are to be welded, thereby generating heat at the point of contact, which also becomes the point of greatest resistance, while at the same time mechanical pressure is applied to force the parts together. As the currents heat the metal, at their junction, to the welding temperature, the pressure follows up the softening surface until a complete union or weld is effected, and, as the heat is first developed in the interior of the parts to be welded, the interior of the joint is, it is claimed, as efficiently united as the visible exterior. With such a method and apparatus, it is found possible to accomplish not only the common kinds of welding of iron and steel, but of metals which have heretofore resisted attempts at welding, and have had to be brazed or soldered. Pieces of such metals and alloys as wrought iron, silver, copper, brass, lead, tin, zinc, bronze, German silver, platinum, gold and even cast iron, are not only welded to each other, but different metals can be welded one to another in many combinations, extending the applications of the process to the attainment of results heretofore impossible in metal working, while the tensile strength of the welds, as shown by mechanical tests under the direction of the U. S. Ordnance Department, are all that can be desired.

The machines built by the Thomson Electric Welding Company are generators of electricity, so constructed as to produce

the low pressure currents needed in welding and similar work. They are of sizes and types suited to the kind and scale of work, as well as to the nature and location of the power by which they are to be driven. They are built to take power

of work, from the smallest wire to bars of over 8 inches in diameter. For heavier work, such as large forgings of locomotive frames, car axles, shaftings, &c., special forms of machines adapted to the purpose can be supplied by the company,

while by the use of specially adapted holders, applied to the standard forms of machines, various shapes and irregular sizes of metal pieces may be welded without difficulty. The power required for the different sizes varies nearly as the cross sectional area of the material at the joint where the weld is to be made. The welding or working is claimed to be much more economical and far superior to that produced by the ordinary methods, while the currents used are of such low pressure as to render any danger of shocks impossible.

Fig. 1 represents an indirect welding machine as now built for moderately heavy work, such as metal bars of about 2 inches in diameter. This machine takes a current from a dynamo by means of wires and may be placed in any convenient location, more or less distant from the source of power. Fig. 2 represents a type of the direct welding machine, combining both the dynamo and welding apparatus. This can be run by belting directly to the engine or to line shafting. This machine is used for all kinds of light work, its capacity ranging from fine wire to rods of $2\frac{1}{4}$ inches in diameter. The welds, it will be understood, are butt welds and the rods to be united are securely clamped in two arms. This the engravings show clearly.

We need not specially emphasize the fact that the variety of uses to which the process of electric welding may be applied is almost endless. Thus it is adapted to the joining of wires of copper, iron or other metals, or bars of similar or different shapes and sections; making joints at angles with bars, as T or Y joints; making chains of links with double welds, both joints being formed by one operation and ranging from cable work to jewelers' chains, combining the same or different

Fig. 1.—Indirect Welding Machine.

Fig. 2.—Direct Welding Machine.

ELECTRIC WELDING MACHINES, BUILT BY THE THOMSON ELECTRIC WELDING CO., LYNN, MASS.

from any source; to operate wherever placed, by producing directly from such power the necessary currents, or to be supplied by currents taken from a circuit, fed by suitable dynamos at a greater or less distance from the welding apparatus itself. The machines now being manufactured are so graded as to apply to various kinds

ing of wires of copper, iron or other metals, or bars of similar or different shapes and sections; making joints at angles with bars, as T or Y joints; making chains of links with double welds, both joints being formed by one operation and ranging from cable work to jewelers' chains, combining the same or different

metals; constructing or joining, end to end, pipe of all kinds and of large diameters; the working, joining, &c., of lead pipe and the welding in of T connections or elbows into lines of pipe, &c. The operator has absolute control over the heat as, by the simple movement of a lever, the metal can be held at any temperature desired. The welding process, moreover, can be continually watched, as the metal while heating is visible, instead of being covered with coal or hidden by flame, as in the ordinary process. The union further commences at the interior of the joint and not in an uncertain way, as in the ordinary lap welding, and consequently any flaw in the process, it is claimed, can be easily discovered and prevented. The process is almost instantaneous with small diameters, while with larger sizes it requires but a few seconds, depending upon the horse-power used. The external part of the welding circuit is so contrived as to be practically a pair of clamps into which the pieces to be welded may be fastened close to the ends to be joined, so that when these ends are in contact an electric ring circuit is completed, consisting of the part included within the primary coils, the clamps and the metals to be welded. The energy spent in this circuit is easily regulated, and is thus adapted to the demands of the work to be done, whether it be with thick or thin bars or wires. None of the energy is wasted, and there is no expenditure at all when the welding is not in progress.

The Ohio Valley Centennial Exhibition.

The Centennial Exhibition of the Ohio Valley and Central States, active preparations for which have been going on for 12 months past at Cincinnati, Ohio, was opened on Wednesday, July 4, 1888.

The machinery department has an exceptionally fine collection of iron and wood working tools, and is considered fully equal to, if not greater than, that of the Centennial Exposition at Philadelphia in 1876. The G. A. Gray Machinery Company, Cincinnati, exhibit at the main entrance to Machinery Hall, a 10-foot bed planer, 36 inches by 36 inches, with double heads, power quick elevating device, quick return and short run, weight, 13,000 pounds; one single head 5-foot bed, 26 inches by 26 inches, with power elevating device, and one 5-foot bed, 23 inches by 23 inches ditto. All of these machines have a new device for shifting the belts. The machines are highly finished, and especially designed for great durability. This company also exhibit one screw cutting lathe with 26-inch swing, 13-foot bed, compound rest, independent rod feed, weight, 8000 pounds; also one 20-inch swing and one 17-inch, both with 8-foot beds, having compound rests and taper attachments.

The Long & Allstater Company, Hamilton, Ohio, have two exhibits, one embracing a 6-inch angle iron shear, cutting from $\frac{1}{4}$ inch to $\frac{3}{4}$ inch thick; one 3 inches thick; one large plate shear, cutting any size or width of plate; one plate shear and multiple punch combined, shearing up to 50 inches in width by $\frac{3}{4}$ inch thick; one 36-inch deep throat boiler punch, No. 2 size, with capacity for punching through $\frac{3}{4}$ -inch iron; one double No. 3 punch and shear combined; one No. 3 horizontal punch; and one tire welding machine for welding wagon and buggy tires. This machine is one of their latest productions. The welding dies are adjustable by means of cams, the female die remaining stationary, while the male and edging dies are

adjustable to $\frac{1}{8}$ inch, the machine welding tires from $\frac{1}{4}$ inch to $1\frac{1}{2}$ inches wide. Two sizes of this machine are made, each being provided beneath the edging die with a shear attachment for cutting the tire material to the lengths desired. This firm further exhibits a powerful bending and forming machine, also adapted to straightening heavy bars, beams, &c., and for shaping iron suitable to all purposes. Another portion of the hall is occupied by this firm, with a space in which is exhibited every variety of agricultural implements, consisting of rakes, cultivators, plows, feed cutters, &c.

Ritchie & Deyer, Hamilton, Ohio, exhibit a model Parry saw-mill outfit and a 10 horse-power Ritchie traction engine. This has steel gearing and a steel boiler and is well put together. The firm claim to have built the first engine of this type ever used in the United States.

Cordesman, Meyer & Co., Cincinnati, Ohio, manufacturers of wood-working machinery, exhibit some of their latest and best productions, consisting of tilting saw tables, band saws, jointers, planers and mortisers, the whole making a very creditable display.

The Falls Rivet Company, Cuyahoga Falls, Ohio, exhibit their several specialties, consisting of their patent clutch and cut-off couplings, steel-rim pulleys, split pulleys, pedestal stands and boxes and Akron cold-rolled shafting. This firm have supplied the electric light plants at the exposition with shafting and couplings. The clutches are made from 1 to 1000 horse-power, with two, four and six arms.

The National Steel Wire Mat Company, with factories at Cincinnati, Chicago and Beaver Falls, Pa., have an interesting exhibit in the southern end of the hall, consisting of a complete manufacturing plant in operation producing specimens of their goods, the wall space of the exhibit being appropriately decorated with wire mats of the various sizes made. The machinery employed in the manufacture of these goods proves a great attraction to visitors.

The Van Duzen Gas Engine Company, of Cincinnati, have two displays of their gas engines, one immediately adjoining the main entrance to the machinery hall, and the second in the south end. The exhibit consists of 2, 4 and 7 horse-power engines of a new type. They are provided with automatic lubricator similar to the Westinghouse engine, which latter they closely resemble in form, and are claimed to be economical in consumption of gas.

The Iowa Farming Tool Company, Fort Madison, Iowa, have a unique display in pyramidal form, some 20 feet high, 8 feet square at base, and 3 feet 6 inches at apex, consisting of a dark background upon which are secured specimens of the various tools and implements produced by them. A smaller pyramid is used for the display of grain cradles, snaths, ox yokes, &c.

Mast, Foos & Co., Springfield, Ohio, make an elaborate display of iron fencing of various designs, the well-known Buckeye Force Pumps, lawn mowers and their Iron Turbine wind engines, hose reels lawn sprinklers, &c.

The Eagle Machine Company, Lancaster, exhibit well-gotten-up specimens of their hand and power cornshellers, fodder cutters, straw cutters, stackers, screen doors, corn planters, animal pokes, horse-powers, &c.

The Kilbourne & Jacobs Mfg. Company, Columbus, Ohio, exhibit a specimen of every article manufactured by them, embracing wheelbarrows, both wood and iron, wheels, the well-known Columbus steel sinks, road plows, scrapers and express, railroad and freight trucks.

The Wayne Works, of Richmond, Ind., exhibit grain drills, seeders, force feed fertilizers, and their latest novelty, the

Dandy champion steel cart, of which several styles are exhibited. These carts are constructed with single and double seats, are easy of adjustment, and have a superior device in the way of spring.

The Richmond Machine Company display mule and gang saws, head blocks and horizontal engines.

The John H. McGowan Pump Company, Cincinnati, have on exhibition a very interesting display of their Rival boiler feeders, Rival and Duplex steam pumps and the Glide brass valve-box boiler feeders, tobacco presses and machinery. The center of their space is occupied by a water column about 12 inches in diameter and 15 feet high, the top of which is surmounted by a basin about 6 feet in diameter. In the center of this is located a flower vase. The water is forced through the column, filling the basin mentioned to overflowing and producing a very pleasant effect, particularly at night, and cooling the atmosphere very perceptibly for some distance around.

J. M. Robinson & Co., occupying space 9 x 25, exhibit several of their more prominent productions, among which are cornice brakes ranging from 4 up to 8 feet in size, range and safe makers' brakes, box bending machines, hand and power shears, double-acting punching presses, both hand and power.

Pierce, Butler & Pierce, Syracuse, N. Y., exhibit all the various sizes and combinations of the Florida steam heater.

Sebastian, May & Co., Cincinnati, Ohio, have a very fine exhibit of light iron working lathes running in sizes from 8 inches swing up to 18 inches, with distances between centers from 20 to 60 inches. In connection with their exhibit is also a display for Rice, Whitacre & Co., of Chicago, manufacturers of the Kriebel steam launch engine.

The National Machinery Company, of Griffin, Ohio, exhibit various sizes of bolt and nut machinery, of which they make a specialty.

The Laidlaw & Dunn Company, Cincinnati, exhibit a complete line of the Hero vertical boiler feeders, Standard Duplex pumps with brass removable water cylinders, tobacco machinery, &c. Six of these pumps are being used to supply the feeding of the Galloway boilers in the Park Hall, the elevator in the same hall supplying water to the grand waterfall in Horticultural Hall and the grand fountain in Park building. This firm also supplied all the pipe, fittings and valves for steam, water and fire purposes, and pipes and fittings for the extensive gas display in the buildings and streets approaching thereto, and the great electric light chandelier in Music Hall.

Lodge, Davis & Co., Cincinnati, occupy one of the largest spaces in the hall, and exhibit the most comprehensive display of machine tools in the entire building. The exhibit consists of five sizes of turret lathes, 13, 16, 18, 21 and 36 inches. The last three are cabinet styles for boring, chasing and turning taper without swiveling the head. A line of shapers is also exhibited, there being four sizes, 15, 20, 26 and 32 inches. The first three are geared and the 15 inch, operated with a rocker movement, has quick return and is fitted with a special device for altering the length of the stroke from 0 inch to 15 inches while in motion. There is also a device for adjusting the cutting tool to any location in which the work may be placed on the table. The shapers can be rapidly adjusted while in motion, and a shaft of any length may be put clear through directly under the cutter arm, thus enabling the operator to cut a key-way in a shaft at any point desired. All shapers are arranged to make any required changes from one point. A full line of drill presses are also exhibited, ranging in size from 20 to 38 inches swing.

The Coke Trade.

The lockout in the Western iron mills, which is now in its second week, has not as yet had any perceptible effect on coke shipments, nor will it be likely to have any for some weeks to come, should the lockout continue. A more hopeful feeling is being shown by the operators, and it is believed that an improvement in this industry will soon take place. For the week closing June 30 there were 9255 ovens in blast, out of a total of 13,061 ovens in the region, leaving only 3806 idle; the output for that week being estimated at 74,664 tons. For the week previous the figures were: Active ovens, 8903; idle, 4156; tonnage, 72,166. The resumption of a portion of the ovens of the McClure Coke Company which had been idle on account of a strike of the employees, accounts in part for the increase in the number of active ovens and the slight increase in tonnage. The shipments during the week were 4560 cars consigned as follows:

Fig. 1.

Fig. 2.

Fig. 3.

Fig. 4.

Fig. 5.

Fig. 6.

LATHE AND PLANER TOOL, MADE BY THE CAPITOL TOOL COMPANY, HARTFORD, CONN.

To Pittsburgh and the rivers, 1200; to the Shenango and Mahoning valleys, Chicago and other Western points, 2060 cars; to eastern points, 1300 cars. The figures for the previous week were: Pittsburgh, 1250; West, 2000; East, 900. The following is a comparative statement of the weekly shipments for the month of June:

	June	9	16	23	30	Total.
To Pittsburgh.....	1,200	1,250	1,250	1,200	4,900	
To Western points.....	3,000	2,400	2,000	2,080	9,480	
To Eastern points.....	1,350	1,150	900	1,300	4,800	
Totals.....	5,550	4,800	4,150	4,580	19,160	

The shipments for May were 24,800 cars, or an average of 918 cars per day for the 27 working days of that month. The shipments for June, as will be seen by the above statement, aggregate 19,160 cars, or an average of but 737 cars daily for the 26 working days of that month. The aggregate for May was consigned as follows: To Pittsburgh, 4300 cars; West, 13,800 cars, and to eastern points 6700 cars. The price of coke remains at \$1, although some sales have been made at 95 cents per ton. There is still some talk of an attempt to revive the old syndicate. Although no definite action has yet been taken in the matter, it is not likely that any decided efforts will be made to form a new syndicate until there

is some improvement in the iron trade, which will consequently cause an improvement in the demand for coke.

Seymour's Lathe and Planer Tool.

The Capitol Tool Company, of Hartford, Conn., are putting on the market a lathe and planer tool which, in general plan, may not be altogether unfamiliar to our readers. The engravings which we annex fully explain its features. The tool is designed to be an efficient and cheap substitute for forged tools for lathes and planers, rigidly holding its cutter and taking as heavy and clean cuts as a forged tool of the same size. It is cheap to use because the cutters are made by cutting from a bar of steel the length required and grinding the end to the desired angle. This plan allows the consumer to make his own cutters at small cost. It does not require an elevating tool block on the lathe, as the cutter can be raised or lowered in

Naval Progress.

The acts of March 3, 1885, August 3, 1886, and March 3, 1887, authorized the construction of ships to cost in the aggregate a trifle less than \$20,000,000. The amount thus far appropriated for these ships is \$8,315,000. This is exclusive of about \$7,000,000 appropriated for guns and armor in 1886 and 1887, of which about \$4,000,000 will be required to pay the contracts made with the Bethlehem Iron Works a year ago, leaving \$3,000,000 to the credit of the Secretary.

Leaving out the double-turreted monitors and the four cruisers, there have been spent on the ships ordered in the past three years \$2,403,935, and the balance on hand for them is \$3,453,848. The double-turreted monitor Miantonomoh will be finished in four months. The large cruiser Baltimore will be launched this month and finished in six months. The Vesuvius will be ready for delivery on September 1. The double-turreted monitor Puritan has had

her dock trial and has been accepted, but her armor has not been put on. The double-turreted monitor Amphitrite is ready for her steam trial, which will occur soon. The machinery for the double-turreted monitor Monadnock is in process of construction at Mare Island Navy Yard, from plans prepared in the Navy Department. Three years ago some of the forgings for the 6-inch guns for the Navy had to be imported from England, and all the forgings for the larger guns had to be brought from abroad. Now the forgings for 8-inch guns are made here, and the contract of last year with the Bethlehem Iron Works will make the United States independent of England, even in the case of forgings for the largest guns projected and for the heaviest steel shafting.

The stern-post of the cruiser San Francisco, which is to be built by the Union Iron Works, in San Francisco, has been successfully cast and the keel is now being laid. The Herreshoff Mfg. Company, at Bristol, R. I., have begun work on the new torpedo boat. This boat will be 138 feet long and will have twin screws, with engines capable of working up to 1800 horse-power. The contract speed is 25 knots an hour and the builders hope to attain 28 knots. The boat will be entirely of steel.

The Cruiser Maine.

The progress which is being made in the preparations for commencing the building of the cruiser Maine, at the Brooklyn Navy Yard, lends special interest to the engravings which we publish in this issue, representing a general view and deck plans of the ship.

The Maine is a twin-screw armored turret vessel of the belted cruiser type, the vital parts being protected by a belt of armor from shot and shell, sufficient in length to insure stability even if the ends are riddled above the under-water protective decks extending from the ends of the belt to the extremities of the vessel. The vessel will have great coal endurance, good steaming and maneuvering qualities, every modern improvement in offensive and defensive *matériel* and every appliance to insure the comfort and health of officers and crew. In general appearance it resembles the Brazilian armored cruiser Riachuelo, but is larger, and carries heavier guns and thicker armor, besides having greater endurance. The general dimensions are as follows: Length between perpendiculars, 310 feet; breadth, extreme, 57 feet; mean draft of water, $21\frac{1}{4}$ feet; displacement to above draft, 6648 tons; indicated horse-power, 8750; speed, 17 knots; thickness of armor belt, 11 inches. The water-line belt of steel armor just mentioned extends for a length of about 180 feet amidships, and from 3 feet above to 4 feet below the water line. From a point 1 foot below the water line the thickness of the armor gradually decreases to 6 inches at the bottom. The wood backing is 8 inches thick. The plating behind the armor is in two thicknesses, stiffened by horizontal angle bars. The athwartship armor bulkhead at the forward end of the armor belt is 6 inches thick. The revolving turrets are protected by $10\frac{1}{4}$ inch steel armor, the gun port plates being $11\frac{1}{4}$ inches. The revolving parts of the turrets and the spaces required for loading are protected by fixed breastworks of oval shape, $10\frac{1}{4}$ inches thick. There is an armored conning tower, 10 inches thick, located on the central superstructure, elliptical in shape, measuring 10 feet 6 inches by 9 feet. An armored tube $4\frac{1}{2}$ inches thick runs from this tower to the armor deck, to protect steering gear, speaking-tubes, &c. The armor deck plating in the works of the armor belt will be in two thicknesses, so disposed that one layer of plating forms edge strips and butt straps for the other. The armor deck slopes from the top of the belt at its after end, the slope being 4 inches thick. The under-water deck at the end is 2 inches thick, protecting the magazine and steering gear, and so arranged as to give great stiffness to the ram bow. Cofferdams will be built above the engine and fire-room hatches to a height of 3 feet above the berth deck.

The vessel is bark rigged, spreading 7135 square feet of canvas. The fore and main masts are fitted with military tops, each mounting two machine guns. The rigging is brought down in such a manner as not to interfere with the fire of the guns. In addition to the armored conning tower there is a wooden chart-house, fitted with chart tables, speaking-tubes, indicators, steering-wheels, &c., for use when not in action. A steam steering-engine is fitted, in addition to the hand-steering arrangements, and there are steam capstans, windlasses and hoists. The forward hawse-pipes are so formed as to be adapted to a stockless anchor, the entrance being enlarged to take the shank and flukes of the anchor, the latter stowing itself automatically within the ship on heaving to. Shutters will be fitted over the mouths of the hawse-pipes. There are 174 water-tight compartments in the

U. S. ARMORED CRUISER MAINE, TO BE BUILT AT THE BROOKLYN NAVY YARD.

Main and Superstructure Decks.

vessel and ample provision is made for natural light and ventilation by means of skylights, side-lights and cowls. Artificial ventilation is also provided for. The vitiated air of the engine-room will be withdrawn by the fans used for forced combustion. The explosive gases of the coal bunkers are led into the funnel casings and fresh-air pipes lead to the upper deck.

The pumping and draining system is very elaborate, every compartment of the vessel being in connection with powerful steam and hand pumps. The electric plant consists of four sets of dynamos and engines, so connected that any one can supply all the circuits for the incandescent lamps. There are three search-lights, any of which can be connected with any dynamo. These dynamos supply also light for internal illumination, side-lights, head-lights and lights in magazines and bunkers. In addition to the usual allowance of boats supplied to a man-of-war, including steam launch and cutter, there are two torpedo boats, 60 feet long. The height in the clear between the berth-deck planks and bottom of the main-deck beams is 7 feet 10 inches. The height in clear between the main-deck plank and bottom of super-structure decks is 6 feet 8 inches.

The vessel will have two vertical inverted triple-expansion engines in separate water-tight compartments, capable of developing 8750 horse-power. The cylinders are 35½, 57 and 88 inches in diameter respectively, with a stroke of 36 inches. There will be eight cylindrical return tubular boilers, 14 feet 8 inches diameter and 10 feet long, each having three furnaces, the total grate surface being 552 square feet. The fire-rooms are not to be put under pressure, but the forced draft will be secured by leading air to the under side of the grate-bars, forced through ducts by four blowers of 26,000 cubic feet capacity per minute. There are two three-bladed screws with a diameter of about 15 feet. The coal at normal draft is 400 tons, but the bunker capacity is 822 tons. The endurance and radius of action at different speeds with 400 tons of coal are: At 17 knots per hour, 960 knots; at 15 knots per hour, 1617 knots; at 10 knots per hour, 4250 knots.

The main battery consists of four 10-inch and six 6-inch breech-loading guns. The 10-inch guns are mounted in pairs in turrets protected by 10½ inches of steel armor. The turrets are placed *en echelon*, so that four guns can be fired ahead or astern. Each has a complete broadside train on one side of 180° and on the other side of over 60°. Each turret has two loading positions. The guns are loaded, elevated and trained by the latest and most approved systems, all machinery being protected by oblong breastworks 10½ inches thick. The 6-inch guns are mounted on central pivot carriages, protected by segmental steel shields 2 inches thick. Two 6-inch guns are placed directly forward and two directly aft, having a train each of 147°. A 6-inch gun is mounted on each side of the central superstructure having a train of 130°. The forward and after guns can be converged at a point 150 feet from their respective ends. The four 10-inch and two 6-inch guns can be fired directly ahead or astern, and the broadside fire of four 10-inch and three 6-inch guns can be converged at a point 100 feet from the side. The secondary battery is so disposed as to secure a heavy bow and stern fire. It consists of four 57 mm. rapid-fire guns, four 47 mm. rapid-fire guns, four 47 mm. revolving cannon, nine 37 mm. revolving cannon and four Gatling guns. There are seven torpedo launching tubes or guns, three below the water and four on the berth deck. The 10-inch guns fire a projectile of 500 pounds weight with 250 pounds of powder, and have a maximum

effective range of about 9 miles. The weight of shot that can be fired ahead or astern from the main battery is 2200 pounds, and either side 2300 pounds.

The Hall Electric Pump.

The Hall Electric Pump Company, of Plainfield, N. J., with New York offices in the *Tribune* Building, have just made an interesting application of electricity to pumping for domestic water supply. The result is the Hall Electric Pump, of which we annex an engraving, and which is simply a combination of a rotary pump and an electric motor, the power being transmitted from the motor to the pump by a worm gear.

The illustration shows a motor of $\frac{1}{4}$ horse-power. The worm on the motor shaft is of steel and runs in a box of oil; the pinion attached to the pump shaft is of best bronze; the pump, of the most improved

the pump is at work refilling the tank, and it will not stop until the normal level is regained, when the rising float cuts the circuit and stops the motor. This automatic action of the machinery constitutes its leading recommendation. The electrical current being provided the motor and pump are always ready, and there is no use for attendance other than a weekly or fortnightly supply of oil.

The Metal Schedule Before the House.

On the 3d of the month the metal schedule was finally reached by the House, after a lengthy discussion relating to the duty on glass, which crowded over into the consideration of the iron duty, practically cutting off any discussion on the latter. Mr. McKinley offered as an amendment to make the duty on pig iron \$6.72—an amendment which was rejected, leaving the rate as now proposed under the Mills

attention to the fact that while the rate is \$6 per ton for pig metal it will be only \$8, or about that, for steel slabs.

Mr. Dalzell seized the occasion to review the statements of Mr. Scott, of Erie, in regard to the cost of manufacturing steel rails at the Edgar Thomson Works. He stated that the cost of spiegeleisen or ferromanganese in every ton of steel rails produced in this country in 1887 was about \$3, an item which Mr. Scott had entirely overlooked. He objected also to the figure given as the market price of 1 ton of No. 1 Bessemer pig iron at the mill as \$18, holding that during the year 1887 a fair average would not be less than \$20. Mr. Dalzell succeeded also in putting on record the well-known letter of Mr. Andrew Carnegie to Mr. James M. Swank, in reply to the statements of Mr. Scott on the alleged profits made by the Edgar Thomson Steel Works. Then the amendment proposed by the member of the Ways and Means Committee, striking out "steel slabs and billets," was agreed to. The bar iron clause was then reached, J. H. Moffit, of New York, proposing as an amendment that all charcoal iron be subject to a duty of not less than \$22 per ton, instead of \$20, as proposed by the Ways and Means Committee. Mr. Moffit, who has been actively engaged in the manufacture of charcoal iron on Lake Champlain for the past 16 years, gave the following statement of cost of manufacturing a ton of charcoal bloom iron in the Lake Champlain district:

7½ cords of coal wood on the stump (which is the amount required to manufacture a ton of iron).....	\$0.75
Cutting and hauling, at \$1.50 per cord.....	11.25
Coaling and delivering 340 bushels of charcoal.....	7.00
Mining, separating and transporting 2 tons of ore.....	18.00
Making and hammering the iron, including superintendence.....	8.00
Maintenance of plant.....	2.00
Total.....	\$42.00
Deduct value of wood on the stump \$0.75.....	
And ore in the ground.....	\$1.05
Labor cost in each ton.....	\$40.95

Mr. Moffit presented an official statement of the output of ore blooms in the country for a series of years, and showed that it had been steadily declining in spite of the fact that the quality of the product is equal to that made anywhere else. The amendment, however, was rejected, the clause standing as originally proposed. Mr. Burrows showed a rapid development of the iron trade during the last 40 years, and presented a number of abstracts from the testimony given before the Tariff Commission, to show how prices have been reduced to the consumer during the period in question.

Mr. R. W. Townshend, of Illinois, had an interview read with N. O. Nelson, of the N. O. Nelson Mfg. Company, of St. Louis, in which that gentleman put himself on record as an opponent of a protective tariff. This was met by the presentation by N. W. Nutting, of New York, of a letter written by J. W. McGranahan, of New York, to the editor of the *Tariff League Bulletin*. The House then drifted into a general debate, largely political in its character, which did not deal with the questions directly at issue, so far as the metal schedule is concerned.

Mr. W. H. Sowden, of Pennsylvania, moved that the following clause be amended: "Iron and steel T-rails, weighing not over 25 pounds to the yard, \$14 per ton; iron or steel flat rails, punched, \$15 per ton." Mr. Sowden's amendment is to substitute "\$17.92" for "\$14," and "\$20.16" for "\$15" from the above clause. This amendment was also rejected, and the House passed to the following item: "Round iron, in coils or rods, less than $\frac{1}{4}$ inch in diameter, and bars or shapes of rolled iron not specially enumerated or

ELECTRIC PUMP, BUILT BY THE HALL ELECTRIC PUMP COMPANY, PLAINFIELD, N. J.

rotary principle, is also of bronze; the bed plate is of iron. Self-feeding oil cups, each containing one or more week's supply of oil according to the work required, keep all bearings lubricated, and when the pump is at rest no oil escapes. The floor space required is 15 inches by 16 inches, and the height of the pump is 12 inches. A neat hardwood case keeps out all dust or dirt and prevents meddling with the motor. The electricity must be taken from a dynamo, and either an arc or an incandescent circuit can be used, but the latter is always preferable on account of its safety. In the tank a snap electric switch regulates the supply of water. A common ball float attached to the switch closes or cuts the circuit as water is drawn off, or is returned to the tank.

The action of the pump is purely automatic. Connection is made with the electric circuit by the two wires shown at top of motor and at the switch in the tank. Water is drawn in a bathroom, in the kitchen, the laundry or bedroom, and as soon as the ball float has dropped to the point to which it is regulated, the switch is snapped by the weight of the ball in falling, the circuit is closed, and instantly

bill—\$6 per ton. An amendment to strike out the clause, "Iron railway bars weighing more than 25 pounds to the yard, \$11 per ton," was rejected, leaving the rate as proposed. Mr. McMillen, a member of the Ways and Means Committee, proposed to strike out the words "slabs and billets of steel" out of the following: "Steel railway bars and railway bars made in part of steel, weighing more than 25 pounds to the yard, and slabs and billets of steel, \$11 per ton." The reason given for this amendment was that the railroad bar is the advanced product of the billets and that the Ways and Means Committee did not think it proper to fix the same rate of duty on slabs and billets as fixed upon the more advanced product—namely, the railroad bar. Upon inquiry emanating from Mr. Bayne, of Pennsylvania, the Ways and Means Committee stated that slabs will remain as at present, 45 per cent. Mr. Bayne called attention to the fact that the equivalent of this 45 per cent. ad valorem rate of duty is about \$8 per ton. He urged that the duty is too low and that there ought to be some disposition to rectify the error made and put steel slabs at the proper rate. He called

provided for, 1 cent per pound." Mr. Breckinridge, of Arkansas, a member of the committee, offered the following amendment: "Iron or steel, flat, with longitudinal ribs, for the manufacture of fences, $\frac{1}{8}$ cent per pound." In reply to the question of J. Buchanan, of New Jersey, whether the paragraph in question does not in effect propose a change of duty on one class of rods, advancing the rate on those rods which are between $\frac{1}{8}$ inch in diameter and No. 5 wire gauge, from $\frac{1}{8}$ cent to 1 cent a pound, Mr. Breckinridge replied that the committee did not believe that the bill has that effect. He stated that the words of the present law are not changed, and it continues to stand: "Iron or steel rivet, screw, rail and fence-wire rods, round, in coils or loops, not lighter than No. 5 wire gauge, valued at $\frac{3}{4}$ cents or less per pound, $\frac{1}{8}$ cent per pound." Mr. Buchanan urged that the item proposed would be held to embrace all sizes below $\frac{1}{8}$ inch in diameter, and was answered again by Mr. Breckinridge that they did not understand them in that way, that the item enumerated is not in the bill, and consequently remains unchanged as in the present law. The amendment making the rate of duty on "flat iron or steel, with longitudinal ribs, $\frac{1}{8}$ cent per pound" was then accepted. Passing to the sheet-iron clause, Mr. McKinley's amendment to strike out the paragraph was rejected without debate.

The hoop iron clause was then taken up, and the discussion naturally drifted to cotton ties, which, however, is to be taken up in another paragraph of the bill. Mr. McKinley's amendment to strike out the entire paragraph was lost. The item "cut tacks, brads or sprigs, 35 per cent. ad valorem" was taken up, the existing law providing as follows: "Cut tacks, brads, or sprigs, not exceeding 16 ounces to the 1000, $2\frac{1}{2}$ cents per 1000; exceeding 16 ounces to the 1000, 3 cents per pound." Attention was called to the fact that for the first time thus far in the metal schedule the committee has changed a specific to an ad valorem rate of duty. Mr. Breckinridge stated that not having a guide or a record of any statistics which would give the equivalent of a fair ad valorem rate, the committee had to give up entirely trying to find a specific rate, and upon this particular item to fix the ad valorem rate established by the bill, which is the ad valorem specific of the different items. This led to an extended debate on the merits of ad valorem and specific duties. The discussion appears to have ended without any vote on the pending item.

"Iron or steel railway fish-plates or splice-bars, $\frac{1}{8}$ cent per pound" was the next item taken up, to which an amendment was offered making the rate 1 cent per pound, Mr. Buchanan urging that since bar iron was made $\frac{1}{8}$ cent a pound it would be only fair to the maker of fish-plates to place the duty at a rate more in proportion with that of the raw material.

On Saturday, July 7, the tariff was again taken up, the proposal to raise the duty on fish plates to 1 cent per pound being rejected. Mr. Bayne moved to strike out the paragraph making the duty on "wrought iron or steel spikes, nuts and washers, and horse, mule or ox shoes $1\frac{1}{2}$ cents per pound," on the ground that the reduction of the surplus is not likely to be facilitated to any great extent by embodying the item in the bill. The amendment was rejected, and the House passed to the item "iron or steel rivets, bolts, with or without threads or nuts, or bolt blanks, and finished hinges or hinge blanks, $1\frac{1}{2}$ cents per pound." Mr. Buchanan offered as an amendment the insertion of a new paragraph, reading: "Iron or steel rivet, screw, nail and fence wire rods, round, in coils and loops, not lighter than No. 5 wire gauge, valued at $\frac{3}{4}$ cents or less per

pound, 1 cent per pound." He said this amendment was offered in order to make two provisions in reference to iron rods harmonize. The sizes of iron rods between No. 5 wire gauge and $\frac{1}{8}$ inch in diameter are put in one part of the law at one rate of duty and in another part at another rate. In the Mills bill but one of these provisions is copied, and in that provision there is a rate fixed of 1 cent per pound. The amendment, however, was rejected, as was also the motion to strike out the following paragraphs:

"Horseshoe nails, hob-nails and wire nails, and all other wrought iron or steel nails, not specially enumerated or provided for, $2\frac{1}{2}$ cents per pound."

"Boiler-tubes, or other tubes, or flues, or stays of wrought iron or steel, $1\frac{1}{2}$ cents per pound."

The Mills bill fixes "files, file-blanks, rasps and floats of all cuts and kinds, 35 per cent. ad valorem," for which Mr. Farquhar, of New York, moved to substitute the following: "Files, file-blanks, rasps and floats of all cuts and kinds, 4 inches in length and under, 35 cents per dozen; over 4 inches in length and under 9 inches, 75 cents per dozen; 9 inches in length and under 14 inches, $\$1.50$ per dozen; 14 inches in length and over, $\$2.50$ per dozen." Mr. Farquhar submitted a letter by Mr. W. T. Nicholson, manager of the Nicholson File Works, of Providence, R. I., in which that expert called attention to the fact that when he entered the business in 1865 the English list price on the coarser class of goods was $\$7$ per dozen. He began selling at $\$7$, 10 per cent. off. To-day he states that he sells the same goods for $\$2.30$ per dozen, the market price being $\$7$, 70 per cent. off, or $\$2.10$. The substitution of ad valorem for a specific duty, as proposed in this file item, was made the subject of a prolonged discussion. Mr. H. J. Spooner, of Rhode Island, reviewing the duty on files, alluded to the fact that labor is an important interest concerned in its manufacture. This he illustrated by the recital of facts which he stated to have from unquestionable authority. "A pound of steel, from which the finest grades of these files are made, costs 40 cents, and when made into files its value is enhanced to $\$59.35$, an increase of 14,740 per cent. The great cost of this manufacture is in the labor employed, and it is principally for the protection of that labor that such protective duties as existing law provides are required. Upon 1 pound of steel used in the manufacture of medium grades of files, costing 38 cents, the value is increased by manufacture into such files to $\$18.20$, an increase of 4690 per cent.; and in the coarser grades of files a pound of steel costing 6 cents is enhanced in value by manufacture 1640 per cent." Mr. Farquhar's amendment was rejected, the House passing to the next clause relating to "iron or steel beams, girders, joists, angles, channels, car-track channels, T columns and posts, or parts or sections of columns and posts, deck and bulb beams and building forms, together with all other structural shapes of iron or steel, $\frac{1}{8}$ cent per pound." Mr. J. D. Long, of Massachusetts, secured consent at this point to read a letter written by Loring & Parks, Cobb & Drew and the Plymouth Mills, all of Plymouth, on the tack duty. We quote from it the following: "Iron tack plate costs English tack manufacturers from $1\frac{1}{4}$ to $1\frac{1}{2}$ cents a pound. Ours costs us 2 cents a pound, or about 33 $\frac{1}{3}$ per cent. more. English tack manufacturers pay their tack-makers 1s. 3d., or say 31 cents per 100,000, while we pay 50, 60 and 75 cents per 100,000. For the same quality and grade of work we pay 100 per cent. for cutting. If the duty is reduced to 35 per cent. ad valorem we must reduce the wages of our help at least 33 $\frac{1}{3}$ per cent. to compete."

Referring to the item on "beams and structural iron," Mr. Buchanan, of New Jersey, read from a letter from an officer of the New Jersey Steel and Iron Company, in which the proposed duty was denounced as an outrage. Attention was called to the fact that while common bar iron is placed at $\frac{1}{8}$ cent a pound, the rate proposed on structural iron difficult to roll is only $\frac{1}{8}$ cent. Mr. Mills claimed that even at the reduction proposed the duty was equivalent to 49 per cent., and pressing a vote secured a rejection of the amendment to strike out the paragraph in question. A similar fate was met by the clause relating to "steel wheels, tires and tire-blanks."

The proposed item relating to wood screws, placing them at 35 per cent. ad valorem, was struck out with the consent of the Ways and Means Committee.

The House then drifted into a long discussion of the duty on lead in argentiferous ores, and finally took up the item of "needles for knitting and sewing machines, 20 per cent. ad valorem." A motion to substitute 35 per cent. for the 20 proposed under the bill was rejected, in spite of the statements contained in a letter written by Mr. George H. Bleloch, of Springfield, Mass., from which quotations were read.

The proposed 35 per cent. ad valorem rate of duty on "pen-knives, pocket-knives of all kinds and razors," was struck out at the suggestion of Mr. Mills, but the proposal to substitute 10 cents per gross for the 35 per cent. ad valorem rate was defeated.

Our Fortifications.—The scope of the Fortification bill, to be reported to the House by the Appropriations Committee, is for an expenditure of $\$36,000,000$. It provides for experiments with iron guns of 10, 12, 14, 16, 18 and 20 inch caliber; converted guns, multicharge and wire-bound guns, for mortars 12 inches in caliber, steel, cast iron, muzzle and breech-loading. The Secretary of War, Secretary of the Navy, Chief of Ordnance of the Army and Navy and several civilian experts are to constitute the board, who can enter into a contract for furnishing any of the guns that pass the test and are deemed fit to use in either branch of the service. The appropriation is to be continued indefinitely and not to be covered into the Treasury. If contractors, after the expiration of the time specified, fail to deliver the guns, they are to pay to the Government 6 per cent. interest on the contract price. If the guns are furnished before the specified time, the contractors are to receive 6 per cent. for their prompt service. The details of the bill cover 64 printed pages, and the probability is that it will not be considered at this session.

The Longest Tangent in the World.—The new Argentine-Pacific Railroad, from Buenos Ayres to the foot of the Andes, has on it what is probably the longest tangent in the world. This is 340 km. (211 miles) without a curve. It is also a remarkable fact that in this distance there is not a single bridge and no opening larger than an ordinary culvert. The level nature of the country will be appreciated from the statement of the further fact that on the 340 km. there is no cut greater than 1 m. in depth and no fill of a height exceeding 1 m. The country, in fact, seems to be almost an ideal one for railroad construction. There are some drawbacks, however, one being that there is almost an entire absence of wood on the plain across which the western end of the road is located. This has led to the extensive use of metallic ties, which will be used on nearly the entire road. Work has already been begun on the mountain section of the road, which is to cross the Andes and unite with the Chilean line.

THE WEEK.

Immigration at this port during the 12 months ended June 30 was larger than ever before, excepting the years 1881, 1882 and 1883. The total was 550,000 persons, which is 60,000 in excess of the previous year, and there are no signs of a decrease in the future.

The exact amount paid thus far for work and materials on the new City Hall in Philadelphia is \$12,025,332.31.

The French Chamber of Deputies has approved the provision of the Factory bill which makes it incumbent upon employers to give their operatives one day's rest weekly. "Fearing to appear too clerical," the Chamber refused to specify that this day should be Sunday.

The population of Utah is now about 200,000. Of this number about 55,000 are Gentiles. The Mormons follow agriculture mainly as a means of livelihood, while the Gentiles are largely engaged in mining, trade and the practice of the professions. The Territory is 325 miles in length by 300 miles in breadth, and it consists of a succession of rugged mountains holding in their arms fertile valleys, some of great extent. The assessed valuation of the Territory, not including the mines, is about \$35,000,000, and of this amount the Mormons own about 60 per cent., the Gentiles 30 per cent., and the remainder is the property of railroads. Of the resources of the country Judge Powers, of Salt Lake City, speaks with enthusiasm. He says: "We have pure alabaster, fine Carrara marble, magnificent granite, elegant brown stone and white sand stone right at our doors. We have 100 square miles of coal fields, mountains of copper and more mountains of iron. We have great beds of sulphur that range in purity from 45 to 99 per cent. We have two saltpeter mines, the only ones in North America; lakes of borax, wells of petroleum and mines of rock salt. In addition we can manufacture pure salt for \$1.50 per ton from the Great Salt Lake. Salt Lake City has a population of 35,000."

The new bill for the protection of New York harbor, which has become a law by the President's signature and goes into effect at once, provides that the President shall designate an officer of the United States Navy as supervisor of the harbor. It shall be his duty to define the exact limits within which deposits of refuse may be made and to grant permits for that purpose. Discharging or depositing matter of any kind in New York harbor or adjacent waters without a permit from this officer, or otherwise than as sanctioned by him, is declared a misdemeanor, and all persons implicated in such an offense are subject to fine of from \$250 to \$2500 and imprisonment of from 30 days to one year. The penalties imposed by the act are made applicable to all officers of tugs, scows or other vessels aiding in unlawful dumping into the harbor, to persons who employ others to make disposition of refuse and to all directly or indirectly concerned. The supervisor of the harbor is made responsible for the enforcement of the law, and is empowered to spend \$30,000 in carrying it out by the employment of patrol boats and by such other means as he sees fit.

Four river thieves who have successfully followed their profession for some months past at the wharves of the Ocean Steam Navigation Company, were captured while at work in the hold of a vessel abstracting cotton from the bales. They were detected at night by special officers disguised as longshoremen. On a table in the captain's cabin was a well-made steel bar with a split end, made to fit beneath the closely

knitted iron bands which inclose the cotton in a bale. The clamps on the hoops were turned, two layers of cotton extracted, the bales rehooped and stamped upon until the partially released contents filled up the space. Thousands of bales of cotton had been treated in this way, and the proceeds were divided equally between six conspirators. The cotton once removed cannot be identified, and its sale cannot be accepted as evidence of guilt.

Notice was served on the Iowa Railroad commissioners by an order from Justice Miller for them to appear in the United States Circuit Court at a hearing in chancery before him in August 6. It is expected that at the time named application will be made to Justice Miller for a permanent injunction restraining the commissioners from putting into force the new schedule of rates.

The Minneapolis Chamber of Commerce protests against the enforcement of any rule prohibiting railroads from charging less on through shipments for export than for delivery at the seaboard.

The Brotherhood of Locomotive Engineers observe the 25th anniversary of their organization in Detroit, August 17th, and 5000 engineers are expected to participate, from all parts of the United States and the Dominion of Canada.

One of the largest cargoes of iron ore ever received from a foreign port was discharged at Port Richmond last week for the Bethlehem Iron Company. It comprised 3650 tons, and was from the mines at Santiago de Cuba.

The Southern Pacific Company contemplate the construction of a \$2,000,000 bridge over the Carguinez Straits, which will greatly facilitate the conduct of its business. Engineer Thomas, of the Chicago Bridge Company, and J. S. Santher are making investigations to determine the feasibility of the project. The bridge will enable the Southern Pacific to save considerable time and expense in the operation of its Sacramento division.

The railroad companies in the vicinity of New York are preparing for the opening of the Arthur Kill bridge to Staten Island. The Pennsylvania Railway Company have completed a new ferry-house for their Staten Island ferry. The New Jersey Central Company are preparing to build a dock alongside that of the Pennsylvania. The Bayonne and Jersey City Railroad, which connects with the New Jersey Junction Railroad, an extension of the New York Central and West Shore Railways, ends on the Kill von Kull a half mile below the Jersey Central's dock. The Baltimore and Ohio's connection will be completed by the middle of September.

Consul Griffin, at Sydney, New South Wales, in a report on Australian wool and wool growing, says: "There is at present every appearance of a larger wool trade than for the previous year. While the colonial wool product increased between the years 1872 and 1887 from 743,000 to 1,444,000 bales, the amount realized increased only from \$95,820,000 to \$98,300,000. It is estimated that to realize the same amount of money the colonies must now grow 80 per cent. more wool than 15 years ago. The shipments of wool to the United States from Melbourne for the season of 1887-88 amounted to 19,909 bales, compared to 15,360 for 1886-87, and 20,161 for 1885-86. It has been observed that from 1879 to 1887 River Plate and colonial wool increased from 1,500,000 to 2,000,000 bales, or an increase of 500,000; while from 1877 to 1887 the supplies of Australasian, South African, River Plate and United States wool increased from 2,000,000 to 2,700,000 bales, or an increase of 700,000. Yet we find that the con-

sumption has kept pace with the supply. New South Wales alone increased the number of her sheep during the year just closed fully 8,000,000, and the lowest estimate of the increase in the whole of the whole group that I have seen is 12,000,000."

According to the new Domesday Book of England, about two-thirds of the land of England and Wales is held by 10,207 owners, of whom 16 proprietors outside of London were returned in 1873 as either holding more than 50,000 acres, or having estimated rentals of over \$500,000 a year. They were:

	Acres.	Rental.
Duke of Northumberland.....	181,616	\$809,370
Duke of Devonshire.....	126,904	638,165
Sir W. W. Wynn.....	87,526	214,410
Duke of Cleveland.....	81,441	308,220
Earl of Carlisle.....	75,540	248,005
Duke of Bedford.....	74,996	638,265
Earl of Lonsdale.....	67,457	349,795
Earl of Powis.....	60,531	313,470
Duke of Rutland.....	57,082	354,990
Earl of Derby.....	56,471	815,975
Earl of Yarborough.....	55,272	381,190
Lord Leconfield.....	54,615	259,700
Marquis of Ailesbury.....	53,362	290,150
Earl Cawdor.....	51,517	174,935
Sir Lawrence Palk.....	10,109	546,375
Sir J. W. Ramsden.....	8,589	838,005

This table is for England and Wales alone, and it leaves out the Duke of Westminster as being a great landed proprietor of London. The number of owners of land in Great Britain and Ireland, exclusive of London, was officially returned in 1876 as:

	Less than one acre.	More than one acre.	Total.
England and Wales.....	708,289	269,547	977,836
Scotland.....	113,005	19,225	132,230
Ireland.....	36,114	32,614	68,728
Total.....	852,408	321,386	1,173,794

The total number of acres accounted for in the returns is 72,119,882. In England and Wales 874 owners held 9,367,031 acres, or more than one-fourth of the country. Less than 4 per cent. of the population of Scotland, about 5 per cent. in England, and less than 2 per cent. in Ireland, have a share in the ownership of the soil.

Seattle, in Washington Territory, on Puget Sound, is fast filling up with population, most of whom are lumbermen or miners. A good saw-mill hand can command \$4 a day and board. All kinds of permanent business pays just now, and lots fully two miles in the forest are valued at \$500. Enterprising capitalists have driven piles around whole blocks a half mile out in the sound, expecting it to be filled in for building purposes. Seattle claims to have 18,000 inhabitants.

The Italian immigrants in New York City are suffering from destitution, many of them being without employment. The excessive number of arrivals this year is accounted for by the General Manager of the Italian Emigration Society, who says: "Last year 43,725 Italian emigrants landed here. Many of them got work at good wages, and the evidence of their success was presented to those left at home in the tangible shape of cash remittances or in their return to Italy for their families. These facts were taken advantage of by conscienceless scoundrels to encourage an altogether false idea of the conditions of labor here. They stimulated emigration to a most injurious extent. Having fired a poor peasant's mind with visions of a land where work was abundant for all and pay large, they would advance him a passage ticket worth 115 francs and take for it a mortgage upon all his little possessions for 250 francs. They were simply swindlers who cared nothing what became of their victims here so long as they got all that they had in Italy. In this way Italian emigration has been forced up until already by July 1 no less than 38,155 of that class of emigrants had arrived here

this year. Of these nearly all were peasants. There were a few artisans, but probably 90 per cent. at least were agriculturists and common laborers, accustomed to earn from 25 to 40 cents a day in Italy, and to whom the promise of \$1 a day here seemed magnificent."

The value of silks imported at New York during the first half of the year 1888 is \$1,955,202, as compared with \$1,800,000 for the corresponding period in 1884. The imports of silk piece goods steadily diminish year by year, despite the increase of population, while manufacturers of combined silk and cotton fully make up this deficiency.

The Senate Judiciary Committee in Congress responded to the resolution of Mr. Stewart directing them to ascertain whether under the Tariff Act of 1883 lead ore is exempt from duty if it contains gold or silver less in quantity but greater in value than the value of the lead in the ore. The committee express the opinion that under such circumstances lead ore should be exempt from duty, since the silver and gold which predominate are admitted free. A letter from Assistant-Secretary Maynard, taking a similar view, accompanies the report.

Respecting American ware in Austria, United States Consul Jonas, at Prague, says: "This consulate frequently receives inquiries from American commercial and trading firms, as well as manufacturers, touching exports to and imports from the United States, and concerning articles of American origin which could possibly find a market in this country. Different articles sold in this market under an American label and believed by the purchasers to be of genuine American origin, are really nothing but cheap German and British imitations. It may safely be said that numerous articles of our American hardware, mechanics' tools, farming implements and family utensils would find a market in this country if they could be introduced and brought to the notice of the public."

The present condition of the new Croton Aqueduct and the future of the water supply in New York City are subjects incidentally touched upon by General Newton, Commissioner of Public Works, in his testimony before Senator Fassett's investigating committee. General Newton thought the tunnel would be completed in a few months. He estimated the cost of the work at about \$16,000,000. The General said that he expected that the city would be supplied with water as soon as the tunnel was completed, but qualified that statement later by saying that the supply would benefit the citizens as soon as the reservoirs are completed, which he thinks will be in about five years. There will be an abundance of water in five or six years. One reservoir will hold about 9,000,000,000 gallons. The construction of these reservoirs and the dam was opposed by citizens, and therefore the work was greatly delayed. The question whether the Quaker Bridge dam should be a straight dam or a curve had been submitted to three distinguished engineers. Until a decision had been arrived at by them it might be said there would be no plans in existence. He thought \$6,000,000 would cover the expense of the structure. The dam could be constructed safely in six years.

W. H. Vanderbilt's new library building on Thirteenth street, near Eighth avenue, was last week informally presented to the Jackson Square Branch of the New York Free Circulating Library. The building is three stories high and cost \$40,000. The style is Dutch, with a gable. The material of the front is dull red brick with stone and terra-cotta trimmings. The first floor is occupied by the reception-room and

book-cases. On the second floor is the reading-room. The finish of this room is imitation antique oak. A Dutch clock and open fireplace make it homelike. On the third floor the librarian in charge. There are 6000 volumes already on the shelves. Any person of good character, over 12 years of age, will be free to the reading-room or to take away books for a week. There are four libraries of the kind now in the city—the Jackson Square, the Bond Street, the Ottendorfer, on Second avenue, and the Bruce, on West Forty-second street.

The rubber trust has petered out, owing to the unwillingness of a large rubber manufacturer in New Jersey to enter the combination. In January last the rubber manufacturers of New England got together and determined to combine their properties in a trust, which should operate all the rubber shoe concerns in the country. The idea was generally popular, with the exception noted. The Jerseyman finally, in order that the disastrous competition that has been going on for several years should cease, agreed to enter into a combination on prices which should in no way interfere with the individual holdings of the various concerns. It since turns out that the price agreement is in all respects as satisfactory as could have been expected under a trust system, and so far this year at least is likely to remain in force.

Second Assistant Postmaster General Knott has had prepared for the Cincinnati Exposition an artistic chart, illustrative of the development of the postal service in the United States since the establishment of the Government. The carrying service on June 30, 1888, is given as follows:

	Number of routes.	Length of routes, miles.	Number of miles traveled last year.
Railroad service....	1,987	148,007	185,815,082
Steamboat service..	125	10,590	3,162,808
Mail messenger service.....	5,915	4,602	10,632,148
Special office service	2,630	16,709	3,476,213
Star service.....	14,247	226,122	82,322,420
Totals.....	24,904	406,030	284,908,671

The number of miles traveled is over 11,000 times the circumference of the globe. During the last two years the number of railroad routes has been increased by 285, steamboat routes by 9 and Star routes by 1002. The number of miles of railroad service has been increased by 19,074, and the whole number of miles traveled in all branches of the service by 26,120,606.

The New York City Division of the Brotherhood of Locomotive Engineers have voted to assess themselves \$5 each per month, for the benefit of the strikers on the Burlington system.

Commissioner Stephenson, of the State Board of Emigration, who has just returned from a trip West, says there is room enough in America for all the emigrants who may come to our shores. In this respect his opinion has suddenly changed. At the Duluth coal and ore docks men receive 50 cents per hour, or \$5 per day, while farm hands in Dakota get \$2 a day and board, the farmers complaining that they cannot get help enough to get in the wheat harvest.

The Mexican Central freight depot at Paso del Norte was burned a few days ago, entailing a loss of \$500,000. Seventy-two cars were destroyed, 20 of them loaded with mining machinery and valuable merchandise.

Neither General Master Workman Powderly nor President Gompers of the National Federation of Trades is a candidate for the office of Commissioner of Labor. In labor circles it is thought the President will appoint Carroll D. Wright.

MANUFACTURING.

Iron and Steel.

The employees of the Beaver Falls Iron Company, of Beaver Falls, Pa., are on a strike. On receiving their pay recently some of the workers found that their wages had been computed at the rate of \$9.60 per ton, instead of \$10.40, as paid heretofore. The men refused to accept the reduction and stopped work. About 150 men were thrown out of employment.

The Sergeant Mfg. Company, capital stock, \$25,000, have been chartered by B. E. Sergeant, George S. Sergeant and William T. Sergeant, to operate an iron foundry now erected at Greensboro, S. C.

Wm. Swindell & Bros., engineers and contractors, of Pittsburgh, have received a contract from the Passaic Rolling Mill Company, of Paterson, N. J., for three of their improved Siemens regenerative furnaces—one for the bar mill, one for the guide mill, and a double puddling furnace; also a block of four of their improved gas producers and a brick gas flue, 6 feet in diameter, 200 feet long, to carry gas to nine regenerative puddling furnaces and three regenerative heating furnaces.

M. V. Smith, metallurgical engineer, of Pittsburgh, has received an order for a set of drawings and specifications for his improved artificial gas producer, to be sent to Mons. Lucien Arbel, of Rive-de-Gier, France.

Joshua Lancaster, president of the furnace company at Talladega, arrived in that place during the past week from his home at Port Madac, England. A large force of hands is now pushing the work on the company's two furnaces, which are expected to be in operation by the close of summer.

Work on the furnace at Riverside, belonging to the Montgomery Chemical and Furnace Company, is to be resumed. Over \$70,000 has already been expended on this plant. The Louisville and Nashville Railroad Company have offered to buy an interest in this furnace and the furnace people now have the matter under advisement.

Furnace prospectors have been visiting Jacksonville and Crow Plains recently in the interests of new plants at both of these places, and as they are in the center of the finest car-wheel iron region of the State there is every reason for believing that at no distant day companies will be organized and furnaces built in both towns.

The Westerman Iron Rolling Mills, situated on the Fifteen Mile Creek, a mile from Lockport Depot, N. Y., were destroyed by fire 3d inst. The fire caught in the roof from the high chimney about noon, and in 15 minutes the entire mill was burned out so that nothing but the rafters remained. The warehouse to the right was burned, as was also the bridge crossing the creek. The mills were a complete loss, and the fire throws 75 men out of employment. The loss is placed by the firm, composed of George Westerman, Sr., and Calvin G. Suthiff, at \$50,000. There is an insurance of \$8500. In 1881, this same month, the mill was burned in the same manner. The firm state that they will rebuild and be running in 60 days.

The work of enlargement at the car works of the United States Rolling Stock Company, at Anniston, Ala., is progressing steadily. The annex to the machine shop and that to the main building are both completed. In the rolling mill three new furnaces are being erected, and three new hammers are being prepared for their position. Work will begin shortly on the new building proposed, which will be quite an

extensive one, 1500 feet long and 105 feet wide. This building will be used for a wood-working shop, and the machinery for the interior will be propelled by a 500 horse-power engine.

The Sheffield and Birmingham Coal, Iron and Railway Company, of Sheffield, Ala., placed their second furnace in blast a few days ago. The stove works at Sheffield, which were recently put into operation, are now turning out some fine goods, the manufacturers alleging that the iron from the furnaces at that place is the best they ever saw for the manufacture of toves.

Thompson C. Gill & Co., Philadelphia, who purchased the contents of the sheet mills of the Bay State Iron Company, South Boston, have finished dismantling this portion of the plant. They also purchased the puddle mill belonging to the same concern, and they are now at work getting the machinery ready for sale.

It is claimed that the rolling mills now being erected at Jasper, Ala., will be the largest and best equipped in the State.

No. 2 Furnace, of the Coplay Iron Company, Limited, at Coplay, Pa., which has been undergoing repairs for some time, was put in blast last week.

Macungie Furnace, of the Macungie Iron Company, at Macungie, Pa., was blown out on Wednesday, the 27th ult., for the purpose of relining and repairs.

The plant of the Stony Creek Rolling Mill Company, Limited, at Stony Creek, Pa., which has been idle for several weeks, has gone into operation again.

The firm of Hussey, Howe & Co., Limited, steel manufacturers at Pittsburgh, will shortly be dissolved, and an incorporated organization effected. J. W. Brown, who is now secretary and treasurer of the company, will probably be made chairman of the new organization.

The Western Steel Company, of St. Louis, will, it is now definitely known, turn the Vulcan Steel Works over to their owners upon the expiration of their lease. Notice has already been given by the Western company to stop deliveries of coal on a contract calling for 210 tons a day, and not expiring until September 15th next. There is considerable talk, however, of the works being restarted by another company; two different schemes having that object in view are said to be on foot.—*Age of Steel.*

The blast furnace of the Bellaire Nail Works, of Bellaire, Ohio, produced 4350 tons of No. 1 Bessemer pig iron during last month.

For several months past the Glendon Iron Company, Easton, Pa., have been making brick from hot cinders that come from the furnace; recently the wages of the brick-makers were reduced and all of them quit work. The company notified all of their ore contractors in Williams township to stop delivering ore at the works on the 30th inst. It is thought that this means that the company have poor prospects of putting their four idle furnaces in blast.

During the month of June the blast furnace of the Belmont Nail Company, at Wheeling, W. Va., produced 3300 tons of Bessemer pig iron.

The Gogebic Furnace Company, who operated the furnace at Iron River, Mich., in 1887 and part of 1888, has blown out the furnace and given up the lease to the owners, the Iron River Furnace Company, of Fond du Lac, Wis.

The plant of the Columbia Iron and Steel Company, at Uniontown, Pa., is closed down in all departments. These

works have heretofore been operated independent of the Amalgamated Association, although paying the scale of wages demanded by that organization. Last week a committee representing the employees presented the Amalgamated scale to the firm for their signature, and, upon the refusal of the firm to sign the scale, the works were at once closed down. The proprietors state that they are in no hurry to resume operations, as their orders are about all filled and they desire to make some improvements and repairs. From present appearances it will be some time before operations are resumed.

The Scottdale Iron and Steel Company, Limited, at Scottdale, Pa., have signed the Amalgamated scale and the works are now in full operation, giving employment to about 300 men.

The Pittsburgh Steel Casting Company, of Pittsburgh, have recently signed a contract to furnish some heavy castings for the cruiser Maine, now being built by the Government at the Brooklyn Navy Yard. Among the pieces to be cast is the stern-post, which is of such an unusual shape that an examination of the pattern by the railroad officials was necessary before a safe shipment of the casting could be guaranteed. The total cost of the work will be about \$70,000.

The Lukens Rolling Mills, Coatesville, Pa., Chas. Huston & Sons, proprietors, have just put in a new set of three-high rolls, 98 x 30, in place of 84 x 25, as heretofore. They also put a new cylinder of increased size, with Corliss valve gear, to their engine, which was formerly of the slide-valve pattern. All the work is now complete and running satisfactorily. Orders are reported plenty.

In our issue of the 28th ult. we stated that Brown, Bonnell & Co., of Youngstown, Ohio, had issued a notice that upon the resumption of work after repairs all employees not members of the Amalgamated Association would be requested to accept a 10 per cent. reduction. This was an error, the notice in question reading as follows: "In accordance with the receiver's agreement to give notice of any proposed change in wages of tonnage working, notice is hereby given that a reduction in that class of wages will be asked for to take effect on the resumption of work after July 1."

Machinery.

At the annual meeting of the Swinerton Locomotive Driving-Wheel Company, held in Portland, Me., recently, the following officers were elected: Directors, Charles E. Swinerton, J. F. Merrow, Jeremiah Prescott, N. W. Rice, Boston; Frank Jones, Portsmouth; George Burnham, Jr., Portland; George P. Westcott, Portland; J. S. Ricker, Deering; J. Hopkins Smith, New York. President, Charles E. Swinerton. Clerk and treasurer, J. Hopkins Smith.

The Kansas City Foundry and Machine Company, who lately bought out the King Novelty Mfg. Company, of Independence, Mo., have now fully organized, with capital stock \$40,000 paid up; T. B. Ray, president; T. C. Bradley, vice-president and treasurer. They are now building a new brick foundry and machine shop at Manchester, a suburb of Kansas City, and expect to be in active operation by August 1st.

A special dispatch from Altoona, Pa., under date of the 6th inst., reads as follows: "For some time past rumors have been afloat in this city that the Pennsylvania Railroad Company contemplate erecting a number of new shops here. The report has been confirmed, and in a short time work will be commenced. The improvements will consist of a brick paint-

shop 135 feet wide by 480 feet long, with transfer pit. The building will be L-shape, having a capacity for 48 cars and giving employment to about 200 men. A new cabinet shop, 250 x 160 feet, will also be built. The new shops will be erected at Seventh street and Chestnut avenue. A new round-house for the use of the middle division will be built at Fourth street and Eighth avenue. This will relieve the round-house at Twelfth street, which will be converted into a workshop. The statement is made that \$285,000 has been appropriated to meet the expense assumed in the erection of various buildings. A new brick warehouse to cover two squares on Eleventh avenue will also be erected in a short time.

The Midway Machine Works have gotten snugly fixed into their new quarters in South Anniston. The cupola is going up for the foundry and will be ready in a week or so. The brass-foundry room is 50 x 70 feet. The pattern shops are located in the second story and are 30 x 100 feet in dimensions. The company make all of their patterns and do all of their own woodwork. The erecting shop is 50 x 30 feet in size. The company are just finishing a locomotive for the Hidalgo Railway Company, of Mexico.

The Secretary of State of Illinois has licensed the incorporation of the St. Louis Deadlock Brake Company, at East St. Louis, the same to have a capital stock of \$25,000. The incorporators of the company are Nathaniel T. Lane, James V. S. Barrett and A. W. Taussig.

The Kings County Boiler works, formerly of Kent avenue, Brooklyn, N. Y., have removed to the corner of West and Noble streets, same city, being now located in what was formerly known as Greenpoint. The new works, which cover about an acre of ground, are within a block of the river front, which enables them to bid successfully on steamboat jobs. C. F. Davenport is secretary of the company.

The Kilby Mfg. Company are the new corporation who have bought the property, good-will and business of the Prospect Machine and Engine Company, of Cleveland, and of Barney & Kilby, of Sandusky, Ohio. They have made extensive additions to the shops and machinery, and are prepared to do all kinds of heavy foundry and machinist work, besides building the Cummer Automatic and Newert Automatic engines.

The Phoenix Iron Works, Meadville, Pa., engine and boiler builders, use natural gas for steam making; also for blacksmith furnace and for their core oven.

Hardware.

The Freeman Wire Company, of St. Louis, hope to start up the Illinois Wire Mill, which they recently purchased, early in July. In addition to sizes adapted to barb wire manufacture, the company will make other sizes for which there is a local demand, hitherto cared for by outside manufacturers. A very considerable portion of the product will be used in the company's barb wire plant, which immediately adjoins the mill.

P. & F. Corbin, New Britain, Conn., are reported to be building an addition to their factory.

The Universal Horseshoe Machine Company, at a recent meeting, increased their capital stock from \$175,000 to \$300,000. Their buildings at Anniston have been erected, and it will not be long before they will begin operations. They are preparing to make steel blooms themselves in the event of Anniston-Bloomary finding it impossible to keep them fully supplied with the raw material out of which their product is made.

The Iron Age

New York, Thursday, July 12, 1888.

The Blast Furnaces on July 1.

The unfavorable conditions affecting the iron trade have had a further effect on the current pig iron production, the coke furnaces notably showing a falling off, in spite of the fact that Alabama has increased and is still adding to her capacity by blowing in new plants. The status of the anthracite furnaces was as follows:

Anthracite Furnaces in Blast July 1.

Location of furnaces.	Total number of stacks.	Number in blast.	Capacity per week.	Number out of blast.	Capacity per week.
New York.....	28	10	2,844	18	4,124
New Jersey.....	15	4	1,354	11	3,498
Spiegel.....	3	2	179	1	67
Pennsylvania:

January 1.....	118	38,206
December 1, 1887.....	122	39,487
November 1.....	124	40,028
October 1.....	123	39,440
September 1.....	125	38,338
August 1.....	129	37,930
July 1.....	138	40,742
June 1.....	138	44,188

In New York Charlotte went out on the 15th ult. to reline, an operation which it is expected will be finished in the beginning of September. Kirkland is about to resume, if in fact it is not already blowing as we go to press. In New Jersey Chester is banked, leaving only Franklin, Oxford, Secaucus and Warren at work, all the others being idle. The New Jersey Zinc Company are running one stack, and the Passaic one, on spiegeleisen. In the Lehigh Valley Bethlehem has six in blast, Crane four, Glendon only one, and the Thomas Company ten. The latter company has been doing excellent work of late, the weekly output being over 3500 tons. The one furnace of the Allentown Rolling Mill Company, which was blown out for repairs some time since, is now nearly ready to resume. Then the one now running, which is about worn out, will go out, and will probably remain idle during the balance of the year, unless an improvement in the demand warrants starting up. Macungie is now idle, and it is not the intention to make repairs until indications of a better trade are manifest.

In the Schuylkill Valley both the Merion and the Elizabeth are idle and Mount

Laurel went out of blast for repairs on the 1st inst. Swede resumed operations during June. In the Upper Susquehanna Marshall went out in the middle of last month for repairs which will take four months. If the market is favorable the plant will be put in operation then. In the Lower Susquehanna Valley one of the Chickies furnaces is idle for repairs and Katherine, too, is out, to resume on about the 1st of August. No. 1 Paxton, which has been ready to blow in for a long time, remains cold, and it is doubtful even whether No. 2, now producing, will long go on running at present prices. In the Lebanon Valley Robeson resumed on the 28th ult.

We give below the status of the coke furnaces:

Bituminous and Coke Furnaces in Blast July 1.

September 1.....	145	83,124
August 1.....	113	62,061
July 1.....	98	47,319

In New York only one of the Troy furnaces is now running. In the Shenango Valley there have been no changes during June, the same being true of the Juniata and Conemaugh districts and the Youghiogheny. Among those grouped as miscellaneous we may note that Centre Furnace is repairing, and is expected to begin work again early in August.

In the Pittsburgh district furnace D of the Edgar Thomson plant was blown in on June 30, so that all the nine furnaces of Carnegie Bros. & Co. are now at work, this firm making now more than one-half of the iron produced in Allegheny County. Edith Furnace stopped on the 16th ult. for relining, and Isabella No. 1 went out for a similar reason, to resume probably during the current month.

In Virginia Gem is likely to remain inactive until the company is reorganized. Lynchburg expects to have repairs completed by the 1st of August, and Pulaski

started in again on the 27th ult. after an idleness of less than a month. The new furnace of the Virginia Nail and Iron Works made its first cast in June. In West Virginia Belmont is now the only stack in operation, both Riverside and Top Mill furnaces being out of blast for relining.

In the Mahoning Valley Falcon was banked on the 21st ult. and Phoenix on the 26th. Anna is to blow in during the current month, after being thoroughly repaired, and Mary is also likely to resume early in August. Among the stacks of Central and Northern Ohio the noteworthy changes are the blowing out of Dover, Franklin and Zanesville. The latter was temporarily banked on the 16th ult., and later on stopped to clean out the stoves. It is to resume in two weeks. Steubenville Furnace, on the other hand, resumed during June. Belaire has already attained the record of making over 80,000 tons of pig iron on one lining, and is expected to run a year longer on it. In the Hocking Valley Crafts has just completed a new hearth and bosh, but it will only light up when prices warrant it. Gore went out on the 23d. ult. In Illinois South Chicago is running only one stack. In Missouri Jupiter went out on the 28th ult., and the only furnace of the Western Steel Company now active is expected to stop about the middle of this month. This will leave only one coke stack at work in the State. In Wisconsin the remodeled Mayville, formerly a charcoal stack, started on coke on the 28th ult.

In Alabama No. 1 Eureka resumed on the 25th, and No. 2 on the 29th ult., both having been banked since the 21st of May on account of a shortage of coke. One of the Sloss furnaces was blown in early in July. One of the new De Bardeleben furnaces, at Bessemer, made its first cast on the 13th ult., and one of the new Sheffield and Birmingham Company's stacks blew in during the month, the second following early this month. Two Ensley furnaces are now at work. Gadsden is expected to begin blowing in the middle of August. In Tennessee South Pittsburgh has two stacks out of three in operation.

The status of the charcoal furnaces was as follows:

Charcoal Furnaces in Blast July 1.

Location of furnaces.	Total number of furnaces.	Number in blast.	Capacity per week.	Number out of blast.	Capacity per week.
New England.....	14	5	410	9	680

June 1.....	177	63	10,972	114	10,499

Among the charcoal iron enterprises we may note the following: In New England

Kent is still idle; the repairs being made are expected to be completed in September. In Virginia Beverly, Cedar Run, Foster's Falls, Reed Island and Speedwell are producing iron. In the Hanging Rock region Jefferson and Madison have blown in. In Michigan Deer Lake resumed in June, while Spring Lake stopped for repairs on June 25, with the expectation of blowing in again early in August. In Wisconsin Hinkle is out, but will soon start again. Minneapolis Furnace made 8510 tons during the first six months, in spite of constant shortage of charcoal. Otherwise the furnace would have exceeded the nominal capacity and would have come up to 65 to 70 tons a day. The Minneapolis iron is now being used alone in car-wheels, with reported satisfactory results. In Missouri Sligo is again running. In Tennessee Cumberland Furnace blew out on the 1st ult., and will not run again until railroad transportation is secured, which, it is hoped, can be obtained within a year. In Alabama Rock Run is to go out in August for 30 to 60 days to make repairs. The furnace had a 14 months' blast on one hearth. Both Shelby, both Woodstock, Tecumseh and Gadsden are producing.

Irontale Furnace, of the Puget Sound Iron Company, is to go into blast between the 15th and 20th of July, after thorough repairs, the erection of charcoal kilns, &c. It is expected that the furnace will make 40 tons of charcoal iron per day. The Oregon Iron and Steel Company, of Oswego, Ore., are building a new furnace, which will blow in early in August. It is 60 x 13, with three Whitwell stoves.

Little significance attaches to the statements of furnace capacity idle, because they naturally lump together plants so long inactive that under conditions like the present they seem to have little chance of early resumption. Until a furnace is either abandoned or dismantled it is naturally carried along in the lists, although under normal conditions it is not worthy of being considered reserve capacity. It has been thought a matter of interest to segregate these plants from those which are really on the active list, being merely out for repairs or temporarily banked. We have grouped together all the furnaces which have been idle for six months or more to show how large a capacity is practically out of the race when the markets are at or near low level. We have included furnaces held in reserve often practically as "alternate stacks," that is to say, such as are kept in readiness to enable continuous work to be done, the machinery available being only powerful enough to run one furnace.

Analysis of Idle Anthracite Furnaces.

	Out six months or more.		Temporarily idle.	
	Num-ber.	capac-ity.	Num-ber.	capac-ity.
New York.....	12	2,586	4	1,188
New Jersey.....	9	2,781	3	784
Pennsylvania:				
Lehigh Valley.....	15	3,210	6	2,137
Schuylkill Valley....	14	2,314	4	1,344
Lower Susquehanna	9	1,821	3	781
Lebanon Valley.....	1	190	1	350
Upper Susquehanna	8	1,418	2	403
Maryland.....	4	462
Totals.....	72	15,232	23	7,047

It will be seen, therefore, that the furnace capacity which is likely to be made available by a moderate revival is very small indeed, while that part of it which cannot be counted upon to aid in output

unless a heavy advance takes place is relatively large. It may be stated in this connection that the latter is largely nominal since our records do not contain data which would allow us to gauge their possible make from actual output over any extended period.

Similarly the coke furnaces show the following when segregated into two groups:

Analysis of Idle Coke Furnaces.

	Out six months or more.		Idle temporarily.	
	Number.	Capacity.	Number.	Capacity.
New York.....	2	1,900
Pennsylvania:				
Pittsburgh district.....	1	350	3	2,855
Shenango Valley.....	4	2,040	4	2,129
Juniata and Conemaugh..	2	2,452	3	1,068
Yough Valley.....	2	976
Miscellaneous.....	2	945
Maryland.....	2	320
Virginia.....	2	1,431	2	684
West Virginia.....	2	392	3	1,854
Ohio, Central and Northern	4	1,828	6	3,316
Mahoning Valley.....	7	4,007
Hocking Valley.....	6	1,259	4	809
Hanging Rock.....	1	300	1	123
Illinois.....	4	2,088	4	5,806
Missouri.....	5	1,985	1	755
Wisconsin.....	2	1,176
Michigan and Indiana.....	2	490
Alabama.....	2	880	2	1,084
Tennessee.....	1	540
Total.....	46	19,784	45	25,067

It will be noted that in the case of the coke furnaces the available reserve is a far heavier proportion of the total capacity idle.

The Advance in Tin.

The statistics for the month of May were a disappointment to holders of tin and speculators for a rise, so much so that the metal was left to its own fate during the first three weeks of June, dropping all the way to £76. 5/. On June 1 the visible supply in Europe and America was 23,516 tons, as compared with 20,194 on May 1, showing an increase of 3322 tons where a decrease was expected. On July 1 the figures had radically changed, the visible supply being 20,403 tons, or 3113 tons less than the month before. On July 1, 1887, it was 16,092, and on July 1, 1886, 10,871. The deliveries more particularly attracted attention, being no less than 4268 tons in England and Holland in June, against 1999 in June last year and 1835 in June, 1886.

We perceive from our Continental exchanges that on or about June 24, when tin was at its lowest in London, the general opinion prevailed that the syndicate, after having accomplished its object of helping to depress the market, was about to come to the rescue of the downtrodden metal, a thing which has since taken place, the syndicate still being the heaviest holders, owning, it is asserted, some 16,000 tons. Considering that prior to the boom last year tin ranged in London during a twelvemonth between £90 and £100, and was not looked upon as too dear for ordinary purposes of consumption, it was evident that it must be cheap at £76. 5/, provided there was no fear that the syndicate would soon come to grief. Added to the cheapness there was the fact that, at the Straits at least, the low price was beginning to curtail production, and people in the tin trade at Singapore and Penang, especially the large Chinese traders, were thinking well of the metal and its im-

mediate future. After the tumble the Chinese were free buyers at the low prices then prevailing at Penang, and remained purchasers to ten times the amount bought for Europe and America. Besides what they bought they shipped to China their speculative holdings since the beginning of the year. While so low tin received more support from the Chinese firms in the Straits than from Europeans and Americans outside of the syndicate, and in this they have displayed their usual foresight as merchants.

The rebound, when it came, carried tin £10 higher in about a week in London, and 2 cents in New York, although it has since again receded to some extent. London predictions per cable that the syndicate is about to collapse are heeded very little on this side, because we are fully aware that they are dictated on the one hand by ill will and on the other by interested motives. Although none but the copper companies on this side are admirers of the syndicate, we are far from believing that its downfall is near at hand. We, therefore, hold that the present reaction in favor of tin is from every point of view legitimate, and likely to remain so, unless prices are again driven to extremes, as they were in January, February and March.

The Chicago *Tribune* selected the 4th of July for the publication of a very erroneous article on the condition of the steel trade of that locality. The article would have attracted little attention if it had appeared in an obscure paper, but the *Tribune* has such a high standing and circulates so widely that any statement appearing in its columns seems naturally to be at once stamped as authentic. In this article several truths are stated, but they are buried in a mass of misstatements so completely that columns would be required to correct all the false impressions conveyed. A few of the most important errors, however, ought to be pointed out. The Chicago steel men are not all going ahead and making money. The past two months and this month they have been able to run somewhat steadily through the accumulation of a number of small orders for rails for summer delivery, but they are not, as stated, "turning out more rails" this year than last. One steel rail mill is not making any rails at all and has not done so for months, but it ran all last year. The other mills have also fallen far short of last year's production up to this time. The article says that the mills "are now able to turn out steel rails at least \$5 cheaper than they could last year, consequently at \$32 per ton this year they are making just as much as they were last year at \$37." The grounds upon which this statement is made are not given, and it is rather seriously doubted, for reasons which it is unnecessary to lay before our readers who are familiar with the cost of manufacturing iron and steel. The details of quantity of material used in manufacturing a ton of steel rails are altogether wrong, but they show that the writer has been somewhat diligent in the use of such information on the subject as he could get ready made, and which he supposed gave him all that was needed. It is very distracting to Chicago manufacturers and business men, who are anxious to have their daily papers pay more attention to the business and in-

dustrial topics, to find these questions treated with such gross misunderstanding when they are taken up.

Six Months' Pig Iron Production.

We present below an estimate of the pig iron production in the United States for the first six months of the current year, based upon full, but not complete, returns. However, nearly every large producer in the United States favors us with official returns, the figures in a number of districts being the aggregates of the product of every maker, large or small.

As will be seen, the output of anthracite pig fell off heavily, a result partly due to the coal strike, but more largely to the decline in prices.

Production of Anthracite Pig Iron, Gross Tons.

	First half 1887.	Second half 1887.	First half 1888.
New York.....	103,800	90,472	77,166
New Jersey.....	95,408	58,658	46,244
Pennsylvania:			
Lehigh Valley...	384,070	311,411	250,191
Schuylkill Valley...	231,490	233,125	153,584
Upper Susquehanna Valley...	80,010	67,388	70,963
Lower Susquehanna Valley...	220,583	244,933	96,461
Lebanon Valley...			147,860
Maryland.....	7,355	9,188	776
Total.....	1,072,718	1,015,125	843,275

The figures for 1887 are the returns of the American Iron and Steel Association. It should be stated, however, that our grouping is somewhat different. We set aside the Lebanon Valley, including in it three furnaces which Mr. James M. Swank classifies with the Schuylkill Valley.

Our returns for the coke furnaces show the following:

Production of Bituminous Coal and Coke Pig, Gross tons.

	First half 1887.	Second half 1887.	First half 1888.
Pennsylvania:			
Pittsburgh district.....	333,820	468,030	321,525
Shenango Valley.....	157,952	207,318	184,373

Miscellaneous.....			20,841
Total Pennsylvania.....	691,329	867,263	697,312
New York.....	6,562	40,309	12,711
Southern States:			
Maryland.....	2,232	893	
Virginia.....	70,926	77,519	82,069
Georgia.....	21,441	15,208	20,859
Alabama.....	63,770	92,002	121,087
Tennessee.....	90,658	91,291	86,290
Kentucky.....	21,623	10,257	19,468
West Virginia.....	29,071	44,421	42,528
Total Southern States.....	320,021	332,191	372,310
Ohio:			
Hanging Rock.....	57,723	55,211	54,023
Mahoning Valley.....	150,784	174,427	186,548
Hocking Valley.....	30,979	24,667	41,423
Central and Northern.....	164,866	195,812	189,297
Total Ohio.....	404,342	450,117	471,290
Indiana.....	7,776	4,019	7,229
Illinois.....	224,255	271,685	262,967
Wisconsin.....	37,844	38,928	19,482
Missouri.....	39,976	47,428	46,991
Colorado.....	11,753	10,828	11,000
Grand total....	1,743,670	2,063,796	1,901,281

The heavy outputs early in the year to a large extent will compensate for the decline in the later months, the total falling-off as compared with the second half of 1887 being only 162,000 tons. The South has gained—our figures, however, not being as complete as is desirable for Alabama. Pennsylvania has fallen off—the

Pittsburgh district chiefly, on account of the stoppage at the Edgar Thomson works. Ohio gained a little, while Illinois fell off a trifle.

Production of Charcoal Pig, Gross Tons.

	First half 1887.	Second half 1887.	First half 1888.
New England.....	17,882	16,378	13,680
New York.....	12,858	10,973	8,798
Pennsylvania.....	3,667	6,966	5,373
Maryland.....	5,704	8,094	3,851
Virginia.....	2,084	6,358	2,035
North Carolina.....	1,250	2,000	1,200
Alabama.....	49,842	42,078	39,130
Tennessee.....	15,804	25,267	27,768
Kentucky.....	622	4,915	1,344
Texas.....	1,719	2,191	2,991
Ohio.....	5,157	11,400	8,459
Michigan.....	85,219	105,426	99,731
Wisconsin.....	19,993	22,438	20,466
Missouri.....	9,937	16,448	10,999
Washington Ter.....	1,416
Total.....	235,354	281,032	239,615

There has, therefore, been quite a notable falling off in the production of charcoal iron.

Summarizing the whole, the make of pig iron for the last six months was 2,984,177 gross tons.

Terms of Payment on Pig Iron.

A Consensus of Opinion.

Lately considerable difference of opinion has developed in one of the leading iron markets of the country over the two questions stated below. In order to ascertain how far these differences of opinion extended, and what is the practice in different sections of the country, we addressed a letter of inquiry to the leading pig iron merchants throughout the country, whose replies we append. The questions under discussion were:

1. Does four months' time on pig iron mean from date of shipment or date of receipt of the iron?
 2. If cash discount is taken, is it taken from the date of the furnace shipment or from the date of the receipt of the metal?
- Grouping the replies by the leading markets we have:

NEW YORK.

Warren, Wood & Co.: We understand four months' time on pig iron means four months from the time the iron arrives at the agreed point of delivery. If sold at a stated price at furnace, to date from shipment. If sold delivered on buyer's dock, to date from delivery on buyer's dock. With regard to cash discount the same rule applies—i. e., to discount from the time delivery is made as contracted, either at furnace or on buyer's dock.

Hugh W. Adams & Co.: To your first question we answer, four months' time on pig iron means to date as per terms of contract; sometimes from date of shipment from furnace; sometimes from date of shipment from tidewater, and sometimes from date of receipt of the iron at consumers' works. To your second question we answer, a cash discount would also depend upon the terms of the contract, as stated above in regard to time.

PHILADELPHIA.

L. & R. Wister & Co.: In reply to your first question we would say that the usual custom is to sell the iron delivered to works. We consider the date of the receipt of the iron the commencement of the time sold on. Second, there is very little iron sold in the Eastern market subject to a cash discount, and the receipt of the iron is the basis of settlement.

Another leading Philadelphia firm writes: The answer to the questions you ask depends entirely under on the standing with

parties. If nothing is said about extra time, four months would be from date of shipment if made f.o.b. cars, or if sold delivered from time of receipt by consignee. Mostly 30 days are taken without interest and three months' interest added, unless sold at four months flat, when note would be dated as stated above. The same rule applies to cash payment, whether iron is sold at furnace or delivered. As a general rule customers take the date of receipt as the date for payments.

Justice Cox, Jr., & Co.: An answer to your first question, "Does four months' time on pig iron mean from date of shipment or date of receipt of the iron?" depends very much upon where the iron is shipped from. If from the South, when it takes from ten days to two weeks to arrive at its destination, notes are always dated from the reception of the iron. If it comes from near-by places notes are always dated from the date of the bill, which is always the date of shipment from the furnace. To your second question, "If cash discount is taken, is it taken from the date of the furnace shipment or from the date of the receipt of the metal?" the same rule would answer this as in reference to notes. This is our experience, and we think is the general rule.

J. Tatnall Lea & Co.: In our opinion four months' time on pig iron dates from time of shipment from furnace, if the iron is sold delivered at furnace, or if sold delivered at buyers' works, the time granted, whatever its duration might be, would naturally date from time of its receipt by buyer. This has been our universal experience in the matter referred to, and we have never even heard the question raised. As for cash accounts, they would, of course, be governed by the same rule and date from delivery of metal at agreed point of delivery, at furnace or at buyer's works, as the case might be, but we think where cash discount is contemplated it is most frequently a matter of specific agreement between seller and buyer and is not left to be determined by the application of any general rule or custom.

BALTIMORE.

R. C. Hoffmann & Co.: In both cases it would depend on the terms of sale as to delivery. If the terms be delivery at furnace, or place where the iron is at time of sale, then the note should be from date of sale or shipment, and in case of discount the same. If sold to be delivered at any point other than furnace, or where the iron is when sold, the date in both cases would be the date of receipt of the goods at that point by purchaser. We have known of cases when iron was sold, delivered at furnace, and not moved by purchasers for many months.

J. L. Hogan & Co. say: Pig iron sold on four months' time should be paid for in four months from date of invoice, which should correspond with date of shipment. Should buyers desire to pay prompt cash, and thus avail themselves of discount, the full number of days should be allowed from date of invoice. It may be necessary to qualify the above statement to some extent. For instance, the question might be brought up whether the material was purchased upon a price f.o.b. at furnace or delivered to buyer. If the latter, we have known instances in which the date of arrival was assumed as the basis of settlement. Again, unusual delays sometimes occur in transit, and here again buyers occasionally make claims for consideration. Such cases, we consider, must be settled on their individual merits, without reference to the broad principle as stated above.

BOSTON.

C. L. Pierson & Co.: When pig iron is sold for delivery f.o.b. furnace at shipping port, then four months should be

from date of such delivery. If the iron is sold for delivery at place of consumption or other designated distant point, then four months should be from time of arrival at such designated point, and the same rule should be applied to cash discounts.

CLEVELAND

A leading firm writes: "It is our custom to have the four months' time on pig iron date from the time of shipment from the furnace. Very frequently, however, bright purchasers insist on this being dated from the time of receipt of the iron, in which event we do not care to oppose them. However, we might say that our universal custom is to have it dated from the date of shipment from the furnace. The cash discount is treated in the same way.

Condit, Fuller & Co.: Our understanding of the point referred to is, four months' note from date of shipment from the furnace, or if cash discount is taken it is from the date of shipment, also from the furnace. We invariably require settlements in this way, although frequently customers will try to take advantage of the fact that sales are made f.o.b. at point of delivery, and construe this to mean that settlements are to date from such delivery. We invariably insist on settlements being made from date of shipment, and understand that delivery affects price and not the settlement.

A prominent firm writes: It has become almost a universal custom among sellers of Western irons to make prices delivered at the consumer's city; therefore we take it that four months' time or cash discount should be figured from the date of the arrival of the iron rather than from the date of shipment from the furnace.

CINCINNATI.

Bacon, Floto & Co.: When sales are made on time for delivery at a given point the terms date from delivery at that point, unless specially stipulated to the contrary. In order to secure terms to date from time of shipment sales should be made f.o.b. cars at furnaces, or specially stipulated if price is made away from furnace. Cash discounts will always have to be in accord with the terms of sale. In this market the usual discount is from 40 to 50 cents per ton on four months' sales, remittances to be made within 30 days of receipt or shipment, as the case may be. Prompt cash discounts are specially stipulated. The above are the present usages of this market. We have understood some agencies contending that when they make sales at points of deliveries they make it their rule to date paper from time of shipments; unless this was agreed upon mutually we think it could not be enforced.

Another Cincinnati house holds the following views: Four months' time on pig iron means four months from date of shipment, unless otherwise specified in contract. If cash discount is taken, if at specified rate per cent. per annum, it is right to calculate from date of shipment. If at specified amount per ton, discount must be taken advantage of within 15 days from date of shipment, except in cases where buyer is too far from furnace to receive the iron in 15 days from date of shipment; then 20 days may be allowed. To avoid any misunderstanding between buyer and seller we think the sale memorandums or contracts should distinctly state when papers should date and how cash discount settlement should be made, and we endeavor to cover all these points in our contracts.

PITTSBURGH.

A. H. Childs.: In this market settlements by note for pig iron sold on four months' time are understood to date from the average delivery of the metal to the buyer. If a cash discount is taken on a

sale based on four months' price it usually means 2 per cent. off the face of the bills, which may be rendered for any part of the total amount sold or after all has been delivered, just as may have been agreed upon beforehand.

Collord & McKeefrey: Four months' time on pig iron, in our judgment, means from date of shipment of the iron. Our customers usually make settlements on this basis. Cash discounts should be taken from date of the receipt of the iron.

Nimick & Co.: Unless otherwise agreed in the terms of sale, four months' time on pig iron dates from the receipt of the iron, and cash discount is taken from the date of the receipt of the metal.

CHICAGO.

Pickands, Brown & Co.: On time sales we have three methods—viz.: Four months from date of shipment from furnace or agreed point of shipment. Four months from arrival of the cars at point of delivery. Four months from delivery in the yard or at the works of the buyer. Each method is settled at the time of sale. On cash sales we have two methods—viz.: Sharp cash, which is immediately on arrival at point of destination. Cash 30 days, which is cash within 30 days of arrival at destination. In both cases a delivery at point of destination is made before payment is due unless specially agreed to contrary at the time of sale.

H. R. Durkee & Co.: Replying to your inquiry as to how our customers interpret the expression "terms four months," would say that the general practice in our trade is to regard it as meaning "freight cash; balance four months from date of delivery at place of delivery." Invoices are made out at date of shipment and sent customers as notices of shipment. When the iron is sold f.o.b. at furnaces then the date of the settlement paper coincides with the date of the invoice. When sold f.o.b. at the place of consumption, the paper is dated the day the iron arrives there. When customers buy a round lot of iron, scattered deliveries, receiving a certain number of cars per month, they usually make the paper in one piece for each month's deliveries, and date it at an average date of delivery for the month; the intention being to come as near as possible to paying for the iron four months from the date of delivery, at the place where in the contract of purchase it was agreed to be delivered.

Charles Himrod & Co.: If sold on four months' time, for delivery on cars at the furnace, the four months should begin the day it is shipped; if sold on same terms, delivered at the purchaser's place of business, the time should begin from the date of such delivery. If sold for cash, we consider it monthly settlements; all iron shipped during one month being paid for from the 10th to the 20th of the succeeding month.

The Andrews Brothers Company: We have been asked to give you our views on the terms of pig iron sales. We find some buyers here and elsewhere who insist on four months from arrival of car at destination, and say they get it and refuse to settle otherwise. To avoid any dispute over such a matter we make our quotations read about as follows: "Terms—all freights paid by consignee. Metal, four months' note or acceptance from day of shipment. Cash discount of 50 cents per gross ton on prompt receipt of metal at destination." We find a few buyers who claim that the cash discount can be taken any time in 30 days, but the great bulk of our settlements are made as per our terms given above.

Mrs. David Thomas, the widow of David Thomas, who succeeded in utilizing anthracite as a blast furnace fuel, died on the 9th inst., at the age of 94 years.

THE PIPE TRADE.

Manufacturers' Views of the Situation.

For many months the wrought-iron pipe trade has been in an exceptionally depressed condition. The causes of this deplorable state of affairs are touched upon by the writers of the following communications, who, as manufacturers, have closely watched developments.

A prominent Eastern manufacturer presents the following views:

The demand for consumption is good, and there are many quite extensive orders in the market. We think a larger quantity of iron pipe is being used than usual. The position of the wrought-iron pipe trade is simply that of overproduction. You ask, "To what extent the decline in raw material compensated the lowering of prices." Prices first fell, and the price of raw material followed the decline. Prices, of course, fell faster than raw material, but the difference has not been great. A large business can be done in wrought-iron pipe if present prices could be accepted, but such a business would net a decided loss. You might ask the percentage of loss, which would be difficult to give, as it would vary greatly with the economy with which business was conducted, but, we think, in no case can a loss be prevented at this time. In the year 1886 there was a period of six or eight months that the wrought-iron pipe trade showed a good profit. There is so much capital now lying idle in our country, the holders of which are very keen to employ profitably, that these few months of profit suggested the erection of a number of new mills, located in different parts of the country, mostly in the central valleys and gas districts. These mills have been completed within the past year; some of them are working, and all are in working order. All are anxious to sell their production, and the consequence is an overproduction and glut in the market. Had no new mills been built since the summer of 1885 those in operation at that time would now be transacting a reasonably profitable business, and the production from them would be more than ample to supply our home trade, with a margin for export. If all the mills at present going continue in operation, the rule, "the survival of the fittest" would sooner or later compel some to stop. The other chance for an improvement is to patiently wait until the population of the country grows up to the present capacity of the mills to manufacture pipe. The tariff has nothing whatever to do with the depression in the wrought-iron trade; it is simply overproduction, first, of wrought-iron pipe, and, secondly, of merchandise.

A second Eastern producer states his ideas on the subject:

We believe that the present depression in the iron trade took its origin from the date of the President's unwise tariff proclamation, followed up by the labor strikes, a very severe winter, late spring, and a continuation of the tariff agitation. Prices at this time are running at and below the cost of production. In our opinion, nothing is wanted to bring on a change for the better, except confidence based upon the settlement of the tariff question. It is the suspense created by the agitation of the tariff question that does all the mischief. The Mills bill or any other moderate bill would not hurt the country seriously for 30 days after it was enacted into a law. This country could even stand free trade, though we believe it would bring about a deplorable condition of the toiling millions of this country, that would be deprecated by every honest man in the land.

One of the largest works of the country takes the following position:

Concerning a comparison of the decline in raw material to the decline in the price of pipe, I would state that since January, 1887, the price of small and large pipe has declined, respectively, about 20 per cent. and 25 per cent., while the price of the iron to make these two classes of pipe has declined, respectively, about 10 per cent. and 15 per cent. The price of labor has declined from 6 per cent. to 15 per cent., according to locality. Manufacturers in the East have been able to obtain a larger consideration and co-operation from their workmen than those in the West have. About Pittsburgh the reduction in labor has not averaged over 7½ per cent. The consumption has fallen off notably in natural gas line pipe and natural gas distribution pipe. The dealers throughout the country, owing to the falling market, have bought only from hand to mouth, and the large orders usually placed by this

class of trade in the spring and early summer have not been forthcoming. The stocks, therefore, in the hands of dealers are not as great as they usually are, and, while I look upon the state of affairs as extremely distressing to a manufacturer, still I do not see anything in them to indicate a panic, unless the tariff tinkering or a reduction in the tariff, should increase the timidity on the part of all classes of buyers. Owing to this tinkering, and owing to the depressed and falling market, dealers have held off. Enterprises which were planned have been procrastinated, because every week the enterprise could be floated for 5 per cent. less money than they could the week before. This has retarded many gas plants, water-works plants, and, I believe, a good deal of building. Another thing must be borne in mind. Before the natural gas boom, which created such a demand for wrought-iron pipe, the entire business of this country was being taken care of by seven or eight active mills. There are now about 22 on the list, and, notwithstanding this large increase in number, many of the older ones largely increased their capacity. It is safe to say that there is 30 per cent. surplus pipe machinery in the United States. During the past six months there have been three failures of pipe mills, owing to loss of money, and there have been seven or eight mills shut down, owing to the inability to compete. Only those whose facilities and geographical location, and some, I am sorry to say, who are forced to run for financial reasons, are now in operation.

A Western maker writes ;

There is more real downright cussedness in the pipe business than in any line that we know of. If Congress would enact a law indicating the standard weight of pipe for use for steam, water or gas, so that when buyers receive stuff 10 to 20 per cent. light they could sue the mill producing and recover a proper rebate, it would go a long way toward preventing such foolish cutting of prices as we now see, as to-day, there being no legal standard, each mill does pretty much as it sees fit, and where necessary, in order to save themselves from loss, will cut the weight, as indicated above. Scrupulous manufacturers will not do so, and are consequently driven out of business until the market takes a turn upward again. Raw material has been reduced, say, \$2 per ton, as against a reduction of, say, \$14 per ton on 1-inch pipe (other sizes will figure about the same). The large demand a year ago was from natural gas companies. This has nearly ceased, and there is no prospect of recovery for some time to come. We know of no movement on foot to better the condition, and, from past experience, should take no stock in any offered.

From another prominent manufacturer we have the following :

The causes of the depressed condition of the pipe trade are well known to every manufacturer of the goods. No practical plan looking to a speedy improvement in the situation has, however, in our opinion any chance for serious consideration now, as such a plan would demand from each manufacturer sacrifices that some of them could not, we are satisfied, afford to make.

From another manufacturer in Pennsylvania we have the following :

There has been no decline in raw material to compensate for the low price of pipe, except a slight reduction in wages. The consumption has fallen off in gas-line pipes, as at almost all the points in the natural gas regions the pipes have been laid to the consumers' works. Of course to private houses there will be always new ones, but they will be small pipes. Some of the manufacturers of pipe think the business will revive in October, though why it should we cannot tell. There has been no plan proposed to bring about a better condition of the trade, except one—a suspension of production totally or one half until the consumption catches up with the production. The whole trouble with the pipe trade is that there is too much made and the market is glutted, and parties that have large stocks must sell at such prices as they can get in order to keep their mills running full, as, by running full, they can make pipe at a lower price. The reason for all this is that when the oil and afterward the natural gas was discovered it was necessary to convey it by pipes to the consumers and the oil and gas companies all wanted their pipe as soon as possible, and, as the make of these sizes was limited, a great many pipe manufacturers erected new mills for this large pipe, and others added more furnaces and neglected making small pipe, as gas and oil line paid them better. This made some pipe scarce and started up more mills, among which are the Continental Tube Company, Duquesne Tube Company, J. W. Friend & Co. and Pittsburgh Tube Works, all of Pittsburgh; Tyler Tube Company, of Boston; Oil City Tube Company, Oil City;

American Tube Company, of Youngstown; Warren Tube Company, Warren, Pa.; Riverside Iron Works, Wheeling, Va., and Conshohocken Tube Company, Conshohocken, Pa. Also a new mill at Reading, by the Reading Iron Works, costing over \$100,000; Haxtun Steam Heating Company, Kewanee, Ill., thus making 29 mills in the United States, when there were only 17 or 18 before. Some of these are not running at present, as pipe is selling below the cost of making, but should the price increase they would all start up in a few days and of course the price would go down again. The National Tube Works Company are said to turn out over 1000 tons of pipe a day and the Pennsylvania, Pittsburgh Tube Company, Reading, American, Morris Tasker & Co. and Allison each 500 to 1000 tons in the same time. Some of these have the natural gas and own or have an interest in the gas wells and have to pay the same price per day, whether they run or not, as the gas cannot be shut off when they are idle, but must be burned in the open air at the end of a large pipe near their works. Some of the very largest works are financially strong, while some of the others are not, and the strong ones say they will not form a combination and reduce stock, as it will only galvanize the weak ones and start them up, but prefer to freeze them out if possible, then buy them up and destroy them, as they have done before once or twice.

CORRESPONDENCE.

The Chemistry of Foundry Iron.

BETHLEHEM, July 6, 1888.

To the Editor—DEAR SIR : MR. Meissner's interesting and valuable articles on

cerned, was at a perfect standstill. Matters have not changed very much in that respect since then, and it is difficult to see why iron founders do not avail themselves of the aid which chemistry can offer them in selecting intelligently the quality of iron best suited for the purpose desired. The fracture of pig iron is a guide to its quality, no doubt, but a very inferior and untrustworthy one. It is absolutely impossible to judge from the appearance of the fracture either the fluidity or the shrinkage of an iron. A few experts in the foundry trade may be able to judge with some degree of approximation the relative scrap carrying capacity of two irons of the same grade, and possibly also to some extent the comparative softness or "machining" quality of the resulting casting, these properties depending upon the percentage of silicon and carbon, both of which influence the color and texture of the fracture. But even such expert judges find themselves completely at sea when they are called upon to select iron for a certain purpose from brands with which they are not familiar.

The mixtures of ore used, the kind of fuel employed, as well as the temperature and strength of blast are all factors which modify the appearance and quality of the resulting pig iron in a manner that may become very perplexing to those who may depend upon the appearance of the fract-

NO. 1 PIG IRON. NATURAL SIZE.

"The Chemistry of Foundry Iron" are giving impetus to a long and sadly neglected subject. A subject which it would be profitable both to the consumer and producer to investigate. Those versed and engaged in the processes of converting pig iron into ingot metal know and appreciate the value of chemical analyses, and there is no reason why the foundry trade should not be similarly benefited by a thorough knowledge of the chemical constituents of the raw material employed. From 1880 to 1883 the writer was engaged in running a chemical laboratory in a blast furnace town in the Shenango Valley. There were ten furnace stacks in the place, five or six of which were running. So long as several of them were making Bessemer iron the laboratory was kept quite busy, but when, as it sometimes happened, all of them were running on mill or foundry iron, the chemical business, so far as analyzing pig iron was con-

ure as the sole guide. The grain of an iron is an indication, but only in the case of a good No. 1 iron; a reliable indication of the condition of the furnace at the time such iron was produced. A good No. 1 iron is certain evidence that the furnace was in condition, so far as heat and chemical action are concerned, to produce the best grade of foundry iron from the mixture of ores and flux, with the kind of fuel and the temperature of blast active at the time.

No. 2 iron indicates a probability of an inferior condition in the furnace, but does not prove such to be the case, since the grain may have been affected by slow running and excessive dampness in the pig beds.

When No. 3 iron results it is pretty certain that the temperature and perhaps other chemical conditions were insufficient for the production of No. 1 foundry iron, though possibly even in this case exceedingly slow running and very wet pig beds

may have caused a No. 1 iron in the furnace to appear a No. 3 in the pig.

Supposing the latter to be the case, the chemical difference, excepting the relation between the fixed and graphite carbon, would probably be insignificant. If such be true, would the iron be less valuable than if it had been No. 1? Would it carry less scrap? If remelted under the same conditions, would it be likely to be less fluid or have a different shrinkage? Would it be inferior in its physical properties? Careful experiments would undoubtedly prove that the grain of the fracture is not a reliable indication of quality where the grade has been modified by external causes.

The accompanying cut illustrates a piece of pig iron (if iron from a blast furnace that has not been run into a pig mold can be properly so called) in which the crystals have been developed to a degree not often reached.

This iron was produced by the Sharpesville Furnace, which at the time was running on Nos. 1 and 2 Bessemer iron, producing principally the former grade. The lining suddenly becoming damaged the furnace had to be shoveled out. In the bottom was found a flat mass of iron 6 to 8 inches thick, weighing several tons, and of this the piece illustrated is a specimen. It got the benefit of slow cooling to the fullest extent. The crystals are so large and the planes of cleavage so well defined that the mass is comparatively frail. In this specimen we have an illustration of the effect of exceedingly slow cooling.

This very iron, if—instead of cooling in the hearth of the furnace, as it did—it had been run into pig beds under ordinarily favorable circumstances, would probably have resulted in a No. 1 pig. If, however, run slowly into wet beds it might have graded a No. 2 iron, and if cast into chills it would undoubtedly have come out a close grey forge or even mottled or white.

Experience teaches and the experiments of Mr. Meissner and others prove the fact that the grain of an iron can be much improved by paying proper attention to the pig beds and the running of the iron into the same. Since the consumers of foundry iron have established the custom of grading the iron solely by the appearance of its fracture, and are willing to pay a marked difference in the price, it is but natural and quite fair for the producers to strive to develop such marks of quality. That slow cooling improves the appearance of pig iron is an established fact, but that its real quality is thereby enhanced is not so evident. The sow has uniformly an opener grain than the pig, yet it is exceedingly doubtful whether it will make a better casting. The material in and the working condition of the furnace fixes the chemical composition upon which the true quality of the product depends, and this cannot be materially changed between the tapping hole and the pig bed. The loss of carbon due to the segregation of kish is not likely to be appreciable. Kish is a very light and bulky substance—1 or 2 pounds of it floating about will make a big show in the atmosphere of a casting house. Yet 2 pounds would mean a loss of only $\frac{1}{1000}$ of 1 per cent. on a 20-ton cast. The only appreciable chemical change which is effected by the rate of cooling is the change in the relative quantities of combined and graphitic carbon, and since the relation is completely disturbed in the process of remelting it would appear that the importance of graphitic carbon in pig iron is generally much overestimated. Very respectfully,

EDWARD A. UEHLING.

Natural gas stocks have had a sudden break, due to disagreement between iron manufacturers and the gas companies.

Prices of Alloys.

LOCKPORT, N. Y., U. S. A., July 6, 1888.

To the Editor: Referring to quotations from P. W. L. Bierman, of Hanover, Germany, published in your issue July 5, we beg to submit for publication the following table, comparing German prices with those made by this company upon the same alloys. We omit aluminium brass, as Mr. Bierman does not give the composition. The prices we quote on aluminium bronze are subject to liberal discount for quantity orders. Our aluminium bronze is aluminium and pure lake copper. In reducing the measures used by Mr. Bierman to American equivalents we estimate 1 mark = $24\frac{1}{2}$ cents, 1 kg. = $2\frac{1}{2}$ pounds. Very respectfully yours,

DUDLEY BALDWIN, JR.,
Manager The Cowles Electric Smelting and
Aluminum Company.

The Duty on Wire Rods.

To the Editor: In recent issues of your paper have been published arguments presented to the Finance Committee of the Senate opposing any reduction of the duty on wire rods. Although these papers are most carefully and ably written, and one of them is the result of prolonged collaboration of several of the rod-makers, it is noticeable that no statements of the cost of rolling rods or the amount paid for labor appear in either of them. If the continuation of the present duty is necessary to enable the rod-makers to secure profitable returns on their investments and pay their present rate of wages, no argument could be so convincing as a presentation of a copy of their cost sheets and pay rolls. This, however, was carefully avoided. The advocate of a lower rate of duty, however, presented an affidavit made by a gentleman of long though not recent experience in rod rolling, that two years ago the cost of making rods from billets was not over \$7.50 per ton, of which \$3.10 was for labor, and that later improvements had reduced both amounts. This affidavit gave the cost in detail, and Mr. Garrett, inventor of the Garrett train now in general use, admitted its correctness as far as his knowledge extended. On this basis the cost of wire rods, based on quotations of billets in your latest issue (\$28), would be \$35.50 in Pittsburgh, against \$42.50, the price at which foreign rods can be delivered there. Viewed in another light, the cost price of American billets is \$5 per ton greater than foreign billets, if free of duty, could be delivered in Pittsburgh for; the duty on wire rods is about \$11, leaving a net benefit to rod mills by the tariff of about \$6 per ton. The total cost of labor in the process is not over \$3.10, and probably not now over \$2.60 per ton, and yet the rod mills urge an increase of about \$2.50 in the duty, which would give them a bonus of over \$8 per ton on the process of rolling alone. This is more than the entire cost of labor, fuel, interest on investments, &c., and it is about three times as

* According to size of order.

much as the total amount paid by them for wages. With full knowledge of these facts, Mr. Oliver, in behalf of the manufacturers present at the hearing, "earnestly and vigorously protested against anything less as destructive to the industry." He also stated "that the industry had a special claim on the favorable consideration of Congress." In view of the costs herein given it would seem that claim was being earnestly and thoroughly worked. In this communication it is not the writer's purpose to enter into a general discussion of the rate of duty on wire rods, or to attempt to refute all the specious arguments put forth by the advocates of higher duty, but merely to present to you and your readers indisputable facts and figures. Submitting these, let others draw their own conclusions. BARB WIRE.

Traction Increaser.—Craven's traction increaser, which is a drawbar between the locomotive and tender that automatically transfers a portion of the weight of the tender to the driving-wheels of the engine in proportion to the load which the engine is pulling, has lately been tried on the New York, Lake Erie and Western. It was first attached to No. 604, a consolidation engine with 950 pounds less on the rear drivers than on the other pairs. This engine hauled 10 per cent. more than its regular load from Hornellsville to Susquehanna, making running time. Subsequently the drawbar was attached to a 38-ton engine with four-coupled drivers 5 feet diameter, and cylinders 18 x 22. Weight on driving-wheels 48,000 pounds, 2000 pounds dead weight which had been placed on the footboard to increase the adhesion having been removed. This engine took $12\frac{1}{2}$ per cent. above the regular load, and in another case 14 per cent. additional, and made a creditable performance on the round trip between the points before named, on a day when a fine mist was falling during nearly the whole trip, there not being enough rain at any time to wash the rails.

The steel steamship Harlem, built by the Detroit Dry Dock Company, at its Wyandotte yard, for the Western Transit Line, was launched on the 3d inst. The Harlem is an exact counterpart of the Hudson, built last fall for the same line. She is 304 feet over all, 38 feet 6 inches beam and molded 36 feet deep. Her cargo will be 2500 tons on 15 feet of water. The Harlem will be ready for business in two weeks from the time of launching.

At a recent meeting of the Tennessee Coal, Iron and Railroad Company, the scheme proposed by the directors was authorized. Stockholders are being asked to surrender \$1,000,000 of the \$10,000,000 common stock at 30 per cent., subscribing for preferred stock at 90 per cent.

One of the longest tunnels in the world is the one at Schemnitz, Hungary. It has a length of 10.27 miles—1 mile longer than the St. Gothard and $2\frac{1}{2}$ miles more than the Mont Cenis tunnel. When the contract was made, in 1872, the work was let at about \$35 a yard, but for some years before its finish, a little while ago, the cost was about \$110 a yard.

Until recently the island of Corsica was entirely destitute of railroads. On the first of last month, however, the road from Ajaccio to Bastia, begun seven years ago by the Government, was opened for traffic as far as Corte, a distance of 45 miles. By reason of the high grades, numerous rock cuttings to be overcome, its cost has been \$33,250 per mile.

BRAZIL.

PARA. July 6, 1888.—*India Rubber*.—Our market during the week was at first irregular, with an easier tendency but later on rallied and recovered the decline in consequence of unfavorable crop news from the valley of the Amazon. Receipts at this point this month and next are, therefore, expected to be light.—*Per cable direct.*

CHILI.

VALPARAISO, May 11, 1888.—*Copper*.—Since the beginning of the month a decline took place from \$29.50 to \$28.70. At present no Copper is offering for sale except July shipments, and even about effecting any sales of the latter makers are indifferent, the trouble about the scarcity of hands and coal still being the same as before. Sales sum up for the fortnight 10,570 quintals, \$28.70 equaling £72.7/6. *Nitrate*.—A large business has been done, over 1,000,000 quintals changing hands at \$2.67½ @ \$2.80 for 95%, and \$2.80 @ \$2.85, 96 and 1%. Producers are at present less averse to selling futures, September-October delivery bringing as much as \$2.80 for 95%. Refined is scarce, and \$2.90 has been refused. Our Nitrate market is at present above European parity. Sales sum up 1,166,000 quintals; \$2.80 equals 87½¢ pwt. in England.

EAST INDIES.

SINGAPORE, July 3, 1888.—*Tin*.—June shipments to the United States from the Straits Settlements have amounted to 300 tons, as compared with 650 tons during the corresponding period of last year; to England there have been 100 tons, against 1200 tons since January 1. There were shipped to America altogether 850 tons, against 2600 tons, and to England 10,000 tons, against 6600.—*Gillilan, Wood & Co. to Chas. Nordhaus, New York, per cable.*

MANILA, July 3, 1888.—*Hemp*.—Our market during the week has been steady at \$8.50 pwt. against \$7.50 same date last year, equaling \$28. 15/ cost and freight, against \$26. 5/. Clearance for the United States since January 1, 91,000 bales, against 123,000 last year; loading for ditto, 8000, against 6000; cleared for England since January 1, 178,000 bales, against 98,000; loading for ditto, 5000, against 19,000; cleared for all other countries, 42,000, against 20,000; receipts at all ports since last cable, 3000, against 4000; ditto since January 1, 301,000, against 232,000 bales last year and 197,000 in 1886. Freight, \$5.50, against \$5 in 1887. *Exchange*, 3/5½, against 3/5½.—*Ker & Co. to Charles Nordhaus, New York, per cable.*

CALCUTTA, May 26, 1888.—*Jute*.—With the exception of a few localities in the Naraingunge District, where the rainfall was excessive, the new crop is making satisfactory headway. Advices from the large area around Mymensingh are particularly favorable. Old crop Jute is now neglected by exporters, while the Bengal spinners are absorbing the first receipts of new. Prices for the latter improved 3% during the week; the stock is further reduced. Futures are tending upward, and 10,000 bales August-September shipment via canal were taken during the week.—*Times of India.*

PENANG, May 26, 1888.—*Tin*.—Receipts during the fortnight reached 5000 piculs; Europeans meanwhile only bought 500 piculs, but Chinese took 6000. After declining in the beginning from \$34.50 to \$33.90 the market recovered at the close to \$34.75, at which Chinamen have been buying. The latter also took their unsold stock and shipped it to China. There now remain unsold in Bazaar 3000 piculs.—*Schmidt, Kustermann & Co.*

AUSTRALIA.

FREMANTLE, WESTERN AUSTRALIA, May 15, 1888.—*Gold*.—Advices from the placer diggings

in the Kimberley District Gold fields are of the most encouraging kind; a large immigration is pouring in, and vessels are loading for this port at Melbourne, Sydney and Adelaide. The mines are easily accessible from King George's Sound in our immediate vicinity, and from Cambridge Gulf in the North. From the latter the distance to the placers is 200 miles and from here 350 miles.—*Argus.*

RUSSIA.

ST. PETERSBURG, June 25, 1888.—*Petroleum*.—A syndicate of capitalists at Odessa is building at present on the banks of the Danube, at Galatz and Orsova, large stationary tanks in order to ship in flat tank lighters Petroleum direct on the Danube to Austria and Southern Germany. *Steel*.—The Government is about to construct several large works in Southern Russia for the manufacture of Bessemer Steel, the casting of Guns and for extensive machine shops. *Dynamite*.—For the first time the Government has resolved to allow Dynamite to be manufactured in Russia. A concession has been granted a Swedish firm to make it.—*Journal de St. Petersbourg.*

SPAIN.

BILBAO, June 23, 1888.—*Iron Ore*.—Stagnation has been intensified, the normal quotation being 7/6 @ 8/ for Campanil, and 6/10 @ 7/3 Rubios. The total shipments since January 1 amount to 1,827,669 tons, against 2,205,906 last year. *Pig Iron*.—Only coastwise shipments were made to the extent of 1272 tons.

GERMANY.

HAMBURG, June 30, 1888.—*Iron*.—The Rhenish-Westphalian Iron market has been quieter, but none the less firm, as Iron Ore remains steady. Stocks of Pig have increased 5500 tons in May which is not much. May production in Germany and Luxembourg has been 360,855 tons of Pig, against 327,282 last year. There were made 173,535 tons Forge and Spiegel, 35,361 of Bessemer; 108,248 Thomas, and 43,711 Foundry. Since January 1 the production during the first five months has been 1,756,310 tons of Pig, against 1,527,721 during the corresponding period of last year. Spiegel has been less lively latterly, and can now be had for 57 marks, 10 to 12% Manganese. In order to be able to sell Forge Pig, not active at home, for export, it has to be shaded. Foundry Pig has been moderately active and steady. The demand for Thomas has increased perceptibly, production is now correspondingly greater, but it is extremely firm. Bessemer remains neglected. The finished Iron inquiry is slack still; dealers only buy for immediate wants. The structural branch forms an exception, notably as regards Beams; an advance seems to impend therein; it is difficult to procure any for speedy delivery. The associated Rhenish-Westphalian rolling mills received 13,000 tons orders during the past six weeks. There has been no change in Hoops. Something will have to be done to facilitate exportation. Boiler Plate makers are busy steadily; the reverse is the case with Thin Sheets, so that production has to be curtailed. Wire Rods and Wire Goods generally are dull. A satisfactory state of things is reported by foundries, machine shops and car-makers. *Metals*.—All metals have been steadily dealt in in this market and are firm. We quote: German Lead, 12.70 @ 13.20 marks pwt. 50 kg. Lake Copper, 80 @ 81, and Silesian Spelter, 16 @ 18; Zinc Gray, 20 @ 22; ditto White, 21 @ 32, and Tin Salt, 60 @ 85.—*Borsenhalle.*

A Large Terrestrial Globe.—According to *La Nature* an immense terrestrial globe, constructed on the scale of one-millionth, will be shown at the Paris Exhibition of 1889. A place will be set apart for it at the center of the Champ de Mars. The globe will measure nearly 13 m. in diameter, and will give some idea of real dimensions, since the conception of the meaning of a million is not beyond the powers of the human mind. Visitors to the exhibition will see for the first time on this globe the places really occupied by certain known spaces, such as those of great towns. Paris, for instance, will barely cover a

square centimeter. The globe will turn on its axis, and thus represent the movement of rotation of the earth. The scheme was originated by MM. T. Villard and C. Cotard, and *La Nature* says that it has been placed under the patronage of several eminent Frenchmen of science.

Lifts on Canals.

In the course of a paper on canal engineering, read by Mr. L. F. Vernon Harcourt, at the recent Conference on Canals and Inland Navigation, held at the British Society of Arts, London, the author stated that the adoption of hydraulic lifts for connecting two reaches of a canal, where the difference of level is considerable, appears to be growing in favor at the present time. The system is comparatively modern, for though a simple lift, with two counterbalancing troughs, lifted and lowered 8-ton barges a vertical distance of 46 feet on the Grand Western Canal many years ago, it was subsequently abandoned. The first hydraulic lift was erected at Anderton, in 1875, for connecting the river Weaver with the Trent and Mersey canal. The difference of level is 50½ feet; and the barges are raised or lowered in two wrought-iron troughs, 75 x 15½ feet, with 5 feet depth of water, each resting on a central hydraulic ram, 8 feet in diameter, working in two hydraulic presses underground, which can be connected at pleasure, making the troughs counterbalance one another. One trough accordingly ascends as the other descends, the motion being imparted by removing 6 inches of water from the lower trough; and only the final lift of about 4½ feet, required when the descending trough reaches the water in the lift pit, has to be effected by hydraulic power. The whole lift is accomplished in 2½ minutes, and one 100-ton barge can be transferred from the river to the canal, and another from the canal to the river, in eight minutes, with an expenditure of only 6 inches depth of water over the area of one trough, and the power required for the final short lift. A similar lift, on a somewhat larger scale, has recently been opened at Les Fontinettes near St. Omer, on the Neufossé Canal, in place of a flight of five locks, which were inadequate for the traffic. The height of lift is 43 feet, and each trough is 182½ feet by 18½ feet, containing a depth of 6½ feet of water and weighing 700 tons, and accommodates barges of 300 tons. On the Canal du Centre, in Belgium, there is a rise of 220 feet in a distance of only 5 miles, and this is to be surmounted by four hydraulic lifts similar to, but still larger than, the two just described.

In the very useful scientific methods whereby movements record themselves in curves, photography and a point moving on a smoked surface are, perhaps, those forms which yield the most delicate curves. In the French Société d'Encouragement, M. Mascart has called attention to a useful modification by M. Fénon, in which a bent tube of tempered steel forms a syphon dipping at one end in a reservoir of ink and at the other being shaped like a pen point, which is brought near the moving paper (the sloped section outward). Capillary force prevents outflow when the apparatus is at rest. A fine trace is produced by this pen, without interruption by the most rapid displacements and without sticking when at rest. M. Wolf, of the Paris Observatory, has used the system for getting records of air-pressure, temperature, wind, &c., with the best results. The reservoir needs charging only once a week, and, using inks mixed with glycerine, a single charge has been found to suffice for a barometer record of more than six months.

TRADE REPORT.

Philadelphia.

Office of *The Iron Age*, 220 South Fourth St.,
PHILADELPHIA, PA., July 10, 1888.

Pig Iron.—Business has been very dull since the opening of the month, but it could hardly be otherwise, considering the season and other coincident influences. There is not enough doing to determine the exact character of the market, but in the majority of cases it appears that sales cannot be made in quantity without allowing concessions of more or less importance. The consequence is that those controlling favorite brands are feeding them out in small lots at quoted rates, which, with the deliveries on old contracts, keeps the furnaces clear of accumulation. But in other directions the situation is less satisfactory. The supply is in excess of the demand, and buyers for round lots cannot be found, unless at lower figures than have hitherto prevailed. As regards Southern and Western Irons, the outlook is decidedly uncertain. The offerings are constant and liberal, but bids at figures likely to be accepted are both few and far between, so that the indications are that the Iron must be piled up at furnaces or marketed elsewhere. Which of these alternatives will be adopted, or whether a lower range of prices will be accepted, depends upon the adjustment of values in other markets. During the past few days sales of good Western Mill Irons in moderate quantities have been made at from \$15.50 to \$15.75, delivered in Philadelphia or at points near by. At these figures there seems to be a good supply, but nothing to indicate much lower prices, so that these rates are presumably about on a level with what could be realized elsewhere. Some Southern Irons, said to be equal to Pennsylvania No. 3 Mill, have been offered at \$14.50 @ \$15, ex-ship Philadelphia, but were not accepted, and as sales were not urged at lower figures it is supposed that they were about equivalent to what can be obtained at other points. Pennsylvania brands have been sold chiefly at from \$18 to \$18.50 at tide for No. 1 Foundry, \$17 to \$17.50 for No. 2, and \$15 to \$16.50 for Gray Forge, the feeling being steady on desirable brands, but a little unsettled on all others, as the supply seems to be increasing, without any corresponding increase in the demand.

Foreign Iron.—There is no demand, although inquiries for good sized lots have been made. Prices were entirely too high, however, so that nothing is likely to come of it. Asking prices for Bessemer, c.i.f., duty paid, \$19.50 @ \$20, and for 20 % Spiegel, \$26.75 @ \$27.25.

Blooms.—Business has been rather quiet during the past couple of weeks, but there is renewed inquiry for Steel, with bids at from 50¢ to \$1 per ton less than quoted rates, which are about as follows: Domestic Rail Blooms, \$28 @ \$28.50, Slabs and Billets from \$29 to \$35, f.o.b. cars at mill, according to analysis; Charcoal Blooms, \$52 @ \$54; Run-out Anthracite \$42 @ \$44; Scrap Blooms, \$34 @ \$35 per "bloom" ton of 2464 lb. Foreign at tide, c.i.f., duty paid, \$30 @ \$31 for Nail Slabs; \$31.50 @ \$32.50 for 4 x 4 Billets, and \$35 @ \$39 for Siemens-Martin, price according to analysis, &c.

Bar Iron.—The mills in this vicinity are well supplied with orders for two or three weeks to come, and are, therefore, firm in making quotations for new business. There is not much inquiry, however, and most of the business offered is in small lots, prompt delivery, for which full

prices are obtained. Large lots are not wanted unless at very low prices, and even then there is no great urgency to place orders. From present appearances it seems likely that the Pittsburgh mills will soon all be at work, hence the indifference shown by buyers, unless orders are accepted at the very inside figures made some time ago. For this reason transactions have been of a limited character, although at comparatively firm prices, say 1.85¢ @ 1.9¢ for Best Refined Bars, and 1.82¢ for Grooved Skelp, although for good-sized lots buyers stand out for lower figures, varying from \$1 to \$2 per ton, according to the character of order, as to quantity, quality, delivery, &c.

Muck Bars.—There is very little demand, and prices are again slightly easier, although from \$27 to \$27.50, delivered, are the ordinary asking rates. Sales chiefly at the inside figure.

Plate and Tank Iron.—The Plate mills appear to be in better condition than they have been for some time, and are, in most cases, quoting from 2¢ up for Ordinary Plates. But there is not much new business offering, so that it is still an open question whether they can maintain the position they have assumed. Neither would it require much of a demand to put prices a little higher still, so that all depends on developments during the next two or three weeks. Meanwhile quotations are about as follows: Ordinary Plate, 1.95¢ @ 2¢; Tank, 2¢ @ 2.10¢; Shell, 2.4¢ @ 2.5¢; Flange, 3.5¢; Fire-Box, 4¢; Steel Plates, Tank and Ship Plate, 2.3¢ @ 2.4¢; Shell, 2.7¢; Flange, 3¢ @ 3½¢; Fire-Box, 3½¢ @ 4½¢.

Structural Iron.—There is very little new business on the market, and, from present appearances, the demand will not be of much importance until after the election. The mills have some work on hand, however, which, with the current demand for small lots, is expected to keep them fairly well employed for the present. Prices are unchanged and about as follows: 2.05¢ @ 2.10¢ for Bridge Plate; 2¢ @ 2.10¢ for Angles; 2.6¢ @ 2.7¢ for Tees, and 3.8¢ for Beams and Channels, Iron or Steel.

Sheet Iron.—There is a fair demand for Sheets, with rather more than the usual amount of inquiry for large lots, although as yet orders of this class have not been placed to any extent, as buyers are probably waiting to see how things turn out in Pittsburgh. Prices are steady and unchanged, and for small lots are quoted about as follows:

Best Refined, Nos. 26, 27 and 28....	3¼ @ 3½¢
Best Refined, Nos. 18 to 25.....	3 @ 3½¢
Common, ¼¢ less than the above.	
Best Bloom Sheets, Nos. 26 to 28....	4¼ @ 4½¢
Best Bloom Sheets, Nos. 22 to 25....	4 @ 4½¢
Best Bloom Sheets, Nos. 18 to 21....	3½ @ 3¾¢
Blue Annealed.....	2.8 @ 3 ¢
Best Bloom, Galvanized, discount.....	.62½ %
Common, discount.....	.67½ %

Merchant Steel.—Trade is very dull in this department, as is usual at this season of the year. Sales are mostly made in small lots for immediate delivery. Prices are nominally as follows: Tool Steel, 8½¢; Machinery, 2½¢ @ 3¢; Crucible Spring 4½¢; Open-Hearth Ordinary Spring, 2½¢; Crucible Machinery, 5¢; Best Sheet Steel, 10¢; Ordinary do., 8¢.

Old Rails.—The offerings in this market are extremely light, and in most cases are held above the market. One or two lots of T Rails, amounting to nearly 2000 tons, were sold at \$21.75 delivered at mill near Philadelphia, with buyers still on the market at about \$21, Philadelphia, or its equivalent.

Steel Rails.—There is rather more inquiry for Rails, and the feeling is more hopeful than it was a few weeks ago. Sales during the first half of the year are

stated to be about 950,000 tons, with deliveries during the same time of two-thirds that amount. It is estimated that deliveries during the last half of the year will bring up the total to nearly 1,400,000 tons. Sales during the week have been chiefly on the basis of \$30 at mill, which is a firm quotation on the average run of orders.

Scrap Iron.—Dull and neglected, asking prices about as follows: \$19 @ \$20 for cargo lots; \$20 @ \$21 for carload lots, delivered, or for choice \$21.50 @ \$22; No. 2 do., \$14 @ \$15; Turnings, \$18 @ \$14; Old Steel Rails, \$19 @ \$20; Cast Scrap, \$14 @ \$15; do. Borings, \$9 @ \$10; Old Fish Plates, \$24 @ \$25. Old Car-Wheels, \$17 @ \$18, Philadelphia, or its equivalent.

Wrought-Iron Pipe.—There is nothing to note in connection with the Pipe trade. The demand for all sizes is fair, with something of a scarcity in the smaller sizes. Prices do not improve any. Discounts are quoted as follows: Black Butt-Welded, 55 %; on Galvanized do., 45 %; on Black Lap-Welded, 65 %; on Galvanized do., 55 %; on Boiler Tubes 60 %.

Nails.—The demand for Nails is limited, but the usual stoppage of the mills at this period prevents what would otherwise be a considerable accumulation of stock. Price is quoted at \$2, net, for carload lots, although sales are occasionally made at lower figures, but they are usually from mills where product is not familiar to the trade.

Chicago.

Office of *The Iron Age*, 96 and 97 Washington St.,
CHICAGO, July 9, 1888.

Pig Iron.—Some dealers report an increase in mail orders during the week, but otherwise the condition of business is unchanged. Local buyers are bidding lower rates than have yet been made, in the belief that the stoppage of so many rolling mills will make Iron cheaper, but they are not meeting with much success in pushing down prices. The Chicago market is now relatively lower than the other Western trade centers, and sellers are strenuously resisting a further decline, except in Ohio Softeners and Southern Coke Foundry Irons, on which a slight decline is noted. The time is now fast approaching when an important class of heavy consumers will be in the market for a year's supply, and much speculation is being indulged in as to the extent of that trade this season. The production of Lake Superior Charcoal Pig has been heavily curtailed quite recently, and sellers now feel more sanguine of their ability to prevent a further decline. Cash quotations are as follows, f.o.b. Chicago: Lake Superior Charcoal, all numbers, \$19 @ \$19.50; Alabama Car-Wheel, Nos. 1 and 2, \$25.25; do., Nos. 3 to 6, \$26.25; Southern Charcoal Foundry, No. 1, \$18; Jackson County Softeners, No. 1, \$17.50 @ \$18; Hocking Valley, Soft Foundry, No. 1, \$16.50 @ \$17.50; American Scotch (Blackband) No. 1, \$18.50 @ \$19.50; other Ohio Scotch Irons, No. 1, \$17.50 @ \$18; Lake Superior Coke, No. 1, \$17 @ \$17.50; No. 2, \$16 @ \$16.50; No. 3, \$15 @ \$15.50; Southern Coke, No. 2, \$16.75 @ \$17.25; No. 2½ and Open Bright, \$16.50; No. 3, \$15.50; No. 1 Mill, \$14.50 @ \$15.50. Attention is called by buyers to their detection of attempts by parties making very low quotations to ship Iron of an inferior grade to that which was actually contracted for. The responsibility for such a practice lies between the furnace company and their agents, but the furnace company, of course, are the sufferers when the deception becomes apparent and the confidence of buyers is lost.

Bar Iron.—Agricultural implement manufacturers are beginning to place contracts for their year's supply. Some were closed during the past week at about 1.65¢, half extras, delivered. Mill prices for early delivery are irregular, agents for mills now stopped on account of the strike quoting 1.65¢ @ 1.70¢, while others, representing non-union works, name 1.62½¢ @ 1.65¢, half extras, for Common Iron. Store prices have been advanced on account of increased rates asked by the mills, and quotations now range from 1.90¢ to 2¢, according to quantity and quality.

Structural Iron.—Some important orders for city viaducts are expected in the market soon. Prices are stiffer, owing to the stoppage of many mills. Carload lots from mill are now quoted as follows, f.o.b. Chicago: Angles, 2.15¢ Universal Plates, 2.20¢; Tees, 2.45¢; Beams, 3.40¢. Store prices are unchanged at the following rates: Angles, 2.40¢ @ 2.70¢; Tees, 2.60¢ @ 2.90¢; Beams and Channels, 3.80¢.

Plates, Tubes, &c.—A large business was done in Plates during the week, and prices are very firm at the following rates from store: Heavy Sheets, Nos. 10 to 14, 2.65¢; Tank Iron, 2.55¢; Tank Steel, 2.80¢; Shell Iron, 3¢; Shell Steel, 3.25¢; Flange Iron and Steel, 4¢; Fire-Box Steel, 4.75¢ @ 5.75¢; Boiler Rivets, 4¢ @ 4.25¢; Ulster Iron, 3.75¢; Boiler Tubes, 60 % and 10 % off on 2½-inch and larger and 62½ % off on 2-inch and smaller. It is claimed that only small lots of Tubes will be sold at these prices, as cost is not being realized.

Sheet Iron.—Mills in a position to sell for immediate or early delivery are advancing their prices, and now ask 2.95¢ for No. 27 Common, f.o.b. Chicago, some even naming 2.85¢ at mill. Inquiries are being received from buyers who would like to lay in stock if it could be had at the former rates. From store No. 27 is still quoted at 3.30¢.

Galvanized Iron.—Mill agents report a very good demand, which would make this month's sales the heaviest ever known, if it should keep up and stocks would hold out. Small lots are still quoted at 60 % and 5 % off for Juniata, and 60 % and 10 % off for Charcoal.

Merchant Steel.—Store business was very good during the week and a number of mill orders were booked, although the large consumers are not yet in the market for their next season's supply. Store prices are as follows: Bessemer Bars, 2.30¢ @ 2.50¢; Tool Steel, 8¼¢ @ 9¼¢; Specials, 13¢ @ 25¢; Crucible Spring, 4.40¢; Open-Hearth Spring, 2.90¢; Open-Hearth Machinery, 2.75¢ @ 3¢; Crucible Sheet Steel, 7¢ @ 11¢.

Steel Rails.—A moderate demand for small lots has been experienced by the local mills. Large orders are in sight, but they will not be placed until certain financial preliminaries are settled. For small lots, such as are now being booked, prices range from \$32 to \$32.50.

Old Rails and Wheels.—The only sale of Old Iron Rails coming to light was one of 200 tons at \$18.50. Sales of short lengths of Old Steel Rails have been made at \$13.50. A few carloads of old Car-Wheels brought \$18, but \$18.50 has been offered for more without securing them.

Scrap.—Very little is being done in this line at present. A sale of No. 1 Forge is reported at \$18, and small lots of other Scrap have been taken by consumers for immediate use. Mixed Country Scrap is probably worth about \$12, and dealers' selling quotations are about as follows, per ton of 2000 lb: No. 1 Forge, \$17 @ \$18; Track, \$16.50;

No. 1 Mill, \$13; Light Wrought, \$9—Horseshoes, \$16.50; Axles, \$22 @ \$23; Cast Machinery, \$12.50 @ \$13; Stove Plate, \$9.50; Cast Borings, \$8.50; Wrought Turnings, \$10; Axle Turnings, \$12; Coil Steel, \$13.50; Leaf Steel, \$14.50; Locomotive Tires, \$15.

Hardware.—A very good demand is reported for Heavy Hardware. The stoppage of Western rolling mills has stiffened the prices of many goods made of Bar Iron. Nuts, Washers and Carriage and Wagon Hardware have felt this influence and responded to it. The hope is expressed by merchants that the mills will remain closed for some time until stocks are depleted and the market is put in healthy condition. In Shelf Hardware some houses report a large trade in progress, while others find their volume of business only fair. Nails and Barb Wire are particularly dull, but Builders' Hardware is in good demand and seasonable articles are moving freely.

Nails.—A strong inclination to buy is developing among the heaviest purchasers in this vicinity, but thus far the Cut-Nail factories have refused to meet their views as to price. Along the Missouri River and at other Western points large stocks of Nails are still held, which were bought during the freight war, so that very little business is expected by the factories from that quarter for some time. The Wheeling factories are generally quoting \$1.80 at factory for Steel Nails, and insist on very favorable specifications as an inducement to shade this price, but the manufacturers of other localities are less firm in their views, and sales have been made by them at \$1.87½ here, and in some cases at even lower rates. Wire Nails are again moving more freely in the direction of large buyers, some sales of round lots having been made during the week at very low prices. Jobbers' quotations are now \$2.05 for small lots of Steel Nails, shaded according to circumstances, and \$2.50 @ \$2.60 for Wire Nails, according to quantity.

Barb Wire.—Very little business is now being done in this line, either by manufacturers or jobbers. Small lots are quoted at 3¢ for Painted, and 3.75¢ for Galvanized.

Copper.—A fair volume of business is reported by dealers at 25¢ rates, but the contrast is very marked with the exceedingly active demand at the corresponding period of last year. Copper Sheets were then called for in large quantities by cornice-makers, with whom they were displacing Galvanized Iron. High prices of Copper have restored the old conditions.

Pig Lead.—The sales of the week footed up about 500 tons of Common and Refined at 3.80¢ @ 3.90¢. A good inquiry is reported, which has imparted a firm undertone to business.

E. A. C. Du Plaine, brass founder and smelter, manufacturer of Rabbitt anti-friction metals, &c., has removed from 66 South Canal street to 240 South Jefferson street, Chicago. In his new location he enjoys more extensive facilities for his increasing business, and the entire plant is arranged with a view to securing the utmost convenience in handling materials.

Detroit.

WILLIAM F. JARVIS & Co., under date of July 9, report as follows: It is rather a difficult thing to give any new features relative to the Pig Iron market that would excite any particular interest. Trade is quiet. There is large buying being done almost continually, but we have to report that figures have not yet improved to any degree, and while this has been the case for the past month, very few, if any, con-

cessions are made below the quoted prices of June 1. What was looked upon here a week ago with considerable anxiety—namely, the failure of the mills to sign the Amalgamated Scale—has passed partially, many of the larger mills having accepted the terms of the association. Shipments of Ore are being increased rapidly and large business is anticipated right up to the close of navigation. Lake Superior Charcoal Iron is moving off as rapidly as is usual at this season, when Lake rates are taken advantage of. The market is firm on a very low basis, and is fairly quotable to-day as follows:

Lake Superior Charcoal, all numbers.....	\$20.00 @ \$20.50
Lake Superior Coke, all ore.....	19.00 @ 19.50
Lake Superior Coke, cinder mixed.....	18.00 @ 18.50
Standard Ohio Black Band.....	19.00 @ 19.50
Southern No. 2.....	17.75 @ 18.25
Southern Silvery.....	17.00 @ 17.50
Southern Gray Forge.....	15.50 @ 16.00
Jackson County (Ohio) Silvery.....	18.50 @ 19.00
Old Wheels.....	19.00 @ 20.00

Cincinnati.

Office of *The Iron Age*, Fourth and Main Sts.,
CINCINNATI, July 9, 1888.

Pig Iron.—A more confident tone prevails in the market for Pig Iron, and during the past week there has been a fair inquiry, but the volume of actual business has been smaller. Furnaces, where they can make the delivery desired, are asking an advance of 25¢ per ton, but while buyers are more anxious to buy at previous prices they are not disposed to pay an advance. Sales of both Foundry and Forge grades have been made in moderate amounts for both present and future delivery, but there has been more irregularity than for some time past. No. 2 Foundry is reported obtainable at \$15, but \$15.50 is generally asked. No. 2 Mill is quotable at \$13 @ \$13.50, with one lot of 1000 tons selling at the outside rate. Lake Superior Charcoal Iron has met an improved demand, with sales of 100 to 1000 ton lots, mainly at \$20.50, cash. There are no new features of prominence, there being no new conditions upon which to build a change as yet. The only point of interest is that a firmer tone prevails, and that there is an evident desire to secure low-priced Iron, but no urgency to buy, consumers well understanding the advantage to be obtained for undue haste. Prices current here, cash, f.o.b., are approximately as follows:

Hot-Blast Foundry.

Southern Coke, No. 1.....	\$16.50 @ \$17.00
Southern Coke, No. 2.....	15.50 @ 16.00
Southern Coke, No. 3.....	15.00 @ 15.50
Ohio Soft Stone Coal, No. 1.....	17.00 @ 17.50
Ohio Soft Stone Coal, No. 2.....	15.00 @ 15.50
Mahoning and Shenango Valley.....	16.50 @ 17.00
Hanging Rock Charcoal, No. 1.....	20.50 @ 22.50
Hanging Rock Charcoal, No. 2.....	19.00 @ 21.00
Tennessee and Alabama Charcoal, No. 1.....	17.50 @ 18.00
Tennessee and Alabama Charcoal, No. 2.....	16.50 @ 17.50

Forge.

Strong Neutral Coke.....	13.50 @ 14.00
Mottled Neutral Coke.....	12.50 @ 13.00
No. 1. Mill Coke.....	13.50 @ 14.00
No. 2 Mill Coke.....	13.00 @

Car-Wheel and Malleable Irons.

Southern Car-Wheel.....	20.00 @ 23.00
Hanging Rock, Cold Blast.....	22.00 @ 25.00
Lake Superior Car-Wheel and Malleable.....	21.00 @ 22.00

Manufactured Iron.—Two of the local mills have signed the scale demanded by the Amalgamated Association, but the others are yet unwilling to yield. The Iron workers, however, appear to have the best of the situation, and are confident of ultimate success. Bar Iron is reported very dull, and although the card rates are firm at 1.90¢ @ 2¢ it is reported obtainable at 1.50¢, and no doubt concessions are granted on the local product, but there is considerable irregularity. Bar and Sheet Iron—Common Bar Iron, 1.90¢ @ 2¢; Charcoal Bar Iron, 2.90¢ @ 3¢; Sheet Iron, Boiled, Nos. 10 to 27, 2.50¢ @ 3.25¢; Sheet Iron, Charcoal, Nos. 15 to 25, 3¼¢ @ 4¼¢ per lb.

Nails.—There has been a moderate demand and an easy market at previous prices, based upon 12d @ 40d, which sell at \$2 7/8 keg, with 10¢ rebate in carload lots at mills; 50d @ 60d, 25¢; 10d, 10¢; 8d @ 9d, 25¢; 6d @ 7d, 40¢; 4d @ 5d, 60¢; 3d, \$1, and 2d \$1.50 per keg more. Steel Nails sell at \$2 and Steel Wire Nails at \$2.65 @ \$2.75 7/8 keg.

Old Material.—There has been a moderate inquiry for Old Rails \$19, but holders ask \$19 @ \$20, cash. New Rails are held at \$30, and 900 tons sold at nearly this rate. Old Wheels are neglected and nominal at \$19, spot.

Chattanooga.

Office of The Iron Age, Ninth and Carter Sts.,
CHATTANOOGA, TENN., July 9, 1888.

An event of much interest to this particular section occurred a few days since, the occasion being the opening of the Chattanooga, Rome and Carrolton Railroad from this point through Rome to Carrolton. This line nearly its entire length skirts as fine beds of Bessemer or Red Ores as are to be found in the Southern States, besides giving a fourth line directly from this point to Southern Georgia and Alabama.

Pig Iron.—There appears to be no animation nor special activity in the markets. There is one thing that producers appear to be unanimous upon, and that is the present basis of prices is as low as they will go. A few spasmodic sales may and undoubtedly will be made at cut figures, but as a general thing it is thought that prices will go no lower. For the past week the inquiries for Foundry Irons here have been on the increase, and there appears to be a growing disposition in consumers to make long contracts, based on present prices, and quite a number have been made. The fact is that all along there has not been a surplus of good Foundry Irons, and all of the old furnaces have had no trouble in disposing of their output at regular prices. It is true that many of the stacks are "sold ahead," and are not worrying about the near future, while the old stacks are also keeping their desirable stocks well in hand. Of course the new plants are feeling around in every direction for a market, and in order to get in sometimes make concessions, but taking everything into consideration the feeling that prevails is quite noticeable on the better side. There has been quite a perceptible increase in the demand for Pipe Irons, and some quite large sales have been made, but at low prices.

Miscellaneous.—Strange as the statement may appear, there are new companies forming by wealthy parties for the construction of at least three more furnaces in the Southern district—one at this place and two near Birmingham. Of the one at this place there is but little doubt of its consummation, as the conditions that prevail in the organization are peculiarly favorable to its materialization. It will be of the most modern type and located but a short distance from this place. Among the different manufacturers there is no complaint of any lack of orders, and all are running full. The Chattanooga Wooden Pulley Company have their works now fully completed, and are running with a full force of hands with plenty of orders.

Louisville.

LOUISVILLE, KY., July 9, 1888.

Pig Iron.—There has been no change in the market from last week, although a few good-sized orders have been taken. There is a disposition to make purchases for long deliveries, in some instances to run for 12 months. This desire to contract for a year's supply meets with favor

from a few furnaces, but the majority prefer not to sell longer than to January 1. If the views of parties desiring to buy largely for future delivery meet with favor on the part of furnacemen, the heavy sales will give steadiness to the market and will, it is thought, advance prices for immediate wants. There is a scarcity of Foundry grades, and though price is about the same as last week, for immediate delivery buyers are willing to offer 25¢ 7/8 ton more money. The rolling mills hope that the question between them and the Amalgamated Association will soon be settled and as there is some chance of this being done, it is hoped the market will be benefited.

Southern Coke, No. 1 Foundry.....	\$16.00 @ \$17.00
" " No. 2 " " " " " "	15.00 @ 16.00
" " No. 3 3/4 " " " " " "	14.50 @ 15.00

Hanging Rock, Warm Blast.....	18.50 @ 19.50

Cleveland.

CLEVELAND, July 9, 1888.

Iron Ore.—The shipments from upper lake ports since the opening of navigation aggregate 1,275,000 tons, against about 1,350,000 tons shipped up to a corresponding period last year. Vessel rates are still growing more and more favorable to the shippers. The Escanaba rate is now 85¢, while charters can be obtained from Ashland at \$1.15 and from Marquette at \$1.10. The strike at Pittsburgh and in other iron centers has interfered perceptibly with the active buying movement noted one week ago. The same influences will probably be felt this week, but if the labor troubles, in which Ore purchasers are so directly interested, are adjusted quickly there are excellent prospects for a fair ending to a season which started out poorly. Considerable Gogebic Ore has been sold during the past week—one 25,000-ton lot for far Eastern delivery bringing a price equivalent to \$4.70 f.o.b. vessels Cleveland. Additional sales of non-Bessemer Hematites are reported at \$3.50 and very fair grades of non-Bessemer Menominee Ores have been bought for \$3.70 @ \$3.85 7/8 ton. The following are the quotations:

No. 1 Specular and Magnetic Ores, Bessemer quality.....	\$5.75 @ 6.00
No. 1 Specular and Magnetic Ores, Non-Bessemer quality.....	5.00 @ 5.25
Red Hematite Ores, Bessemer quality.....	4.75 @ 5.00
Red Hematite Ores, Non-Bessemer quality.....	3.50 @ 4.00
Menominee Range Ores, Bessemer quality.....	4.80 @ 5.00
Menominee Range Ores, Non-Bessemer quality.....	3.70 @ 4.00
Gogebic Range Ores, Bessemer quality.....	4.50 @ 5.00

Pig Iron.—The favorable outlook noticed last week has continued and the tone of the market has strengthened materially. Liberal transactions are reported, both for Irons for immediate use and for future delivery. The amounts disposed of during the past week have given the Pig-Iron market the best showing it has had for three months. Offers of Iron, not quite standard, at very low prices, have been withdrawn and stocks of all kinds are more firmly held. Dealers are to-day talking of declining orders for certain kinds of Iron, the heavy demands of the past ten days having gone a long way toward clearing up production. No. 1 strong Foundry Bessemer Iron is in the best demand at \$17.50 @ \$18.25. No. 1 American Scotch is quoted at \$17.50 @ \$18; No. 1 Soft Silvery, \$17.50 @ \$18.50 and

Lake Superior Charcoals, all numbers \$20.50 @ \$21.50.

Old Rails.—A sale or two of Old American at \$20.50 comprises the business done during the week. Old Wheels are worth \$19.50.

Nails.—Steel Nails, at \$2.60 7/8 keg, have sold freely. No change in the quotations for Iron and Steel Nails.

Pittsburgh.

Office of The Iron Age, 77 Fourth avenue,
PITTSBURGH, PA., July 10, 1888.

As regards the Iron lockout the outlook is more favorable for the iron-workers than the manufacturers. A number of firms here and elsewhere have signed the scale as presented by the Amalgamated Association during the past week and it is expected that others will do likewise before long or as soon as they get their mills repaired and ready for business. Quite a number of firms—and some of them the larger ones—are still holding out.

The outlook for fall trade is improving. Reports from nearly all sections indicate good crops and this is encouraging.

Pig Iron.—The dullness noted for some times past continues, but the prospect for an increased demand is better than it was a week ago, for the reason that several firms have signed the scale and either started up or will do so within a few days; moreover, it is probable that as soon as necessary repairs to mills are made other firms will sign and start up. However, trade in Pig Iron at present is very dull, and to furnacemen prices are exceedingly unsatisfactory; some furnaces have blown out and others will do so as soon as they have worked up their stock of raw material. Consumers not only here, but throughout the entire district, are very low in stock, and as soon as the mills are started up they will be obliged to replenish. Prices as compared with those of a week ago remain unchanged, as follows:

Neutral Gray Forge.....	\$14.00 @ \$14.50, 4 mos.
All Ore Mill.....	15.00 @ 15.50 "
White and Mottled.....	13.50 @ 14.00 "
No. 1 Foundry.....	16.50 @ 16.75 "
No. 2 Foundry.....	15.75 @ 16.00 "
No. 3 Foundry.....	14.75 @ 15.00 "
Charcoal Foundry.....	22.00 @ 24.00 "
Cold Blast Charcoal.....	25.00 @ 28.00 "
Bessemer.....	17.00 @ 17.50 "

Bessemer Iron continues to hold at the recent advance; sale of 1000 tons reported at \$17.25, cash. There is an evident intention on the part of some one here to bear the market for Bessemer by making a report of sales at \$16.50, cash, which is from 50¢ to 75¢ below the ideas of furnacemen, and, so far as we can learn, no reliable sales have been reported below our quotations.

Muck Bar.—But very little doing; buyers are scarce and sellers are not very numerous, even at present prices, \$26 @ \$26.50, cash.

Manufactured Iron.—The demand for all kinds of Merchant Iron continues light, and that for specialties is nothing to brag of; however, trade is nearly always rather quiet at this particular time, and there will doubtless be an improvement before the close of the present month. Prices remain unchanged, but to manufacturers unsatisfactory; Bars, \$1.70 @ \$1.80; Plates, \$2.10 @ \$2.20; No. 24 Sheet, \$2.70 @ \$2.80, all 60 days, 2 % off for cash. There is nothing like the demand for Skelp Iron there was a year ago, when some of the mills had all they could do.

Nails.—The demand continues light, and, while it is hoped that there will soon be a change for the better, the outlook is not as encouraging as it might be. Manufacturers report orders scarce, and that even at full card rates the margin for profit is small. Prices are still quoted upon a basis of \$1.90 for 12d to 40d

in carlots and upward, 60 days, 2 % off for cash. It looks as if the Nail trade would soon be a thing of the past so far at least as regards Pittsburgh; some manufacturers have abandoned it altogether.

Wrought-Iron Pipe.—This important branch of the Iron trade continues in a depressed and unsatisfactory condition; orders continue few and far between, and some of the mills have been shut down for several weeks. The great trouble is that but little is being done in the way of oil and natural gas development, and there is but comparatively little Pipe wanted in consequence. What makes it still worse is that in addition to a very materially reduced demand the capacity for making Pipe has been materially increased within the past two years.

Old Rails.—Continue dull, but, with a good supply and light offerings, there has been no further change in prices. We continue to quote American at \$21 @ \$21.50, with a sale of 500 tons reported at \$21.25. There has not been a sale of Foreign Rails reported in this market for several months, having been supplanted by American, which, in addition to being cheaper, have the preference at the same price.

Steel Rails.—There have been no sales reported here recently. Former prices are still quoted by manufacturers, but the probability is that desirable orders can be placed for less.

Billets, &c.—There is a fair business being done in Bessemer Steel Billets, with but little change recently in prices. Sales of some 6000 tons reported at \$28 @ \$28.25, cash, delivered at buyers' works. We can also report a sale of Sheet Blooms at \$29, delivered. There was a sale of 1000 tons domestic Rail Ends on private terms, understood to be considerably below \$17. American Steel Wire Rods are quoted at \$41.50 @ \$42.50.

Merchant Steel.—There are no new features to note; business continues light, while prices remain unchanged. Best brands of Tool Steel, 8½¢; Crucible Spring, 4½¢; Crucible Machinery, 5¢; Open-Hearth Machinery, 2½¢. The Steel mill of Singer, Nimick & Co. has been started up non-union.

Railway Track Supplies.—The demand for everything in this line continues light for the season, and desirable orders could probably be placed at prices below our quotations. Spikes, \$2 @ \$2.10, 30 days, delivered; Splice Bars, \$1.80 @ \$1.90; Track Bolts, \$2.85 with Square and \$2.95 with Hexagon Nuts. The mills here making a specialty of these report business as having been dull all this year.

Old Material.—There is no improvement in demand, and prices are weak and drooping. There is but little doing, and it is difficult to give reliable quotations in consequence. We quote nominally at \$19 @ \$20, net ton, for No. 1 Wrought Scrap; \$12 @ \$13 for Wrought Turnings; \$23 @ \$24 for Car Axles; \$11 @ \$12 for Cast Borings, gross ton; Cast Scrap, \$14.50 @ \$15, gross.

New York.

Office of *The Iron Age*, 66 and 68 Duane St.,
New York, July 11, 1888.

American Pig.—As is natural immediately after the opening of July, business has been exceedingly dull during the past week, only moderate transactions being reported at fairly steady prices. There is considerable pressure to sell Mill Irons suitable for puddling, a northern Gray Forge having been offered for this purpose at \$14.60, at tidewater, the river freight probably being exceptionally low. Gray Forge for foundry purposes is not, how-

ever, available at such a figure. We quote for standard and choice Northern Irons, tidewater delivery, \$17.50 @ \$18.50 for No. 1 Foundry, \$16.50 @ \$17.50 for No. 2 Foundry and \$14.75 @ \$16 for Gray Forge. A good many foundries stop for repairs for a few weeks early in July, and the current consumption is therefore probably lighter than usual.

Scotch Pig.—The market is very dull, and we quote, nominally, Coltness, \$19.75 @ \$20; Summerlee, \$19.50 @ \$19.75; Langloan, \$19 @ \$19.50, and Dalmellington, \$18 @ \$18.50.

Spiegeleisen.—We can report the sale of 5000 tons of English 20 % at the range of \$27 @ \$27.25 to an Eastern mill.

Bar Iron.—The market is quiet, and we continue our quotations for carload lots on dock, half extras, Common Iron, 1.6¢ @ 1.65¢; Medium, 1.65¢ @ 1.7¢, and Refined, 1.75¢ @ 1.8¢.

Structural Iron.—No transactions of any magnitude have been placed lately in this market, and there are none of any size in sight. We quote: Bridge Plates, 1.9¢ @ 2¢; Universal Mill Plates, 2¢, delivered; Angles, 2¢ @ 2.2¢; Tees, 2.5¢ @ 2.7¢, and Channels and Beams, 3.3¢, on dock.

Plates.—We quote: Tank, 1.9¢ @ 2¢; Shell, 2.15¢ @ 2.30¢; Steel Tank, 2.4¢ @ 2.15¢; Shell, 2.15¢ @ 2.25¢; Flange, 2.6¢ @ 2.75¢, and Fire-Box, 3¢ @ 3.25¢.

Steel Rails.—The market is exceedingly dull, no transactions of any magnitude whatever having been reported. We continue to quote, nominally, \$30 for moderate lots at Eastern mill. In the West apparently very little business has been done during the past week. The meeting of the Rail Makers' Association is to be held at Long Branch on Thursday, August 2.

Wire Rods.—We continue to quote, with little business transacted, \$40 @ \$40.50 at tidewater. It is reported that one of the leading importers of Wire Rods has, during the past month, purchased considerable American Rods in the West to fill contracts with Western consumers.

Old Rails.—Practically no business has been reported, a few small lots, spot and Sound ports, being offered at \$20 @ \$20.50 for T's, with no demand.

Fastenings.—The market is very dull, with Spikes at \$2 @ \$2.05, delivered, and Angle Bars, 1.85¢ @ 1.9¢, delivered.

Metal Market.

Copper.—Steadiness has characterized the London market since our last week's report, and a rising tendency our own. In London on Thursday of last week Spot Chili Bars opened at £81. 2/6, and futures at £78, closing yesterday at £81 and £78 respectively, sales aggregating 350 tons, while here it at first appeared as though the syndicate were manipulating the market preparatory to effecting another sale to manufacturers, but the stiffening tendency gained strength later on by the covering of shorts, alarmed by the meager offerings. A couple of hundred thousand pounds were thus sold, comprising 25,000 lb November at 16.40¢; 25,000 lb December at 16.25¢, and January at 16¢; 75,000 lb at 16.90¢ July; 16.90¢ September, and 16.30¢ December, and closing yesterday with 100,000 lb July at 16.85¢. London cables steadiness to-day at £81, spot, and £78, three months. Best Selected rose from £75. 10/ to £76. Our market closes dull, but firm to-day with sales of 500,000 lb September at 16.60¢. During the first 11 months of the fiscal year there were shipped from the United States 22,504,785 lb of Ingot Copper, against 17,240,296 lb the year before.

The work of unwatering the Calumet and Hecla Company's mine is now progressing quite satisfactorily. The trouble with them was due to the water in the mine being too hot to condense the steam of the Worthington condensing pumps rapidly enough, but these are now doing good work. On the Paris Stock Exchange Rio Tinto shares rose toward the close of last week 7½ francs. The predictions from London that the French Copper syndicate is on the eve of collapsing for financial reasons are taken no notice of on this side, as in England the metal trade has been inimical to the syndicate all along. Spanish exportation of Pyrites the first four months has been 270,754 tons, against 266,679 in 1887 and 233,555 in 1886; of Precipitate 10,164 tons, against 9823 and 8125.

Tin.—The favorable statistics of the close of last month have had the effect of developing a strong upward movement during the week, winding up with a recoil. On Thursday last London opened at £84. 10/, spot, and £84. 15/, futures, advancing the next day to £86 and £86. 17/ respectively, but receding to £82. 10/ and £83 yesterday, the total sales summing up 1150 tons. Here the market followed closely, the sales made in succession being 20 tons spot at 18.85¢; 10 tons July at 18.90¢; 40 tons at 19¢ for spot and 19¢ July; 20 tons August at 18.60¢ @ 18.65¢, and yesterday 60 tons at 18.20¢ for July, 18.10¢ @ 18.25¢ for August, and 18.05¢ for September. This morning London again gives way slightly, to £81. 5/ spot and £82 futures, while our own market closes unsettled, with a sale of 10 tons August at 18¢. The import of Tin into the United States during the first 11 months of the fiscal year has been 29,131,506 lb, against 28,584,560 lb in 1887. The June shipments from the Straits to this country were 200 tons, against 650, June, 1887; to England 1000, against 1200. Since January 1 they were respectively 850 tons, against 2600, and 10,000, against 6600. **Tin Plates.**—The rise in Tin brought more business by bringing in parties who were ready to operate before it took place, and considerably more was done in futures. The spot market remains unaltered; stocks are low, but the demand is light. The import of Tin Plates into the United States during the first 11 months of the fiscal year has been 573,543,195 lb, against 512,251,317 during the corresponding period of the previous year. We quote at the close, large lines, on the spot: Siemens-Martin Steel, Charcoal finish, \$5 @ \$5.25; ditto Coke finish, \$4.80; Ternes, \$4.80 @ \$4.40; Bessemer Cokes, \$4.50 @ \$4.60, and Wasters, \$4.35 @ \$4.40. Coke Tins are selling at 13/ in Liverpool, for prompt delivery.

The London *Mining Journal*, in its issue of June 30, remarks: "After a long and weary struggle during the period of inflated prices of Tin, it is gratifying to note that this industry has not only recovered its normal position, but that there is a marked improvement in the trade both as regards volume and prices. The exports last year were the largest on record, but for the first five months of this year in comparison with the same period of 1887, as shown by the Board of Trade returns, there has been an increase of 6 %. The increases are most marked in the exports to Germany and to the United States. The latter country is by far our best customer, taking 76 % of the exports and over 52 % of the total make of this country. The relative improvement in prices is shown by comparison with those current early in the autumn of last year, when uninfluenced by the Tin question. Thus it may be noted that the price of Bessemer Steel Coke Plates, which is one of the brands in most active demand, was in September officially quoted at 13/ @ 13/3 per box of IC, and Straits Tin at

an average of about £102 $\frac{1}{2}$ ton. The present quotation for Plates is the same, with foreign Tin at about £82. This difference in Tin would mean nearly 6d. $\frac{1}{2}$ box intrinsic value. The improvement is to be accounted for by the active demand which has naturally followed the period of high prices and stagnation, and by the advantages which makers are reaping by direct shipments from Swansea, the home of the industry. It is somewhat to be regretted, however, that the revival has been followed, even in this brief space, by signs which threaten the trade with its ever-recurring evil of overproduction. Already we hear of the erection of new mills and of extensive additions to existing works.

Lead.—About 1000 tons Common Domestic were sold during the week in the open market at 4¢ @ 4.10¢, but the price at the close is 4.05¢ flat, there being sellers, but no buyers at this. At the Metal Exchange some 565 tons were sold since last Thursday at the following prices: July, 4.07½¢ @ 4.10¢, and August at 4.12½¢, closing at 4¢ @ 4.05¢. In Europe, meanwhile, there have been advancing markets under rumors that the syndicate to be formed is in a fair way of constituting itself, yet not much reliance is placed on these rumors on this side. Stolberg and the other German companies apprehend a thorn in their sides from the two Lead refineries going into operation at Antwerp, and try to get up a syndicate in which the Belgians are to become members in order to counteract or prevent the competition they fear at the latter's hands. This is about all, and the outlook is extremely dim; but the London operators, who will catch at a straw, dive in and raise the price £1 $\frac{1}{2}$ ton, Soft Spanish coming £13 and English Pig £13/5. Both Chicago and St. Louis have been firm at 3.85¢. The export of Pig Lead from Spain during the first four months has been 44,461 tons, against same time last year 42,972, and 38,187 in 1886.

Spelter and Zinc.—Only a moderate demand has been noticeable on the spot at 4½¢, Common Domestic, while Silesian may be quoted 5¢ @ 5½¢, having improved in London during the week from £14. 15/ to £15. 15/.

Antimony.—Hallett gave way in London from £40 to £39, and is selling moderately here at 10¢ to 10½¢, while Cookson remains steady at 13½¢ @ 13½¢.

New York Metal Exchange.

The following sales are reported:

THURSDAY, July 5.	
82 tons Lead, July.....	4.10¢
20 tons Tin, spot.....	18.55¢
10 tons Tin, July.....	18.90¢
25,000 lb Copper, November.....	18.40¢
100 tons Lead, July.....	4.07½¢
FRIDAY, July 6.	
80 tons Tin, spot.....	19.00¢
16 tons Lead, July.....	4.10¢
10 tons Tin, July.....	19.00¢
25,000 lb Copper, December.....	18.25¢
25,000 lb Copper, January.....	18.00¢
100 tons Lead, August.....	4.12½¢
100 tons Lead, July.....	4.05¢
16 tons Lead, spot.....	4.05¢
10 tons Lead, July.....	4.05¢
50 tons Lead, July.....	4.06¢
16 tons Lead, July.....	4.04¢
16 tons Lead, July.....	4.07½¢
116 tons Lead, August.....	4.10¢
MONDAY, July 9.	
25,000 lb Copper, July.....	16.90¢
25,000 lb Copper, December.....	16.30¢
10 tons Tin, August.....	18.65¢
10 tons Tin, August.....	18.65¢
25,000 lb Copper, September.....	16.60¢
TUESDAY, July 10	
10 tons Tin, July.....	18.20¢
20 tons Tin, August.....	18.30¢
10 tons Tin, August.....	18.25¢
100,000 lb Copper, July.....	16.85¢
10 tons Tin, August.....	18.10¢
10 tons Tin, September.....	18.05¢
WEDNESDAY, July 11.	
50,000 lb Lake Copper, September.....	16.60¢
10 tons Tin, August.....	18.00¢

Coal Market.

There is comparatively little new business offering, but there is more doing in the way of delivery on former orders, and a perceptible renewal of inquiry with reference to laying in future supplies. The wholesale operators are evidently anticipating an increased demand at an early date, production at the mines having been pushed with unwonted vigor during the last few days. The Lehigh region suddenly increased its output from 87,000 tons to 172,000 tons, and the Lackawanna from 292,000 tons in the previous week to 348,000, and this despite the Fourth of July interruption. This looks like confidence in the situation, not only in regard to future consumption, but as regards ability to maintain prices. It is understood that prices now realized approximate more closely to the schedule, and there is full reason for the belief that the proposed advance on or about July 15 will take effect. According to report the advance will be 10¢ on Broken, 15¢ on Egg and 25¢ on Stove and Chestnut, or about an average of 15¢ @ 20¢ $\frac{1}{2}$ ton. The question will be finally decided on Friday. The Philadelphia *Ledger* says: "Within the past week the movement of Coal eastward has been accelerated by the increased supply of vessels, and the demand from that quarter is daily improving. The Boston market is reported as much brighter and the demand for Coal increasing. The stocks of Anthracite at tidewater shipping points are beginning to decrease. A few weeks ago there was in stock at Port Richmond about 180,000 tons of all sizes of Anthracite belonging to the Reading Company, and besides the individual operators had stored there 40,000 tons additional, making altogether 220,000 tons. This unusually large stock at that shipping point has already been heavily reduced, as the total stock at Port Richmond on Saturday was reported at less than 175,000 tons. Reading Pea is in full supply at \$2.50, f.o.b.; can buy Pea as low as \$2.40; Buckshot, \$2 @ \$2.10, f.o.b.

The Anthracite Coal production during the week ended July 7 amounted to 671,382 tons, as compared with 573,572 tons for the same week last year, and for the year 1888 to date the aggregate is 16,969,701 tons, as against 17,195,144 tons for the same time in 1887, a decrease of 225,000 tons. Compared with the previous week the increase is 146,619 tons. Quotations are as follows: Wyoming Free Burning, f.o.b. at South Amboy and Weehawken, Broken or Grate, \$3.75; Egg, \$4; Stove and Chestnut, \$4.25; Reading Hard White Ash, at Port Elizabeth. Lump and Steamboat, \$4.25; Broken, \$4; Egg, \$4.10; Stove, \$4.25; Chestnut, \$4.15; Pea, \$3. Free burning White Ash is the same, except Broken, \$3.75, and Egg, \$4. Lehigh Coals are: For Lump, \$4.50 Broken, \$4.20; Egg, Stove and Chestnut, \$4.10 $\frac{1}{2}$ ton, f.o.b. at the loading ports.

The Bituminous trade is active on old orders. Very few orders have been booked this month.

Financial.

The conviction is becoming more general that business throughout the country is in better shape and in larger volume, taken as a whole, than common report has represented. The depression of which croakers are prone to speak is, with a few notable exceptions, found in speculative articles on the Stock Exchange and among those whose commodities for the most part have only an imaginary existence. Well grounded confidence is felt in abundant crops, of which the assurance is stronger every day. Apprehension of money troubles is for the present dismissed, and al-

though the railroad situation is demoralized by the cutting of rates there are incidental advantages from which the mercantile classes are sure to profit. The wages question, particularly among iron operatives, is a serious drawback. Yet there is a feeling that pending difficulties must soon be adjusted, and that an active fall trade will open in due time. With reference to business prospects President Chauncey M. Depew, of the New York Central, is reported as saying: "I certainly think that business this fall will be very brisk. Indications all point to improving prosperity. You can safely say that the trouble growing out of concessions on dressed beef and live cattle rates has been grossly exaggerated. * * * I feel hopeful because I am convinced that general business is on the mend."

The general markets are quiet. Wheat, after a further advance, is again easier, exporters buying moderately. Corn was offered lower on spot stock. The provision market was disturbed by reports from Europe of the prosecution of owners and manufacturers of lard for alleged adulteration. In cotton there is a desire to sell in prospect of the new crop. The first bale of new crop Georgia cotton was from Albany, Ga., 5th inst., to this city. This is some days ahead in any previous year for the first shipment from that State. Crop accounts generally are encouraging despite meteorological extremes in various sections of an extraordinary character—a snow storm in Minnesota and 120° temperature in Illinois. Harvesting of wheat is in progress as far north as Ohio, Indiana and Michigan. Vice-President Clark, of the Missouri Pacific Railroad, telegraphs from St. Louis that the crops along the entire length of the Missouri Pacific system are of the most promising character, and that the yield of all kinds of produce will be enormous. In Kansas particularly the producers are sanguine of harvesting the largest crops ever gathered in that State. Officials of the Manitoba say that their crop advices continue very favorable from all sections. Vice-President Oakes, of the Northern Pacific, telegraphs that the crop prospects along his road are the finest ever known on the line.

The weekly statement of the Associated Banks showed a further decrease of \$2,500,425 in excess of reserve, which is now \$24,316,800; at the corresponding time in 1887 the excess was only \$6,352,450. Specie showed an increase of \$272,600, legal tenders decreased \$1,378,000. In loans there was a further expansion of \$3,890,900. Deposits increased \$5,580,100.

The exports of specie during the week were \$343,000, but Wednesday's steamer takes out \$1,000,000 in addition to Germany on a special order. Since January the exports amount to \$21,039,000, or about double those of the corresponding period last year.

Up to date the Secretary of the Treasury has purchased under the April circular \$18,452,400 4% and \$8,398,550 4½% bonds. These bonds cost the Government \$32,474,458, but the saving to the Government over what it would have cost to redeem them at maturity aggregates \$9,892,335.

The changes that have occurred in money circulation during the year are much less than are commonly supposed. Of the coin issues gold has increased by more than \$15,000,000, and silver, standard dollars and fractional, has increased by \$3,000,000. Of the paper issues United States notes have decreased by \$18,000,000, and national bank notes by \$31,500,000; while silver certificates have increased by \$58,000,000 and gold certificates by \$28,500,000. Thus the coin circulation of all kinds has been expanded by \$18,000,000 and the note circulation by \$37,060,000.

According to the Treasurer's report there were more gold certificates in circulation on June 30 than there has been at the end of any month since September, 1885, the amount being 119,887,370. The silver certificates in circulation on that day amounted to \$200,387,376, the highest figure ever reached. The coinage of the Bland silver dollar has reached nearly \$300,000,000, the exact figures being \$299,424,790. Of these only \$55,545,303 were in circulation on June 30, which is a trifle more than were in circulation at the end of the fiscal year 1886-87.

The imports of merchandise at this port are again heavier, the total for the week being valued at \$9,986,000, of which \$2,556,000 represents dry goods. Since January 1 the total is \$250,143,000, as compared with \$245,789,000 for the same time last year and \$225,000,000 in 1886. The exports for the week were \$5,214,657.

Twenty-five banks have now entered the new system by which deposits are made at the Sub-Treasury in the morning, against which checks can be drawn throughout the day for the payment of customs duties. The chief advantage of the system is that it relieves banks and importers of the risk and trouble of carrying the actual cash to the Custom-House. The banks which have adopted this new method include nearly all those whose customers have extensive Custom-House transactions. In view of the relations of the Sub-Treasury and Clearing-House banks, and their interdependence and mutual obligations, it is believed that no possible risk would be involved in the acceptance by the Collector of checks certified by national banks.

The Stock Exchange markets show an improved tone. On Thursday coal shares were strengthened by the impending advance in the price of coal. The report that the Iowa rate sheet would take effect at once had no influence. On Friday it was understood that the United States Court would restrain the Iowa commissioners, whereupon St. Paul and Northwestern advanced, and other grangers were stimulated. On Saturday and Monday strength was imparted by higher prices in London, although Missouri Pacific was pressed for sale on a report that Gould had put on the market about \$15,000,000 of stock. The only news of importance was that the Canadian Pacific had stopped cutting rates on dressed beef and live stock, and that the road would advance the tariff on Monday next.

On Tuesday there was a better feeling than for a long time. The Bureau reports, showing both winter and spring wheat and corn to be in improving position, were used to advance the grangers. Compared with the June report, an improvement of 2.3 % is shown in winter wheat and 3.1 % in spring wheat.

The following shows the bid quotations for Government bonds:

U. S. 4½, 1891, Registered.....	107¼ @
U. S. 4½, 1891, coupon.....	107¼ @
U. S. 4, 1907, registered.....	127¼ @
U. S. 4, 1907, coupon.....	127¼ @
U. S. Currency 6s.....	119 @

Bank clearances in 38 cities last week show a decrease of 1.1 %, compared with the same week last year, against a decrease of 34.1 % the previous week. Outside of New York there was an increase of 13.5 % as compared with last year, against a decrease of 15.3 % the previous week. In accounting for differences the present decreased volume of speculation must be considered.

Money on call, 1½ %. Time loans on good collateral are quoted as follows: Three months, 3 %; six months, 4 %, and good double-name paper is readily placed at 4 % @ 4½ %. There is very little offering.

Sterling exchange quiet and steady. Nominal asking rates unchanged at \$4.87½ @ \$4.89½.

Imports.

The imports of Iron and Steel, Hardware, &c., at this port from June 29 to July 5, inclusive, and from January 1 to July 5, inclusive, were as follows:

Iron and Steel.

	June 29 to July 5, Tons.	Jan. 1 to July 5, Tons.
Iron Ore: Co-mack & Co.....	1,022	1,022
Pig Iron: Naylor & Co.....	285	8,475
G. W. Stetson & Co.....	50	10,750
Spiegelisen: Naylor & Co.....	406	4,785
W. H. Arkell.....	50	50
Steel: W. F. Wagner.....	54	813
Montgomery & Co.....	12	60

British Iron and Metal Markets.

[Special Cable Dispatch to The Iron Age.]
LONDON, WEDNESDAY, July 11, 1888.

The market for Block Tin has agitated, first advancing sharply, to the surprise of most speculators, and subsequently reacting nearly as rapidly. The rise was due in a good measure to the fact that a large portion of the deliveries early in the month went to consumers, who bought heavily when prices were near the lowest point, thus disappointing speculative "shorts," who had calculated upon a large amount of Tin coming on the market. This caused uneasiness, which in turn was intensified by continued reports of consumers storing stocks in the colonies instead of selling, as customary. Hence a lively demand to cover and the rapid advance in prices. The upward movement brought out considerable stock from exporters at the primary points, and that, together with realizations by local holders, resulted in the subsequent decline after the major portion of the "shorts" were covered. The market is now in a very sensitive condition, greatly facilitating manipulation.

Operations in Chili Bars have been on a very moderate scale, and prices have undergone only slight change during the week. The movement referred to last week to change the form of contracts so that other Copper than Chili Bars may be a good delivery has resulted more satisfactorily than was anticipated. It has been decided to admit a number of brands equal or superior, but the form of contract has not yet been framed by the committee chosen for that purpose. However, some 800 tons have already changed hands under the new rule, the syndicate taking it at, it is understood, £69 for three months' futures.

The Tin-Plate market has been quiet pending the quarterly meeting and prices are practically the same as current last week. The exports to the United States last month were 23,000 tons, or 2000 tons less than during June a year ago.

There is very little change in the Pig Iron trade, save that a start has been forced in the direction of reduced production in Scotland, four furnaces there having been blown out the past week. There is no outside interest in warrants at the present time, and operators within the trade are disinclined to make a decided move. In the Middlesboro' product, however, there continues to be a brisk trade. Last month's exports of Pig Iron were only 13,000 tons, against 44,000 tons in June, 1887.

Scotch Pig.—Prices have raised but slightly and business has continued slow:

No. 1 Coitness, f.o.b. Glasgow.....	47/
No. 1 Summerlee, " ".....	46/6
No. 1 Gartsherrie, " ".....	44/
No. 1 Langloan, " ".....	44/
No. 1 Cambro, " ".....	39/8
No. 1 Shotts, " ".....	45/
No. 1 Glenarnock, " ".....	43/
No. 1 Dalmellington, " ".....	39/6
No. 1 Eglinton, " ".....	38/

Steamer freights, Glasgow to New York, 5/; Liverpool to New York, 7/6.

Cleveland Pig.—The market very firm, without, however, any increased activity. No. 1 Middlesboro', G.M.B., 84/; No. 3 do., 81/9.

Bessemer Pig.—Prices are held firmly, but business is only fair. West Coast brands, mixed numbers, 48/, f.o.b. shipping point.

Spiegeleisen.—The market continues firm, with demand good. English 20 % quoted 80/, f.o.b. N. W. England shipping point.

Steel Rails.—There has been no material change in this department. Standard sections quoted at £3. 17/, f.o.b. at N. W. England shipping point. Mid-lesboro' district about 2/6 @ 5/ less.

Steel Blooms.—A fair business, but prices still rather weak. We quote at £3. 18/6 for 7 x 7, f.o.b. at N. W. England shipping point.

Steel Billets.—A steady market, with the demand running fair. Bessemer, 2½ x 2½ inch, £3. 16/, f.o.b. at N. W. England shipping point.

Steel Slabs.—Only moderate sales making, but prices steady. Bessemer, £3. 19/3, f.o.b. at N. W. England shipping point.

Steel Wire Rods.—Values are weaker and the demand is slow. Mild Steel No. 6 quoted at £5. 12/6 and No. 5 at £5. 10/, f.o.b. at N. W. England shipping point.

Old Rails.—Demand very slow and prices weaker. Tees quoted at £2. 12/6, and Double Heads £2. 17/6, c.i.f., New York.

Scrap Iron.—Market continues dull and prices are nominal. Heavy Wrought at £2. 7/6, f.o.b.

Crop Ends.—Very little inquiry. Former prices asked. Bessemer quoted £2. 5/ @ £2. 7/6, f.o.b.

Tin Plate.—A fair trade at about former prices. We quote, f.o.b., Liverpool:

IC Charcoal, Allaway grade	14/6 @ 15/
IC Bessemer steel, Coke finish	12/9 @ 13/
IC Siemens	18/3 @ 18/6
IC Coke, B. V. grade	12/9 @ 13/
Charcoal, Terne, Dean grade	12/6 @ 12/9

Manufactured Iron.—The market steady with trade fair. We quote, f.o.b. Liverpool:

Staff. Ord. Marked Bars	4 17 6 @ 5 0 0
Common	4 17 6 @ 5 0 0
Bl'k Sheet, singles	4 12 6 @ 4 10 0
Welsh Bars (f.o.b. Wales)	4 12 6 @ 4 10 0

Tin.—Market closes strong after considerable fluctuation. Straits quoted at £83 @ £83. 10/, spot, and £83. 7/6 for three months' futures.

Copper.—Dealings moderate, but prices fairly well maintained. Chili Bars closed at £81, spot, and £78. 2/6, three months' futures. Best Selected, £75, nominal.

Lead.—There has been a good business at better prices. Soft Spanish, £13 at the close.

Spelter.—Demand more active and the market strong. Silesian, ordinary, £15. 15/ @ £15. 17/6 at the close.

The Llynvi Tondy Works collieries have been purchased by Colonel North for £150,000.

Sparrow's celebrated Ffrwdd Works, at Wrexham, which have been idle for several years, are about to be restarted.

A plan has been submitted for supplying Paris with pure water from the lake of Neufschatel, at a cost of \$100,000,000. The proposed aqueduct would be 312 miles in length, including a tunnel 22 miles long under the Jura mountains. The lake is 1620 feet above the average of Parisian streets.

The Western Wages Scale.

With the exception that three or four more firms have signed the scale, the condition of the lockout in the Western iron mills presents no new features from those noticed in our issue of last week. It is claimed, however, by the officials of the Amalgamated Association that they have reliable advices to the effect that several more firms will sign during the present week and that they have no fear as to the final outcome of the struggle. The developments during the first week of the lockout would seem to bear out this opinion, as up to Monday, the 9th inst., the following named firms had signed the Amalgamated scale:

Laughlin and Junction Steel Company, Mingo Junction, Ohio.

Akron Iron Company, Akron, Ohio.

Apollo Iron and Steel Company, Pittsburgh, Pa.

Cleveland Hardware Company, Cleveland, Ohio.

Aurora Iron Company, Aurora, Ind.

Maumee Rolling Mill Company, Toledo, Ohio.

Oliver Brothers & Philips, Pittsburgh, Pa.

Lookout Iron Company, Chattanooga, Tenn.

P. H. Laufman & Co., Limited, Apollo, Pa.

Carnegie, Phipps & Co., Limited, for the Twenty-ninth Street Iron Works, Union Iron Mills, and the Homestead Steel Works.

Findlay Iron and Steel Company, Findlay, Ohio.

Findlay Rolling Mills Company, Findlay, Ohio.

Republic Iron Works, Limited, Pittsburgh, Pa.

Scottdale Iron and Steel Company, Limited, Scottdale, Pa.

Moorhead Brother & Co., Pittsburgh, Pa.

Anchor Iron and Steel Works, Newport, Ky.

Lawrence Iron and Steel Company, Iron-ton, Ohio.

Summers Brothers & Co., Struthers, Ohio.

Linden Steel Company, Limited, Pittsburgh, Pa.

New Albany Rail Mill Company, New Albany, Ind.

Kittanning Iron Company, Limited, Kittanning, Pa.

The last-named firm signed the scale on Saturday, the 7th inst., and is the last signature reported at this writing. The report published in some of the Pittsburgh papers that the nail manufacturers had signed the nailers' scale is incorrect. There are but three firms in Pittsburgh that are engaged in the manufacture of nails, these being Shoenberger & Co., Chess, Cook & Co. and Jones & Laughlins, Limited. None of these firms have signed the scale. Chairman Keating also denies the statement that a meeting of the Manufacturers' Association has been called for the purpose of discussing the present situation of affairs. No meeting has been called, nor will there be one held, unless future developments make it necessary.

Among newly authorized corporations in the State of Illinois is the following: Paige Iron Works, capital \$25,000; to purchase iron, steel, copper and other metals, and to manufacture articles from same; incorporators, John Crerar, Edward S. Shepherd and Alonzo W. Paige.

The Junction Iron Company, of Mingo Junction, Ala., have just contracted for a new blast furnace, 17 x 75 feet, with J. P. Witherow, the well-known engineer and contractor, of Pittsburgh, Pa. It is to take the place of one of their former fur-

naces, and is not an additional one in the sense of increasing the company's plant. The firm have also contracted with Mackintosh, Hemphill & Co. for an additional blowing engine for immediate erection. When all is completed, however, the company will operate but one furnace, as has been their custom in the past.

Washington News.

(From Our Regular Correspondent.)

WASHINGTON, D. C., July 10, 1888.

The tariff discussion in the House still lags along, notwithstanding occasional spasmodic efforts to facilitate its weary way through the parliamentary hopper. The optimistic reasoners have been arguing for the last month that the bill would be passed by the middle of July. The pessimistic philosophers are still claiming September or later. The most anxious part of the situation just now is as to the ability of Mr. Mills and his friends to pass the bill at the end of the debate. In order to ascertain within the range of a reasonable judgment in the premises, a canvass has been made which shows that the prospects are not certain. After all the amending and threatening and conceding and lashing the chances are doubtful, although there are those who think that the bill ought to pass, not as an economic measure, but for political considerations on both sides. The Democratic majority, as is known, is 15. To change the result on a full vote would require eight votes with the solid Republican strength. Based upon this elementary proposition comes the fact that the measure, whatever may be its fate, will not have any votes to spare on either side.

The canvass of the Democratic vote has developed the fact that the following of their numbers will not vote for the bill: Merriman, of New York City; Greenman, of Troy; Randall, of Philadelphia; Snowden, of Lehigh; Foran, of Cleveland, and Pidcock of the Fourth District of New Jersey. This makes six Democrats who will not vote for the bill. There are two who are in doubt. Vance, of Connecticut, who was "accommodated" to the extent of taking care of screws and cutlery, has always been violently opposed to the bill, but is not so vigorous in his expressions, although he believes the bill will defeat the Democrats in this State. General Tracy, of the Albany district, has also always opposed the bill until recently. Yet he has not said that he will vote for it. This would make the necessary eight to defeat.

On the Republican side the canvass shows but one who will vote for the bill. He is Fitch, of New York. The ranks, otherwise, are claimed to be firm. It is not improbable that a sufficient number will not vote so as to let the bill pass, otherwise the plans of the Republicans will not materialize. They propose to have the House pass their bill and the Republican Senate pass their substitute and then go before the country. The House failing to pass theirs there can be no substitute, as the Senate cannot originate a revenue measure. The Senate proposition will not be ready for several weeks. There have been many parties here who have been heard, but progress has been slow. From present indications the Senate substitute will be somewhat of a modification of the Randall bill. The metal features will be about the same.

The Board of Electrical Control in this city have resorted to summary measures to compel the illuminating companies to put their wires in the ground. The latter respond that the subways are not feasible for their purposes. The case will come up in the courts on the 12th inst.

Hardware.

The volume of business is limited, manufacturers and merchants being generally occupied in making their arrangements for the season's trade. Prices of Hardware in general have not been, as a rule, revised, there being less than the usual number of new discount sheets issued. In several lines of goods there have, however, been changes in price, particulars of which are given below. The market in several lines is not characterized by as much firmness as might be desired, and there has been within the last few weeks a reduction in the price of some leading goods. The general tone is not strong, and merchants and manufacturers are disposed to move conservatively. There is, however, a hopeful feeling prevailing in regard to fall business, which is regarded as likely to be of fair volume.

Cut Nails.

The week has been a very quiet one in the New York Cut-Nail trade, the market remaining unchanged at \$1.90 to \$1.95 for carload lots on dock, and \$1.95 to \$2 for small lots from store. It is stated that there is less shading from these figures by sellers of Nails not recognized as quite up to the standard than there has been for some time.

Wire Nails.

Since our last report there has been no improvement in price and some quotations are a shade lower. The price for carload lots, at factory, may be named at \$2.40 to \$2.50. Moderate lots are selling in this market at \$2.50 to \$2.60 and small lots at \$2.60 to \$2.65.

At a meeting of the Wire Nail Association, held in Pittsburgh several months ago, it was decided that in order to prevent buyers from ordering Standard Nails on a miscellaneous basis that the heading "Miscellaneous Wire-Nail List" should be adopted for all Nails except Standard Nails in kegs, and that Nails provided for in the Standard list should not be sold at a discount from this miscellaneous list. It was also resolved to make the following extras to be added to the list:

$\frac{1}{4}$ -pound papers.....	6 cents.
$\frac{1}{2}$ -pound papers.....	3 cents.
1-pound papers and larger.....	2 cents.
Nails in bulk in wooden boxes.....	1 cent.

These extras to be added to the list before taking off the discount. It was also decided that Nails provided for in the price list of Standard Wire Nails in kegs should not be sold at a discount from the miscellaneous list. It was understood that these changes should go into effect when the Standard card was issued, and now that it has been issued some of the leading Western manufacturers have agreed to be governed by and to announce these provisions.

Miscellaneous Prices.

Shepard Hardware Company, Buffalo, N. Y., have issued a circular giving the following discounts for Surface Blind Hinges and Gate Hinges and Latches:

	Per cent.
Blind Hinges.....	discount.
Gate Hinges and Latches.....	75&10&5

Their assortment of Blind Hinges includes: Shepard's, Noiseless, Niagara, Buffalo, Champion, Steamboat, Clark's (old pattern) and Clark's (tip pattern). The price list is also announced as follows:

	Per dozen
Nos. 1, 10, 30, 50 and 75 (Wood).....	sets.
No. 3 (Brick).....	\$3.50
No. 5 (Brick).....	6.25
No. 60, "Noiseless" (Brick).....	12.50
No. 65, "Noiseless" (Brick).....	6.25
No. 55, "Noiseless" (extra heavy).....	7.00
	15.00

The market for Tire Bolts is somewhat irregular. The base discount of the Port

Chester Bolt and Nut Company and the American Screw Company is 70 per cent., but some of the other manufacturers are still adhering to discount 65 and 10 as the base discount.

The following quotations on Hammers are made by the Hartford Hammer Company, Hartford, Conn., for whom John H. Graham & Co., 113 Chambers street, New York, are agents. The list prices are, it will be remembered, different from those of other manufacturers:

	Dis. per cent.
Adze-Eye Nail Hammers.....	33 $\frac{1}{2}$ &5
Patent Nail-Holding Hammers.....	33 $\frac{1}{2}$ &5
Workman Adze-Eye Nail Hammers.....	33 $\frac{1}{2}$ &5
Workman Adze-Eye Bell-Face Hammers.....	33 $\frac{1}{2}$ &5
Standard Adze-Eye Hammers.....	33 $\frac{1}{2}$ &5
Machinists' Adze-Eye Ball-Pein Hammers.....	50
Machinists' Adze-Eye Straight-Pein Hammers.....	50
Riveting Adze-Eye Hammers.....	50
Farriers' Adze-Eye Hammers.....	50
Horseshoers' Adze-Eye Fitting Hammers.....	50
Horseshoers' Turning Hammers.....	50
Tinners' Riveting Hammers.....	50
Tinners' Panning Hammers.....	50
Riveting Plain-Eye Hammers.....	50
Engineers' Single-Face Hammers.....	50
Engineers' Double-Face Hammers.....	50
Blacksmiths' Hand Hammers.....	50
Coopers' Hammers.....	50
Carriage Ironers' Hand Hammers.....	50
Chipping Hammers.....	50
Machinists' Ball-Pein Octagon Pattern Hammers.....	50
Machinists' Straight-Pein Octagon Pattern Hammers.....	50
Machinists' Cross-Pein Octagon Pattern Hammers.....	50
Brad Hammers.....	50
Tack Hammers.....	50
Boilermakers' Riveting Hammers.....	50
Drilling or Striking Hammers.....	50
Hand Drill or Stonecutters' Hammers.....	50
Masons' Hammers.....	50
Masons' Hammers with teeth.....	50
Napping Hammers.....	50
Tack Claws.....	25
Spalling or Stone Hammers.....	65&10
Blacksmiths' Hand Hammers.....	65&10
Blacksmiths' Sledges.....	65&10
Coal Sledges.....	65&10
Horseshoers' Turning Sledges.....	65&10
Stone Sledges.....	65&10
Stone Axes.....	65&10
Railroad Mauls.....	65&10
Ship or Top Mauls.....	65&10
Woodchoppers' Mauls.....	65&10
Wedges, Truckee Pattern.....	65&10
Wedges, Hartford Hammer Company's Pattern.....	65&10
Railroad Track Chisels.....	65&10
Handles.....	25

The agreement among the manufacturers of Wire goods has, with some modifications, been continued. Materially lower prices are, however, prevailing, and discount 85 per cent. is mentioned as a general quotation. At figures which are obtainable by good buyers, this line of goods is regarded as a safe purchase, as the goods are not likely to go much lower, and, with the understanding which exists among the manufacturers, may perhaps be advanced in price before very long.

Heavy Hammers and Sledges are sold at low and irregular prices. Competition is animated, and the situation is not regarded by the manufacturers with especial satisfaction.

Picks and Mattocks are also offered at low prices, some of the leading manufacturers having made recent concessions.

The Daisy Wagon Jack, manufactured by the E. Covert Mfg. Company, Farmer Village, N. Y., is sold at \$4 per dozen, subject to a discount of 35 per cent.

A meeting of the manufacturers of Table Cutlery was held in this city last week, and was attended by representatives from the leading companies. The matter of prices was considered, and it was decided inadvisable to make any change at present, existing quotations being reaffirmed. The condition of things in this line is more satisfactory than it has been for some time, prices being well maintained.

Wrought-Iron Pipe is in better condition than at our last report, in which we referred to the fact that the market showed no further yielding in price, and alluded to the probability that better figures would soon prevail. The improved condition is owing largely to extensive purchases of Pipe, so that many of the mills are well occupied with orders, and show a disposition to refuse others except at advanced quotations. The activity which has characterized the market still continues. The following prices are those at present prevailing:

	Discount.
	per cent.
1 $\frac{1}{2}$ and under, plain.....	57 $\frac{1}{2}$
1 $\frac{1}{2}$ and under, galvanized.....	47 $\frac{1}{2}$
1 $\frac{1}{2}$ and over, plain.....	67 $\frac{1}{2}$
1 $\frac{1}{2}$ and over, galvanized.....	52 $\frac{1}{2}$
Boiler Tubes, Iron.....	55

Since our last reference to the Cordage market Sisal Rope has been vacillating, a decline of $\frac{1}{4}$ cent having occurred, followed, however, by an almost immediate recovery of $\frac{1}{4}$ cent, so that the price remains where it was. The market continues firm, especially in view of the marked stiffness in the price of Manila Rope.

The Screw market, notwithstanding the fact that some orders have been placed at slight concessions beyond what is regarded as the extreme price, continues decidedly firm, the agreement of the leading manufacturers working satisfactorily in the regulation of the price. While these goods are thus held firmly at a large advance beyond prices which prevailed in the days of active competition between the companies, it is to be noticed that a similar condition of things prevails abroad. Recent London advices are to the effect that the makers of Iron and Wood Screws have combined to raise their price about 60 per cent. on the net value, and to divide the field, leaving the home trade exclusively to Messrs. Nettlefold, and the German home trade to the German makers, while extra-European markets are to be supplied at 72 $\frac{1}{2}$ per cent. discount from Nettlefold's list. This is referred to as an exceptionally strong combination, which was effected with so much secrecy that speculators did not succeed in placing orders before its accomplishment, thus leaving them in a position where they cannot compete with the syndicate.

Ammunition.

Recent inquiries among the trade through the country at large develop the fact that a comparatively small proportion of the merchants pay the regular prices for Ammunition, cuts direct or indirect being exceedingly frequent. This irregularity is not confined to the houses who have openly announced cut prices, but in a quiet way extras are given by many who are compelled to adopt this course in order to meet the prices quoted by their competitors and thus hold their trade, or who make these concessions as inducements for the purchase of other goods. To such an extent does this condition of things prevail that the associated manufacturers will be obliged to take cognizance of it, or to lose such control of the market as they still retain, there being danger of an increase in this irregularity with the open announcement of cut prices by the E. C. Meacham Arms Company, Alford & Berkeley Company, McIntosh, Huntington & Co. and other houses. The association are, however, apparently reluctant to take action in the premises, as the irregularities in question are so widely practiced, and by some houses of such influence, that an attempt to enforce strict adherence to prices would be liable to precipitate a rupture which would still further embarrass them. It remains to be seen whether they will permit this state of things to continue with only mild pro-

test, which would probably be without result, or will take active measures to enforce adherence to schedule prices, and cut off the supply of any houses by whom cut prices are made. The latter course in existing circumstances is not regarded as likely to be adopted at all generally. In the meantime the houses not connected with the association are understood to be obtaining such Cartridges as they need without any special difficulty, and it is stated by some of them that since the Meacham break they have been able to procure a supply of the goods more easily than before, notwithstanding the strenuous efforts, to which we alluded in our last issue, as made by the association to prevent this. There is some disposition among "A" houses to withdraw from the association in view of the advantages they can obtain in buying and selling the goods in the open market, but as yet there has been little movement in this direction. As bearing upon this aspect of the case, we give the following extract from a letter received from a well-known Western house:

On January 1, 1888, we concluded that our interests would be better served by not buying Ammunition of the association, and the result has more than justified our judgment in the matter. We have had no difficulty in buying all the Ammunition we needed at better advantage than we could have bought of the association, and selling it at what prices we chose to make. As you are aware, the cuts are made openly and not *sub rosa* at all, and in addition to these open quotations we have numerous confidential letters naming association prices and lower. We do not think that the association amounts to a row of pins.

While there is no doubt more vitality in the association than our correspondent regards it as possessing, it is still true that the irregularity of the market and the facility with which goods are obtained indirectly, are represented in the above letter.

Items.

Wm. G. Hibbard, president of Hibbard, Spencer, Bartlett & Co., Chicago, sailed for Europe on the 7th inst. from New York. He expects to be absent for several months.

A change has been made in the membership and name of the well-known house of Ducharme, Fletcher & Co., Detroit, Mich. They are succeeded by Fletcher, Jenks & Co., J. A. Whitney having been admitted as a partner in the firm. With this exception, the persons comprising the new firm are the same as those of Ducharme, Fletcher & Co.

At their recent annual meeting we are advised that the Louis Hoffman Hardware Company, Vicksburg, Miss., declared a handsome dividend. The old officers were re-elected. The company's increasing business is referred to with the expectation that they will do a still larger business the coming year.

A considerable departure from the usual line of goods advertised in *The Iron Age* is the card of C. Ehman, manufacturer of Wood Mantels, Elizabeth and Fulton streets, Chicago, which will be found on page 49 of this issue. Mr. Ehman is a very enterprising manufacturer of Mantels, his stock comprising over 300 separate designs, of which the photographs alone have cost \$7000. As he finds his patronage is growing among dealers in Hardware he seeks through this advertisement to extend his acquaintance and increase his trade. It is not unusual in some localities to find Hardware merchants fitting up small apartments with artistic Grates, ornamental Wood Mantels, fancy Chandeliers and other pieces of furniture from their stock to show customers how nicely—and possibly how cheaply—they can fit up parlors, libraries and sit-

ting-rooms, according to the most modern ideas in household decoration.

The Chicago papers contain a great deal of news about Saturday afternoon baseball games, in which very familiar names frequently figure. One issue recently reported contests between the Horton, Gilmore, McWilliams & Co.'s nine and the W. W. Kimball & Co.'s nine; the Crane Bros. Mfg. Company's nine and the Crane Elevator Company's nine; the Wells & Nellegar nine and the Mayflowers; Markey, Alling & Co.'s nine and the Wanderers. Much interest is being taken in these contests, and the half holiday is looked forward to with eagerness by not only those who play, but their associates in their respective business houses, who take a deep interest in the result. The business of the week is dispatched with more than the usual celerity, so that the decks are kept clear for Saturday.

J. B. Field & Co., Detroit, Mich., show a large line of Sporting Goods in their pamphlet devoted to summer sports. Copious illustrations are given representing leading goods in the lines indicated. Their factory is referred to as equipped with electric power and machinery for manufacturing Split Bamboo Fishing Rods, Sporting Specialties and general Gun and Fishing Tackle repairs. The catalogue will be appreciated by those who desire information on the interesting and varied line to which it refers.

Goulds & Austin, Chicago, Ill., have issued a handsome pamphlet devoted to Well Sinking Machinery, to the exhibition of which 100 pages are given. There is thus offered to those interested in this line a very complete catalogue elegantly printed on heavy paper of superior quality and containing a large number of illustrations, many of which are new. The chapter devoted to Pole Tools is especially referred to as containing the only full line of illustrations on this subject published. These Pole Tools are used for deep drilling instead of the cable outfits used in Pennsylvania and the East. But the catalogue contains a large amount of valuable and interesting matter showing the methods and machinery used in this important industry.

The advertisement of William A. Ives & Co., on page 46 will be observed. It will be seen that they announce change of address from New Haven, Conn., to Hamden, Conn., where their factory is situated. It is also stated that their New York agency has been discontinued.

In a game of base-ball played at Communipaw, N. J., July 7, between the nine of the H. B. Newhall Company and the nine of Topping & Fox, the former were defeated by a score of 21 to 13.

Watkins, Pease & Co., of Chicago and Columbus, Ohio, have opened a branch house in Louisville, Ky., where they carry a full line of Builders' Material, such as Doors, Sash, Blinds, &c. They are said to represent two of the largest manufacturers in the Northwest.

The Hollow Cable Mfg. Company, Hornellsville, N. Y., are erecting a new two-story brick factory, 150 x 40, which they will fill with machinery for the manufacture of their goods. It is located adjacent to the tracks of the Erie Railway. The company report a large trade this season in their Hollow Cable Clothes Lines, of which they make four sizes, and in their Preston's Patent Braided Barblless Fence Wire. The demand for the latter is referred to as increasing very rapidly, and although the company have been running their works day and night for more than three months they are still behind their orders.

W. C. Smith, secretary and treasurer of the Rockford Bit Company, Rockford, Ill., having recently purchased R. H. Tinker's stock, has become sole proprietor. The company have lately bought the Ashtabula Bit Works, the two establishments being thus consolidated. Since then Mr. Smith has been considering the advisability of using natural gas, and in view of the advantages resulting from its use has decided to move the works from Rockford, Ill., and Ashtabula, Ohio, to Kokomo, Ind., where the company are now building factory, storerooms, office, &c. It is intimated that when the new works are completed the company will have a very convenient and well arranged factory. The use of natural gas is referred to as enabling them to produce goods of exceptional quality. With the increased facilities thus given they will continue the manufacture on a larger scale than heretofore of their Perfection Auger Bits, Special Wood Boring Tools, Machine Bits, &c.

The catalogue of the Westcott Chuck Company, Oneida, N. Y., illustrates Westcott's Patent Chucks, which include two styles of Drill Chucks, Little Giant Improved, of which seven sizes are made, and Oneida, of which two sizes are made, and also five styles of Lathe Chucks, as follows: Scroll Combination, ten sizes; Geared Combination, eight sizes; Plain Universal, eight sizes; Independent, seven sizes, and Cutting Off, seven sizes. The pamphlet is finely printed and fully illustrated.

The Palmer Mfg. Company, 290 Pearl street, New York, issue a convenient price list of Stove Boards, including the Pearl Embossed White Metal, paper and wood lined; Seamless Oxidized Crystal, paper and wood lined; Peerless Embossed White Metal, with figured brass border and corners, paper lined; Perfection Embossed Brass, figured corners, wood lined, and Star, paper lined, zinc polished. They also issue a separate price list of new Oxidized Zinc Stove Boards, paper and wood lined, and give an illustration showing the character of the decoration.

W. K. Morison & Co., Incorporated, who will, August 1, succeed Janney, Sample & Co., 107 Nicollet avenue, Minneapolis, Minn., in their retail Hardware business, would like to receive catalogues-discount sheets and quotations from manufacturers. Material improvements will be made in the interior arrangements of the store, and they hope to retain the large retail business which is already established there. The location is regarded as a good one, having been used as a Hardware store since 1866.

Condition of Trade.

We have the following advices in regard to the condition of business in Louisville, Ky:

The Hardware trade of Louisville, Ky., is in a healthy state, naturally quiet, as no one is making efforts to push sales. The farmers are busy attending to good crops, having no time for improvements, and consequently the country merchant has a dull time, which the jobbers feel. The salesmen are all called in, enjoying a needed rest. Building in towns goes on well—far beyond last year—while the trade in Harvesting Machinery was never so large. At last heavy rains have fallen, giving general relief, particularly to the tobacco crop, which was given up as a failure. Dealers, while still extremely conservative in buying, are careful to keep stocks full, with placed orders to draw from, firmly believing a good trade is coming soon again.

The following review of the Pittsburgh Hardware market is given by the *Dispatch*, of that city:

The year's business in Hardware closes up in the early part of July. Taking the country over, the trade shows a falling off according to the uniform testimony from all directions as compared with the previous season. Pittsburgh's trade in the line of this industry has been exceptional the past year. Interviews

with a number of the heavy operators in this line lead to the conclusion that the volume of business for 1887-8 has been up to the previous year, while the margin of profits has been reduced to a minimum. One heavy jobber says his trade has increased 25 per cent., but profits are below all former years. Another who has known the trade here almost from the beginning claims that the business will this year fall slightly below the average of the past two or three years, but says he is not disappointed, as tariff uncertainties and the excitement of the political campaign never fail to damage more or less the Hardware industry. All, however, agree that this city has suffered less from the general depression than any trade center on the continent. To hold our own after the prosperity of 1886-7 is glory enough, and few, if any, cities of the land have done this much, as Pittsburgh undoubtedly has in the line of Hardware. Investments in Nail mill plants have in the past two years been nearer zero as to value than at any period since Nails were made by machinery. The present situation of the Pittsburgh Hardware industry is in brief as follows: The volume of business for the year just closing has been equal to any previous year. Tariff uncertainties and the Presidential campaign have without a doubt brought the volume of trade for the year below what it might have been. But all in all the business has been up to the average of the past three years, and in some lines much better. Dealers generally are satisfied and hopeful. The depressed trade in Hardware through the country has affected Pittsburgh less than any other trade during the first half of 1888, and the outlook for the new season's business is as fair as the average at this time, which is called the winding up period for the year's trade and the time of planning for new ventures.

Arrangement of Stores.

We have received from A. L. Young, Sing Sing, N. Y., a description of two or three racks which are in use in his store, the

Fig. 248.—Stove-Board Rack.

first of which, a Stove Board rack, is illustrated in Fig. 248. This rack is made of $\frac{1}{4}$ -inch stuff, and is divided into compartments for holding the different sizes of Round and Square Stove Boards. These compartments are inclosed on three sides, the front being open to permit the insertion of the Boards. The Boards rest on shelves 3 inches apart, the largest being placed at the bottom, as indicated in the illustration. This rack is referred to as keeping the Boards in good shape, as they lie flat on the shelves, thus overcoming the tendency to curl up, as is the case when they stand on edge. The fact that the stock is to a great extent protected from dust is also emphasized, as well as the general utility of the arrangement.

In Fig. 249 we illustrate Mr. Young's arrangement for the accommodation of Picks, Axes, Handles, Feather Dusters, Curry Combs, &c. In this method of handling the goods large deep drawers are used in the manner indicated in the engraving. Axe boxes are utilized as drawers in the first or lower row, four

heavy iron trunk rollers being employed on each drawer to facilitate removal. Handled Axes and Picks are thus kept. The second, third and fourth rows of the arrangement above are 34 inches in length, thus leaving a ledge of 4 inches above the lower row. The drawers comprising the

Fig. 249.—Drawers and Shelving.

first two rows are 6 x 9 $\frac{1}{4}$ inches, the others being of varying dimensions. These drawers are used for the goods indicated in the illustration, the upper row being entirely devoted to Feather Dusters. The top of this upper row corresponds with the counter level, and in the shelving there are drawers, riding on four small trunk rollers, for Curry Combs and Brushes. Wire, Finishing and Clout Nails are kept in smaller drawers, each size by itself, and large enough to hold 20 to 25 pounds each. The shelf stock is kept in conventional wooden boxes with Russell & Erwin's Sash Lifts or Pulls No. 8026—a simple open loop fastening with a screw at each end—an article which is much approved by Mr. Young for this purpose. He states that he has used over 1200 of them in refitting his store.

Fig. 250 represents his rack for Pot Covers, which is made very much on the same principle as the one described above, Fig. 248. This rack is divided by a partition down the middle, each side being 13 inches wide at the bottom and 36 inches high, and having 10 shelves each 3 inches apart. The sides of this rack are made of $\frac{1}{4}$ -inch stuff,

Fig. 250.—Pot-Cover Rack.

$\frac{1}{4}$ -inch material being used in the construction of its other parts. This rack accommodates the sizes of Pot Covers between 7 $\frac{1}{4}$ and 13 inches, those which measure an even number of inches being kept on one side and all others on the other side. The adaptability of this rack for the purpose for which it is intended is obvious.

R. T. Young, of Tuckahoe, N. Y., sends us a description of his method of keeping list for retailing Carriage Bolts and other goods, an illustration of which

Fig. 251.—Price Card for Bolts, Screws and Hinges.

is given in Fig. 251. Two stiff paste-boards are united by a flexible leather back, the size of which is 12 x 18 inches. This is to protect from dust and dirt. The first inside page is divided into four columns for the different kinds of Bolts. This will contain prices of Bolts in sufficient variety. One of the four columns is thus arranged:

Box.	Carriage Bolts.	Price.
1	$\frac{1}{4}$ x 3.....	\$8.00
2	$\frac{1}{4}$ x 4.....	8.80
3	$\frac{1}{4}$ x 5.....	9.60
4	$\frac{1}{4}$ x 6.....	10.40

The boxes containing the Bolts are comparatively numbered and arranged consecutively, size proportioned, and divided

Fig. 252.—Brackets for Steel Goods.

to contain one or more packages of Bolts. The size of box, 12 x 9 x 6, is a good one, but Horse Nail boxes make a very good substitute. To avoid mixture it is suggested that in arranging the Bolts the kinds of each box should be as different as may be convenient. This method is referred to as making it as easy to find a

Fig. 253.—Details of Bracket for D-Handle Goods.

Bolt of any specified size as to locate an account in the ledger by the aid of an index. It is also pointed out that deficiencies of samples are readily detected. The other inside page of the price card is used for all kinds of Hinges, and between these pages is interleaved the Screw list, as shown in the illustration.

F. S. Widenor, Belvidere, N. J., sends us a description of his method of making Brackets for Shovels, Forks, Rakes, Hoes, Handled Axes, &c., which is illustrated in Fig. 252. The Brackets, which are 2 $\frac{1}{4}$ inches apart, are sawed out of $\frac{1}{4}$ -inch cherry, and are supported by 7 x 9 Rosette

Brackets, the shorter side of which is screwed to the wall. The distance between Brackets is ample to admit handles. By this method a large stock of the goods is satisfactorily accommodated. Mr. Widenor alludes to the convenience and efficiency of this arrangement, and states that the cost of these Brackets complete does not exceed \$3 per dozen pairs.

The details of Bracket for D-Handle Forks and Shovels are shown in Fig. 252. For accommodating long handle goods the Brackets are made with eight places instead of six, as shown.

Referring to another feature of his arrangement Mr. Widenor writes:

I find the use in my store of Spool Cases or Cabinets to be very advantageous. They can be bought of any dry goods house for from 50 cents to \$2 each, according to the number of drawers in them. I have in use 12 of these cases, and find that with a little alteration of the partitions they are very convenient. I use one case with two drawers, one for narrow Wrought Butts and another for Brass Butts. When I have a customer for any of these goods I pull out the drawer, and he sees at a glance the different sizes, and I am thus saved the trouble of taking down eight or ten small broken boxes and replacing them after the customer has purchased. Another cabinet of two drawers I use for Bright Auger Bits. One of four drawers is devoted to Black Auger Bits, Twist Drills, &c.: Black Auger Bits, two drawers; Morse Twist Drills, one drawer, while the other drawer is occupied by Nail Sets, Reamers, Punches, Countersinks, &c. Another cabinet of three drawers is used as follows: One drawer, Keys, all kinds, each in a separate place; one drawer, Screw Eyes in the front part and Springs and Rivets in the back. The third drawer is occupied by Copper Rivets and Burrs in the front, and Tinned Iron Rivets and Burrs in the back. A cabinet of four drawers is devoted to Bright and Black Augers, to each of which two drawers are given. Plane Bits and Gouges, each one drawer, occupy another cabinet, and Jennings' Auger Bits, Syracuse Twist Drill Bits for wood and German Gimlet Bits are accommodated in another three-drawer cabinet. I use one cabinet with two drawers for Fish Hooks in boxes, and two cabinets for Fish Hooks tied to gut. Brass Fishing Pole Ferrules occupy another. Before adopting this method of arrangement I found it very inconvenient to show the goods mentioned, but now the whole stock is readily placed before the customer. Another advantage is that in ordering any of these goods you can see at a glance just what you have in stock, and by marking numbers, &c., on the partition, you know just what to order.

Show Window Decoration.

A correspondent, writing from Boston in regard to this matter, says: "It is a good plan to advertise one's business in the papers, but for all of that the windows should be so arranged that the customer will find the store without asking half a dozen people where it is. A little study and some originality will accomplish wonders. For instance, fill the window with stove-pipe, and hang on a card with this notice:

"YOU DO NOT HAVE FITS WHEN
YOU PUT OUR STOVE-PIPE TO-
GETHER, AS IT'S THE PIPE THAT
HAS THE 'FITS.'"

There would be little use in having the card and pipe in the window for a decade—a week would be long enough. If the boys in the shop have some spare time, a collection of tin cups could be made, from as small as the tinner can make to one of Jumbo size. These cups being arranged in their proper order, will be sure to attract attention. A small cook stove could be put in the window, and everything arranged as though the window was a kitchen. If the figure of a woman could be secured, and this supposed person be

made to appear to be engaged in cooking, there would surely be a crowd in front of the store for days together.

After the tin cups have ceased to be a novelty, some other article of tinware could be selected for similar display. Almost every tin shop has wash boilers from 7 to 10 inches. By making two or three smaller sizes of boilers, and putting the collection in the show window, the desired effect will be certain to be produced using this article. The large dry goods stores have men called window dressers, whose business it is to arrange the show windows, and the passer-by each day observes a new display. Not only that, but the windows are often kept lighted after the store is closed, so those who pass can see what is to be shown. Similar ideas will pay in the stove and hardware line.

The Price of Stoves.

Relating to this matter a recent issue of *The Metal Worker* says:

A correspondent in the Southwest, whom we know to be a careful and regular reader of this paper, in a letter to the Editor not intended for publication, asks some questions about the selling price of stoves that would seem appropriate for discussion in this column. We think we violate no confidence in explaining why we allude to the subject at this time, nor yet in referring directly to portions of his letter. What he asks is perhaps in the minds of other dealers, and portions of what we have said to him in the reply we have sent may therefore be of benefit in various directions. Without quoting the letter we may say that our correspondent has in mind that stove castings can be made at present for about 3 cents per pound, while stove manufacturers want from 6 to 7 cents per pound for the goods they have to sell. He argues that with a cast so low and a price so high, relatively, something must be wrong, but rather than charge the manufacturers with an unreasonable profit in a way to do them injustice he comes first to us to ask a little information.

The reason that stoves are not sold as low as our correspondent thinks would be proper, in view of the cost figures he has secured, is primarily because his cost figures are erroneous. The cost of stoves at the present time is not the same as the cost of castings, but a much higher figure. The castings are only one of several items entering into the finished stove. Before the castings are made there is the heavy item of design and patterns, and as a part of the cost of almost every modern stove is a royalty on one or more improvements in construction. The foundry cost alone, which the figure quoted represents, is estimated by some well-informed persons to be less than half of the cost of the stove when sold and ready to ship. Assuming this to be even approximately true it would make the price of stoves at the present time low, rather than much too high. This in a nut-shell is the reply to our correspondent's inquiry, although the same idea is capable of presentation in different forms and from other standpoints.

We believe the prices demanded by stove manufacturers at the present time to be low rather than unreasonably high, and that makers in general have reason to feel that they are entitled to more than they are now getting. The efforts that are being made by stove manufacturers to secure better prices through the medium of agreements, &c., are based not upon inordinate greed, but rather upon a reasonable desire to get a fair price for certain goods which competition has put at figures too low to be remunerative. These general remarks are perhaps not called for by anything in the letter above referred to, but as they express the truth as we see it we offer them

for the consideration of our readers. When conditions change and prices are fixed at a figure unreasonably high we shall have something to say on the other side.

Uniformity in Marking Goods.

The following letter from a correspondent in Brooklyn has been called out by the article which appeared under the above title in the last issue of *The Iron Age*. The writer treats the subject from a little different standpoint than the correspondent whose letter has already appeared, and presents a record of experience which will be found of interest to many in the trade. He says:

To the Editor: I notice the article entitled "Uniformity in Marking Goods," signed by "Veteran." The idea of the correspondent is, in my opinion, a good one, and is the proper way to mark regular goods, but it will not work in all cases. There are at present a great many goods sold at auction, and I frequently make purchases on such occasions. From the number of people present, and the quantity of goods sold, I am satisfied that the auction is not held especially for my benefit. From long experience in business I have learned that it is possible to charge too little as well as too much for goods. To illustrate, suppose I go to the auction and purchase a few gross, more or less, of all-bristle scrub brushes at 7 cents each. These are worth in a regular way \$3 a dozen. I put them in a basket at the door and mark them, "All-bristle scrubs, only 10 cents; worth 35 cents." At that figure there would be a fair profit; but I might just as well put out gold dollars and mark them 25 cents each. People look at them, put them down with a wise look on their face, as much as to say, "you can't fool me," and pass on. Now, my plan to sell the goods above mentioned is to mark them 25 cents. The man down the street charges 35 cents for his; you cut his prices, and that is all you want to do. I purchased some shears a short time since, with 8 inch straight cutter steel blades, for 10 cents each. It was impossible for me to sell them until I had put the price up to 40 cents; then people believed what I said concerning them, and I soon disposed of the lot. I tried them first at 15 cents and then raised the figure to 25 cents, but they would not sell. At 15 cents people seemed to doubt my word concerning the quality of the shears. I believe in selling cheap, and make it a rule to sell all regular goods at a uniform profit of 25 per cent., except it be something like stoves, that require a great deal of extra time and trouble. Upon that class of goods I get all I can, and then, occasionally, am not half paid for the trouble. I purchased some time ago about 250 odorless cooking pots, 7 and 8 inch, at 16 cents. I put a cover on them and sold them at 50 cents and 75 cents each. They were disposed of very rapidly, and I could have sold as many more if I had them. If I had put the price at a less figure, which I could easily have afforded to do, people would have thought they were too cheap to be good, that they were made of poor iron, would black the food, or something else was the matter with them, when the fact was they were first-class goods in every particular.

SHARP BUYER.

The letter of our correspondent is interesting and instructive as throwing some light upon the methods at present in vogue in the retail trade in some sections of the country. No doubt there are those who follow a different plan from that outlined, a description of which would add to the general discussion of an interesting subject, and from them we invite an expression of opinion.

Speed of Electricity.—According to Professor Gould's investigations on the speed of electricity, it appears that aerial telegraph wires on poles transmit electricity at the rate of from 14,000 to 16,000 miles per second, and that the velocity of the transmission increases with the distance between the wires and the earth—or, in other words, with the height of suspension; and that the subterranean wires, like submarine cables, transmit with reduced rapidity. Again, while wires suspended at a feeble height are known to transmit signals at a velocity of some 12,000 miles per second; those that are suspended higher give a velocity of 16,000 to 24,000 miles.

The Peerless Register.

By means of the accompanying illustrations we show a combined register border and box which is being offered to the trade by Messrs. Tallmage Bros., of 80 and 82 Seneca street, Buffalo, N. Y. Fig. 1 of the engravings represents a floor register, while Fig. 2 is an illustration of a register intended for use in the wall of a room. The floor register consists of

Fig. 1.—The Peerless Floor Register.

a face and border in one plate, together with a box, the sides of which are made of tin. The sides connect with a cast-iron plate, which forms the bottom of the box, on which is a collar for the purpose of connection with the hot-air pipe leading from the furnace. In place of the fans or wings ordinarily employed for shutting off the heat a damper is placed in the collar at the bottom of the box and connected by an arm with a slide in the register face. This permits the damper to be easily operated, and retains it in the position in which it may be placed. The tin box is made of IX bright tin in four pieces. The device is so made as to be readily taken apart and packed in small space for shipment without liability of breakage. The damper above referred to is located about 7 inches below the floor, and is so disposed as to reduce the liability to fire from an overheated register to a minimum. The entire register is held by two bolts, and can be readily put together. The side wall register, shown in Fig. 2 of the illustrations, is one of the same general design as the floor register just described. Its construction is such as to admit of its

Fig. 2.—View of Side Wall Register.

being used in partitions made from 3-inch studding and upward without obstruction to the free passage of air. In this register the cast-iron plate forming the bottom of the box is turned at right angles to the face. The collar in this instance is made oval to fit the standard sizes of oval pipe. The operation of the damper in this register is the same as in the one already de-

scribed. The company state that this register can be advantageously employed on the second floor, as the oval pipe can be continued to the register, thus giving an opportunity to start from the wall pipe at the lowest point possible and connect with the register close up to the floor, thereby allowing an elevation between the air-pipe and register of the full width of the joist. The opening in the face of the register is fully one-sixth more than the capacity of the collar, thus allowing of a free circulation of air. The company make a departure in listing their registers, and indicate their various sizes by numbers, which number represents the size of the collar. These registers are made under the personal supervision of the inventor, H. K. Tallmage, and are fully covered by letters patent.

Sheet-Metal Lamp Shade.

A correspondent gives the following description of a sheet-metal lamp shade: For a number of years the writer has used a kerosene lamp and during the time has tried various kinds of shade. With every shade tried one difficulty was experienced, and that was that the heat from the chimney made the head hot, and what heat came from the chimney was apt to strike the eyes or cause double shadows. When drawing is to be done by lamp light one set of

Sheet-Metal Lamp Shade.

shadows is enough. The shade shown in the accompanying sketch can be made of light-gauge galvanized iron, and, if colored blue inside, will be so much the better. The upright part A can be made such size as the lamp chimney may require, the object being to extend the tube about to the top of the chimney of the lamp. The reflector B can be made as indicated in the drawing. Those who are accustomed to working by lamp light and have used the ordinary shades that are to be purchased at the stores have no idea how their eyes will appreciate a lamp shade that will throw the light just where it is required and no where else. While the drawing illustrates a shade adapted to a student's lamp, the shape of shade can be made to suit any kind of lamp.

An account given by the *Railroad Gazette* of the successful use of a device for scraping sand off the rails behind the locomotive, states "that 20 cars could be drawn up a given grade when the device was in use, and only 18 when the sand was al-

lowed as usual to lie on the rails. This may be taken as proving that the presence of crushed sand on the rail increases the resistance of the train, and that this sand can be removed by the use of a sweeper. Experience alone can show whether the steel brushes used will be durable."

Clewell's Patent Ice-Cream Dish and Measure.

At various times in the past, we have received inquiries from correspondents relative to devices designed to assist the

Fig. 1.—The Clewell Ice-Cream Dish.

confectioner in advantageously dispensing ice-cream. By means of the accompanying illustrations, we present for the consideration of our readers two views of articles designed to meet the requirements of the retail ice-cream trade, manufactured by Valentine Clad, of Philadelphia, Pa. Fig. 1 of the illustrations shows a perspective view of what is known as the Clewell patent ice-cream dish, the construction of which is clearly indicated in the engraving. It is made with two revolving knives which cut the cream loose, allowing it to slip out without loss of time. At the bottom of the dish will be noticed a button, the object of which is to revolve the knives. The manufacturer states that the device works equally well with soft or hard cream, with mixed or plain cream, and that it takes less time to serve the cream than with a spoon. It is made extra strong and in five standard sizes, holding regulated amounts to the quart.

Fig. 2.—The Clewell Ice-Cream Measure.

In Fig. 2 of the engravings is shown an ice-cream measure, constructed upon the same general principle as the article just described. The engraving presented herewith shows a side of the measure broken away, revealing both the button and the revolving knives. The manufacturer states that by the use of these articles, the confectioner can rapidly measure his cream and remove it from the vessel, and that they are well calculated to prevent the loss of patience, especially when the store is crowded with customers all anxious to be served. It is stated that by the use of the ice-cream measure here shown, orders can be filled in one-quarter the time occupied when the old-fashioned ice-cream measure employed.

Perfect Postal Packages.

The Postal Package Company, Baltimore, Md., are manufacturing a package for mailing liquids, oils, syrups and such similar goods, which is designated as above and represented in the illustration given herewith. It consists of a tin box lined

The Perfect Postal Package.

with a wooden tube to prevent the tin from being crushed by the weight of mail matter and to protect the glass from breakage. The wooden tubes are lined with heavy absorbent material, which, should breakage of the glass occur, will absorb the liquid and prevent damage to extraneous objects. This form is put upon the market as an improvement upon that previously made by the company, a square block with tin inside, and is called their Improved 1888 Perfect Postal Package. It is alluded to as stronger, lighter, cheaper and more compact. The packages have, it will be observed, a screw top, permitting them to be easily opened and closed. The tin case is referred to as absolutely oil and water proof. A large variety of patterns and sizes are announced, and other similar cans made by the company. In their circular they give the following extract from regulations of the Universal Postal Union, which indicate the requirements of the Post Office in regard to mailing liquids, &c.: "Samples of liquids, fatty substances and powders, whether coloring or not (except such as are dangerous, inflammable, explosive or exhale a bad odor) are admitted to the mails exchanged between the United States and those foreign countries which admit such samples to the mails they exchange with other countries of the Universal Postal Union, provided said samples conform to the following conditions—viz.: They must be placed in thick glass bottles, hermetically sealed; the bottles must be placed in a wooden box containing sufficient spongy matter to absorb the contents if bottle should break. The whole to be inclosed in an outside metal case bearing the address. The wooden box and outside case must be closed so they may be easily opened for examination of the contents. The whole package must not exceed in weight 8½ ounces, nor in size 8 x 4 x 2 inches, except those addressed to the Argentine Republic, Belgium, France or Switzerland, which may weigh not to exceed 12 ounces, and measure not to exceed 12 x 8 x 4 inches."

The Kentucky Rock Gas Company, of Louisville, Ky., J. H. Lindberger, president, Major W. J. Davis, manager, are making arrangements to pipe gas to Louisville from their wells in Meade County, situated about 80 miles below the city, on the Ohio River. The fields in which they are boring promise an abundant supply for all requirements of Louisville. They have

no "gushers," but from the wells already sunk there is a steady flow and some have been bored long enough to prove their lasting qualities. There are several companies drilling in Meade County, all of which have been successful in finding gas and the Kentucky Rock Gas Company have completed arrangements to lay the pipe line and purchase the outflow of the other wells, which will be added to their product and carried to the city. They have now, collectively, between 13,000,000 and 14,000,000 cubic feet of gas per day, by actual measurement. This of itself is a good source of revenue, but they expect soon to produce 40,000,000 to 60,000,000 of feet per day and will lay the mains accordingly. The company contemplate being ready to furnish gas to consumers by October.

Clad's Patent Ice-Cream Machine.

This machine is manufactured by Valentine Clad, 117 and 119 South Eleventh street, Philadelphia, Pa. It is shown in the accompanying illustration. This machine is described as possessing features entirely new, and as designed to make a smoother ice-cream than can be made by other machines, and requiring less time and power, and giving a saving of ice and salt over other processes. This machine is made of iron with 44-inch fly-wheel, cedar tub, flat bottom, iron rim, open tin can fitted with adjustable scrapers of special design and with a steel blade, wood handle paddle so arranged as to give a motion the same as beating by hand. In regard to

by the scrapers forcing it to the center, it is taken up by the paddle on a constant and continuous upward movement, and on reaching the top, by the motion is compelled to descend to the sides of can, smoothing every particle in its passage, and preventing stagnation in the center and warmest part of the can, at the same time allowing an expression of air through the cream mixture, by which a lightness exceeding the most skillful paddling is accomplished, at the same time freeing the cream from all obnoxious matters by means of a complete aeration when freezing, it being a well-known fact that cream, however pure is subject to certain fermentations. As the cream thickens on the final beating the paddle is run faster by simple adjustment of the fast gear." The can being open enables the operator to see whether the freezing is progressing properly, and to test the cream at any stage of the process. Its service also in allowing the escape of vapor arising from the cream in the first stages of freezing is also referred to.

Lighting With Magnesium.—According to *Engineering*, there has recently been installed in a brewery at Marbourg a system of lighting with magnesium which is stated to give very satisfactory results. The lamps have been constructed by M. Juss, of Marbourg, and have an intensity of 450 candles, the light being covered with a globe of depolished glass. The light is white in color, very steady, and a single lamp suffices for the lighting of a

Clad's Patent Ice-Cream Machine.

the operation of the machine the manufacturer says: "The process of making cream by our machine is identically the same as making by hand, the cream frozen first and beaten up afterward, the can being rotated in the early and last stages of freezing; the motion of the paddle being suspended, this keeps the cream well cut down and does not froth or churn it. In first beating, by the adjustment of the slow motion of paddle and removing of the frozen cream from the sides of the can

room of 50 feet by 33 feet, in which work of a very delicate nature is not to be performed. A single lamp placed at the front of the building and furnished with a reflector lights up the road for a considerable distance, and completely eclipses neighboring gaslights. The light is, however, much too strong to be employed unshaded for lighting public streets. The price of the lamps is said to be about \$38, and the cost of maintenance about 25 cents per hour.

went into effect on the 10th inst., notwithstanding the intervention of the courts invoked by the railroads. As a consequence, the Dubuque shippers now announce their purpose to prosecute any company making a freight charge in excess of the rate fixed by the Commission-

less \$5000 nor more than \$10,000. The Commissioners may dismiss suits with the consent of the Attorney General of the State. The officers of a railway company making excessive charges may also be indicted and the penalty recovered by criminal prosecution.

ties of water to be utilized are variable, where the height of fall to be utilized is constant and the lower level of water consequently does not rise or vary. A certain number of these turbines has been set up at steel works at Terni, Italy, by the constructors, M. M. J. J. Rieter & Co., of

Winterthur, Switzerland, to furnish the motive power required. These motors work the following machines:

Designation of the machines and apparatus.	Motive power in horse-power.	Quantity of water, liters per second.	Revolutions per minute.	Diameter of the turbines
General rolling mill.	1,000	500	180 to 240	2.400
Mill for rails.....	800	450	200	2.500
Mill for tires.....	500	280	240	1.800
Train of 500 mm. mill	350	200	200	2.500
Train of 280 mm. mill	150	85	250	1.950
Movable crane.....	50	28	850	0.565
Great pump.....	50	28	850	1.070
Great shears.....	40	24	450	1.070
Mill for iron plate....	40	24	450	0.800
Small pump.....	30	17	600	1.070
Small shears.....	20	12	450

The total amount of motive force is equal to 3030 horse-power, and the quantity of water corresponding with this is 1708 liters per second. The turbines of the steel works of Terni may be divided into two principal groups: 1. The small motors of 20 to 50 effective horse-power, which are mounted on a cast-iron frame, and can be removed and attached to the machines to be set in motion as required. 2. The great motors, each placed separately on masonry and concrete foundations.

The engravings which we publish and for which we are indebted to *Les Annales Industrielles*, show one of these great motors. This turbine works a mill for the production of railway rails; its force is equal to 800 horse-power. There are guides bolted on to a large pipe, which is fixed to a solid foundation, and from which a water-pipe branches on the opposite side to the distributing apparatus. This pipe is 600 mm. in diameter inside, and allows for a discharge of 450 liters per second. The head of water is 180 m., equivalent to about 270 pounds on the square inch. In order to resist this great pressure, the

is placed sufficiently above the ground to permit its being easily worked. The motion of this wheel is transmitted by means of bevel gear to a cog-wheel, which is placed in the interior of the sluice, and the advance or recoil of the latter is thus produced. Figs. 4 and 5 represent the sluice and a part of the wheel on a larger scale than that of the whole turbine. The distributing apparatus is furnished with two admission orifices, by which 0.345 m. of water can be introduced. The radial

is quickly stopped and set in motion again. The high pressure brought to bear upon the distributing apparatus would not have permitted this quick arrest and restart without a very complicated disposition of the sluice. For this reason the admission valve is only employed in exceptional cases, and the sluice is worked by means of the wheel previously described, and which can be managed by a single man. But in order to avoid damaging shocks to the pipes when the admission is abruptly

Figs. 4 and 5.—Detail of Guide and Buckets.

VERTICAL TURBINES AT THE TERNI STEEL WORKS, TERNI, ITALY.

thickness of the water-pipe, as well as those of the movable wheel and of the fixed guide-wheel, is considerable. The interior diameter of the movable wheel is 2.5 m., and it makes 200 revolutions per minute, so that it has had to be constructed with great care. Referring to the resistance of the wheel-rim to the centrifugal force which is developed, it should be noted that the cast iron employed for the wheel is very hard; the rim of the wheel is further strengthened by two steel rings welded up and shrunk on. It is united to the boss by a stout disk, so that the whole constitutes a very massive construction. The admission is regulated by a hand-wheel placed suffi-

ciently above the ground to permit its being easily worked. The motion of this wheel is transmitted by means of bevel gear to a cog-wheel, which is placed in the interior of the sluice, and the advance or recoil of the latter is thus produced. Figs. 4 and 5 represent the sluice and a part of the wheel on a larger scale than that of the whole turbine. The distributing apparatus is furnished with two admission orifices, by which 0.345 m. of water can be introduced. The radial

shut off a pipe has been placed in front of the large valve, which contains a smaller one. These two valves are united together by a gearing, so that the opening of the one causes the closing of the other, and *vice versa*, and there is no fear, therefore, of a rupture of the water pipe. The necessary quantity of water to work these turbines is brought by a long canal through two tunnels. The interior diameter of the pipes is 770 mm. The spirit of opposition to all corporate power is seen in the passage by the House of a general land forfeiture bill, as a substitute for one previously passed by the Senate of a less sweeping character.

The Mission of Mechanical Engineering Schools.*

In a paper read last month before the American Society of Mechanical Engineers, one of the members who has practically contributed to the progress of the printing press, presents "A Plea for the Printing Press in Mechanical Engineering Schools." It is an honest plea, courteously uttered, and with an evident desire in no way to disparage the value of the training secured in engineering schools. The writer maintains that while the printing press shares perhaps alike with the steam engine, the fame as a great civilizer, no attention is given to it in any specific way in the leading engineering schools; that no books relating to it are studied or referred to; no lectures delivered detailing its mechanism; that its factories are not inspected by the students, and that no sample machines adorn the schools' laboratories of engineering. All this is inferred by the writer from a perusal of the catalogues. Usually judgment as to the course of studies pursued, if based solely on the catalogues themselves, is a dangerous procedure, apt to lead to fatal errors, but in this case no mistake is made, for it is a fact that the printing press receives but little, if any, attention in the engineering schools.

What should be the relation of the course of study pursued in the schools of mechanical engineering to these ever increasing important industrial engineering applications?

Should every new, important mechanical device, especially if it brings with it new fields of practical employment and labor for the engineer, immediately find its place as a study in the engineering school?

If this be so, the school of mechanical engineering will have to extend its term of study an indefinite extent, and ere long it will come to pass that the young student, entering as a beardless youth, will graduate from the school as a gray-haired man in the decline of life. For, surely, if every important machine is to be the subject of special study in the technical school, a lifetime will only suffice to cover the ground. And the result?

The result would be that the engineering schools would be of no use to the world, for the world's engineering work would be being done by outsiders, while the gray-haired students, plodding along, would be kept busy studying this very work and not be active agents in its development. It is the mission of the technical school to inculcate the principles of engineering, to train and mature the powers of observation and mechanical judgment, and, after teaching the laws of physics and mechanics, to give the ability to apply these laws to problems arising in machinery and the industrial arts. The special machines and appliances dwelt upon in the school should serve this one purpose; a knowledge of them should not be the end, but the means. Because we can best inculcate and supplement a correct understanding of the physical laws and a knowledge of how to apply them to the design of machinery by studying the successful applications made, therefore such study should form an important factor in the course of the technical school.

These engines, motors, machines, factories and engineering works should serve as the constant tests and checks of the student's efforts at individual design. When the student has once acquired the ability to put physical principles and experimental data into the best engineering forms, bearing in mind economy of material, with least sacrifice of strength, best method of handling, management and the like, he

comes equipped to struggle with new machines of which he has had no previous special knowledge. The school cannot give to the student all this desirable latent power, or stored energy, for much of it must come in later life from individual, unaided effort; and the experiences of daily application (often coupled with some degree of failure) must be the teachers which never leave the side of the devotee of engineering science. But these teachers are most efficient, if the student has been trained in the engineering school both and ever to reason before beginning work, and to check his previous reasoning by the results secured.

If we regard the technical school from this aspect, it is plain why the various prime movers play so important an element in the course of instruction, to the disadvantage of other possibly equally important machines. They are the most direct applications of very important and leading laws of physics, and the intelligent discussion of the prime movers calls for quite a knowledge of these laws, both in experimental and mathematical form. The problems of mechanics are splendidly embodied in the design of the various parts, and in many diverse ways, modified as is the application by the strains to which the parts are submitted, the strength of the materials and the practical methods of their working. Every conceivable strain, simple and compound, since it enters the working of the steam engine, for instance, comes up for consideration, while all the leading materials enter its construction. The prime movers act as fine checks on the student's individual efforts at design, for they represent the embodiment of centuries of application and development by the best engineering talent. They give opportunity for experimental verification of the laws of physics and mechanics as well.

I fully appreciate the view that it is commendable, indeed desirable, that the students, when graduating from technical schools, should possess some general knowledge of the leading machines in the market, but the first essential thing is that they should have acquired the ability to be useful workers in every field, by being possessed of a knowledge of the principles and methods of procedure which underlies all engineering works and machines and their design.

It has occurred to me that some of the theoretical preparatory studies pursued, such as mathematics, physics, chemistry and the like—and I purposely omit languages, belles-lettres, and those general academic branches having a less intimate connection with the engineering course—seem not to be carried out in some particulars so as to secure the highest efficiency from an engineering point of view.

Let me call your attention to this point: Is it not remarkable that essentially the same text-books on physics, chemistry, analytical mathematics, descriptive geometry and the like are studied at engineering schools as at the ordinary academic course of a university? Does not this fact of itself almost imply that the studies, as pursued, are not made to specially adapt themselves to the needs of the applied studies of the engineer? Could not some abstract developments, now dwelt upon at length, be advantageously omitted, while physical experiments and applications in heat, electricity and the like be more copiously introduced as exercises, both with the view of imparting a thorough hold on the abstract taught, and also as imparting requisite useful information and methods of procedure? It is my opinion that, in the application of mathematics to physical problems, even the mathematician, and certainly the engineer, can best test and master a knowledge of the mathematics themselves. How common is the experi-

ence of those who, having acquired in the usual way, even from the best of masters, what they considered a pretty fair hold on calculus—and this embraces the experience of many gifted students—when they tried to apply this knowledge in the study of the mechanical theory of heat, they found they really had no thorough grip on the calculus as they had presumed, and had, in fact, to start anew, with a decided loss of time, which might, it seems to me, have been avoided.

I concede the value as fully, and am as anxious as any one to guard the pursuit of knowledge in the abstract on its own account. Still, I say, why not in plane, solid, descriptive and analytical geometry, and in calculus and other analytical mathematics, gain some time now devoted to the elucidation of abstract propositions and detailed elaborations in various forms of the same propositions, of no direct value, and some time now devoted to applications, which, designed to test the understanding, are really essentially numerical substitutions, so as to find leisure to supply physical problems as a test. The latter problems best serve to call forth a true knowledge of the principles. It is only in such application that we discover whether we have really grasped and actually secured the full meaning of the principle. So, too, in the course of physics, as pursued in mechanical-engineering schools, some details now studied, from force of habit and as being the regular thing in a complete course of physics, might, it appears to me, be advantageously omitted and replaced by special and more extended work in heat, electricity, elasticity and the like.

Anti-Corrosive Propeller Blades.

According to recent English accounts Mr. John Willis, of the firm of John Willis & Co., Specialty Steel Works, at Attercliffe, claims to have discovered a new method of preserving iron and steel propellers, blades, &c., from corrosion. Seagoing engineers and shipowners know that corrosion sets in very quickly upon the back of propeller blades, and to a greater extent in steel than in cast iron. The first cost of manganese bronze or gun-metal blades weighs seriously with shipowners; and it is, therefore, of the highest importance to look to the improvement of iron and steel blades. Mr. Willis's invention consists in a coating of copper united to the casting. This is effected by the copper plate, properly bent to shape, being placed in and forming part of the mold into which the iron or steel is poured, with the result that the copper is firmly united by fusion to the iron or steel face. All anti-corrosive metals are covered by the patent. Several of these are now undergoing tests to ascertain the most suitable for this purpose. Specimens of steel and copper united in this manner have been exhibited. There appears to be a perfect joint, the steel and copper being fused together and thoroughly united. It may be added that the blades can be totally coated if considered desirable.

The Hibernia Works, of Sheffield, announce, under date of July 2, that Albert Marples has retired from the business, and that it has been arranged that Harry Edgar Marples and Edward Albert Marples, sons of the senior partner, shall be taken into the firm, which will be conducted under the firm of William Marples & Sons, as heretofore.

If carried into execution, the contemplated improvements of the Point Breeze, N. J., company, will secure for business purposes extensive piers and basins to be excavated from the mud flats on the New Jersey shore.

* From Presidential Address delivered before the Alumni Association of Stevens Institute of Technology, June 18, 1888, by A. R. Wolff

Joints of Pipes and Fittings.

It is a noticeable fact that with the general and increasing use of pipes the question of joints has been little discussed, and the methods of making joints have remained almost unchanged. The cast-iron hub and spigot joint, Fig. 1, caulked with iron borings, is probably the oldest kind of joint. This is still generally adopted in hot-water heating of

and the use of a gasket of rubber, copper, paper or cement, with bolts for drawing the faces together. These joints for cast-iron pipes have not been changed excepting for some classes of work where a lip and recess, Fig. 3, is formed on opposite flanges, which make the internal surfaces smooth and aid in preventing the gaskets from being blown out.

In wrought-iron pipe work the general practice in making joints between pipes

pipe, and the internal projection of the thickness of the pipe and that of the thread of the fitting increases materially the friction due to the interior surfaces of pipe and fitting. This class of joint requires care in the tapping of the fittings and in the cutting of tapered threads on the pipes, and much trouble is caused by an inaccurately cut thread, as it may throw a line of pipes several inches out of place and put fittings and joints under undue and

Fig. 8.

JOINTS OF PIPES AND FITTINGS.

a certain class, and was formerly used with low-pressure steam. A fairly regular smooth internal surface is obtained, and once made tight, is very durable. Cast-iron flanged pipes have also been a long time in use. These joints were first made with a wrought-iron ring gasket, wrapped closely with yarn, A, Fig. 2, which was sometimes dipped in a mixture of red and white lead. It was then placed between the flanges, it being of such a diameter as to fit within the bolts by which the joint was screwed up and a nest or iron joint, B B, caulked outside the annular gasket between the faces of the flanges. The next step in cast-iron flange pipe-joints was the facing or turning up of the flanges

is a wrought-iron coupling, Fig. 4, with tapered threads at both ends. These couplings are liable to extend or expand under the internal pressure of the tapered end of pipe while being screwed in, to prevent which heavy cast-iron couplings or flanges are used in certain classes of work. The pipes do not meet at their ends, and a recess of about $\frac{1}{4}$ -inch or more long by the depth of the thickness of the pipes is left at every pipe end. A similar tapered thread is used in connecting the cast-iron fittings, elbows, tees, &c., Fig. 5, to the pipe, and a large recess is necessary in each fitting to allow for the tapping of the threads. Thus the inside diameter of the fitting is larger by $\frac{1}{8}$ inch than the outside diameter of the

irregular strains. The right and left threaded nipple, Fig. 5, is used as a finishing connection joint and between fittings. To make up this joint time and care are necessary, and even then its tightness is problematical until tested. The right threaded end on nipple should be first firmly screwed with the tongs or wrench into the right threaded end of fitting, then slacked out and screwed up again by hand until tight, when it is screwed back by hand, at the same time counting the number of threads it has entered by hand. The same is done with the left threaded end of nipple and fitting. If the right and left threads of nipple have counted the same number of threads, each

thread, when making the joint up, should enter the fittings at the same time if possible, and particular care must be taken that the fittings are exactly opposite, to facilitate catching on, prevent crossing threads, and that no irregular strain comes on the nipple while being screwed up. If these joints leak when tested and if screwed in further when warm, or after being treated when cold, the joints of both threads are not always certain to tighten up equally and at the same time. The right and left coupling, Fig. 6, involves the same amount of work and care.

The long screw-nipple, with coupling and faced lock-nuts, is another method of joining pipes and fittings. It consists of a nipple with a long parallel thread on one end, of sufficient length to receive coupling and nut, the other end having a short tapered thread, which is screwed into the

time is occupied in counting, fitting and screwing them into position. When top and bottom connections are made between sections of radiators, each right and left nipple has to be screwed in alternately half a turn at a time to prevent binding or crossing threads, and to remove a section from between others the radiator has to be moved apart a distance equal to at least the length of the nipple. To avoid the use of these right and left nipples in connecting sections of radiators a long bolt through or near one set of joints is used, while close nipples are used in the other joints. It is not, however, generally considered good practice to risk from five to thirty joints on one bolt, especially when the compression which the sections undergo from expansion is taken into account. However, this bolted point has in some instances given good results, but not in all.

these flanges is first ascertained, and the exact length that the pipe has to be cut is approximated in order to allow for the screwing up of the threads of the pipe and flanges. In screwing up the flanges, the holes for the bolts have to be located so as to meet those in the existing flanges. The pipe with flanges is then lifted into place, and the gaskets dropped between the flanges, the bolts are inserted and screwed up. The gasket joint between flanges may be tight, and the threaded joints of pipe to flanges may leak, and if the leak is serious there is only one remedy, which is to break the bolted joint and screw up the flange another turn. To summarize the peculiarities of the present method of joining wrought-iron pipes and fittings, it is only necessary to call attention to a few facts. With the union as well as the flange union, three joints have to be made tight, to obtain one required joint. In the wrought and cast-iron coupling, be it with right, or with right and left threads, two joints have to be secured to obtain one connection; and in the pipe and fitting, no single joint can be tightened up while in position without the loosening of another joint. No pipe between ordinary fittings can be removed without breaking the fitting or cutting the pipe. Thus it is that so much time is wasted in fitting up a pipe system, and an improvement in the construction of joints will aid materially in a still more general adoption of steam and hot-water heating.

New Pedestal Tenoner.

Messrs. C. B. Rogers & Co., of Norwich, Conn., and with warerooms at 109 Liberty street, New York, are bringing out a new pedestal tenoner shown in the accompanying engraving. In the design and construction of this machine they have embodied all of the best features of the style of tenoner formerly produced by them, and in addition have introduced new and thoroughly practical ideas. As will be seen in the cut, all of the working parts of the machine are supported on a heavy iron frame, cast in pedestal form, and to which at either side are attached the boxes for the main countershaft. Attached to this column, and cast with it, is an arm with V track that supports one end of the carriage or table, the other end being supported by a smooth-way attached to an extension of the foot or base of the machine. With this arrangement of the way the operator is enabled to follow the carriage right up until the work has passed the cope cutters. The cutters' heads, with straight cutters set for a draw cut, are attached to heavy steel spindles, running in self-oiling connected boxes, to which are also hung the cope-heads, the whole being gibbed to the upright. By an ingenious arrangement the heads are raised and lowered independent of each other, or may be adjusted together to any desired height above the carriage without altering their relative positions. The copes being hung on the same yoke with the tenoning heads, when once set, require no further attention; they are, however, provided with both horizontal and lateral independent adjustment. The pulleys on the cutter-head spindles, as well as the main driving pulley on the counter, are placed between the bearings, and all the other pulleys placed close to the bearings, adding much to the stability and capacity of the machine. The arrangement of this machine is such that every necessary adjustment may be made from the operator's position in front of the carriage.

The frequency of lead poisoning in Newark, N. J., excites much inquiry respecting the cause. One physician suggests that it may be the use of patent stoppers, such as are used in bottles.

PEDESTAL TENONER, BUILT BY C. B. ROGERS & CO., NORWICH, CONN.

fitting. The long screw end of nipple is brought close to end of pipe to which it is to be connected; the coupling is then screwed tightly up on tapered thread on pipe, leaving about half the coupling on long screw of nipple, and the lock-nut is screwed up against coupling, packing being inserted sometimes between the faces of it and the lock-nut. Close nipples are used for another joint. It is a short nipple with all its external surfaces threaded, it having tapered right threads from the center to the outer ends. These nipples are liable to be cut inaccurately on account of the difficulty of holding them. They are used where fittings come close together and in connecting the links or sections of direct radiators having no bases.

There are, besides, right and left threaded nipples of malleable or cast iron, with hexagonal or round centers between the threads, by which the nipples can be turned, and also close right and left threaded nipples with interior flats or projections for an internal wrench. These are used for connecting sections of indirect and direct radiators. Much accuracy is required in their manufacture and the tapping of the holes for them, and much

Another joint in wrought-iron piping is known as the "union," Fig. 7. A union is composed of three pieces and the washer, and when placed complete in position six threads have been cut and tapped, and care must be taken to have the faces of the union square, exactly opposite one another, and close together. Unions are also made with ground joints, and the washer dispensed with. Radiator valves are now generally connected by them, but if the hole in the radiator is not tapped accurately the union when drawn up will not be tight, or if tight the valve will not be straight.

The flange union, Fig. 8, is another joint generally used on wrought-iron pipes above 4 or 5 inches in diameter in making connections to valves, &c., and on smaller pipes in positions where it is a convenient joint. This joint consists of two circular cast-iron flanges with the requisite number of holes for bolts, and central hole tapped tapered to receive thread of pipe. The abutting faces of the flanges are generally turned and the holding bolts fitted into the holes. To fit up a piece of wrought-iron pipe between two flanges already in position, the distance between

Underground Electric-Light Wires in Europe.

A Milan (Italy) correspondent of *Industria* contributes the following interesting particulars to the subject of underground wires for electric lighting in that city:

Milan was one of the first cities in Europe in which the distribution on a commercial basis of electric light from a central station has been in continuous operation for nearly five years, and has steadily increased its capacity year by year, maintaining its claim to be the largest electric light station on the Continent. It has passed through various phases of development, supplying at first only incandescent lamps in multiple arc, and then successively adding arc lamps supplied from the incandescent lamp circuits, an independent arc system, and finally the alternate current system. These systems require different types of conductors, with varying degrees of insulation adapted to the different currents and pressures. At first, while the station supplied only incandescent lamps on the Edison two-wire system, the requirements as regards insulation were moderate; but with the application of new systems, operated with pressures of 1500 to 2000 volts, and both direct and alternate currents, new conditions presented themselves, and more particularly in the circuits that were laid underground.

The Milan installation, as at first projected, supplied only Edison lamps from a general underground network, as usually adopted in Edison stations, and in which a constant pressure is maintained by feeders. Edison tubes were at first exclusively used, but on the introduction of the arc lighting system a new type of conductor had to be adopted. The conductors for the supply of the Edison incandescent lamps are all underground, and comprise at present over 13 km. (8.1 miles) of Edison tubes (two-wire system) and 1 km. (0.6 miles) of Siemens cable. For the series arc lighting the Thomson-Houston system is used, only part of the circuits being underground. For this purpose single conductor, lead covered and armored Siemens cables are used, and of this type about 6½ km. (4 miles) have been laid. A Siemens double-conductor concentric cable, having a length of 1.8 km. (1.1 miles), supplies a number of incandescent lamps at some distance from the station, on the Zipernowsky-Deri system. We have thus installed in Milan at present a total length of underground conductors amounting to 22.3 km. (14.2 miles). These several lighting systems are representative of the various conditions of supply which a well-equipped station is called upon to meet, and a few details of the various conductors used, and their electrical properties, may be of interest.

The construction of the Edison tubes is too well known to merit a detailed description. Suffice it to say that in Milan the two-wire system tubes are used with the lamps in simple parallel. In the underground conductor network the tubes are of two classes—mains and feeders. The former have a constant sectional area of 92 sq. mm. (0.14 square inches), and represent a total length of 8 km. (5 miles). The feeders have sectional areas varying from 250 sq. mm. (0.386 square inches), and lengths varying from 118 m. (387 feet) to 690 m. (2260 feet), representing a total length of 5 km. (3.1 miles) in tube lengths of 6.2 m. (19 feet) each. In the case of feeders, the large number of joints which the use of such short conductor lengths entails is not advantageous and not necessary, as feeders have no derived circuits, and run from the station straight out to the point at which they are attached to the distributing mains. These conductors

carry currents as high as 400 and 500 amperes, with a pressure of 110 volts, and require to be fairly well insulated, as a short circuit of heavy earth in conductors of such a large sectional area might compromise the regularity of the station service. The insulation resistance between the copper segments is usually higher than the insulation to earth, which in the different feeders, after having been in use for five years, varies from a minimum of ½ megohm up to 150 megohms. Cables are to be preferred for feeders, as they may be laid without intermediate joints, or with a relatively small number of such joints, rendering it less difficult to obtain and maintain a higher insulation resistance than in the case where tubes are used as feeders. For one of the feeders a Siemens single conductor lead covered and armored cable is used for each pole of the circuit. The cable has a sectional area of 625 sq. mm. (0.96 square inches), formed of 35 strands of wire, each wire having a diameter of 4.77 mm. (No. 7 B. W. G.). The resistance per kilometer is about 0.0253 ohm.

The cable is provided with a testing wire, which permits of the application in the station of a voltmeter showing the pressure at the feeder terminals, where they are attached to the distributing mains. The stranded core has an insulation of specially prepared hemp, over which follows a lead covering, which is in turn served with a layer of tarred hemp, and the armor consists of two spiral iron bands wound in opposite directions, and served on the outside with a layer of tarred hemp. The external diameter of the cable is about 2.2 inches. The cable has a total length of about 1000 m. made up of lengths of 100 m. each, joined by heavy copper clamps in suitable junction boxes, which are filled with a special insulating compound. The insulation to earth of each pole of the cable has not varied sensibly since it was first laid down some six months ago. This cable has been daily carrying a current of 350 amperes at 110 volts, and the insulation remained constant at about 750 megohms per kilometer of conductor. The cable was delivered in coils of 100 m., which were mounted on a drum supported by an axle spanning the ditch into which the cable was to be laid, high wheels on the sides serving to move along the drum while the cable was being unwound.

The conductors (tubes or cables) are laid in ditches at a depth of 25 to 30 inches below the street level, and the cables are unrolled from the drum right into the ditch. The conductor (tube or cable) having been covered with a layer of earth to 3 or 4 inches, a rough charred and tarred plank is laid over them, to give warning to any future diggers of the proximity of the conductors, and the ditch is then filled up and the paving made good. This simple expedient of laying a board over the cables has saved them from many a pick hole. The Edison tubes were given an extra coat of tar paint before laying in the trenches; but in Milan, which is sadly in need of a complete sewage system, the leakage from the roughly constructed sewage conduits has in many places attacked the iron of the tubes. The streets are built up over the *débris* of the habitations of past generations, and the soil in such localities would in time have ruined the tubes. To effectually preserve the 2000 tubes laid in Milan from becoming corroded to an extent that might in course of time endanger their insulation, it was decided to protect them with a layer of asphalt. The tubes as they lay in the ditch were scraped free from the attached earth, and a tarred wooden box slipped around them, leaving a space of 4 inches between the tubes and the sides of the box. Into this space was poured an asphalt in a semi-liquid state, and consist-

ing of 2 parts of fine sand to 1 part of tar, forming a durable and perfect protection. Some tinned wrought-iron gas pipes that were laid in Milan 35 years ago, and protected with a layer of similar composition, were dug up a short time ago and the tinned iron surface underneath the asphalt was found as bright as when first laid down.

Turning now to the conductors for the Thomson-Houston arc-light system, in which the use of a high pressure requires a more perfect insulation than in the case of the 110-volts circuits, the four dynamos installed in the Milan station have each a capacity of 30 arc lamps connected in series and generate a normal current of 10 amperes. Each dynamo has an independent circuit and two of the dynamos have only their outgoing wires under ground, the return being through an aerial line, while the other two dynamos have both of their circuits under ground, and in this case the under-ground conductors are, therefore, subjected to the full pressure of the dynamos. The under-ground conductors are all lead-covered and armored cables, with a single No. 8 B.W.B. wire. Two types of conductors have been used, one in which the armoring consists of spirally wound iron wires, and a later type in which (as in the case of the previously described larger cable) the armoring consists of two spiral iron bands wound in opposite directions, the outside diameter of the cable being about 1 inch. Although these cables have been in continual use for two years subject to a pressure of 1500 volts, no decrease of their insulation resistance has been observed and no difficulties of any kind have ever been encountered in their use. They were furnished in lengths of 300 m. and had an insulation resistance of about 1200–1500 megohms per kilometer, which, after laying down with joints and connections, became reduced to about 600 megohms per kilometer. At this point it has remained. In especially exposed places the cables are laid into tarred wooden troughs and the space around the cable filled in with cement.

The introduction of the alternate current transformer system called up new requirements, and to meet them we have the double conductor concentric cable. The Zipernowsky-Deri system is used in Milan for the lighting of two theaters that are too far from the station to be economically reached by the network of the Edison system. These theaters are situated respectively at 1200 and 1800 m. from the central station. The concentric cable conveys the 200-volt primary current from the station to the theater, where it is transformed into a 110-volt current supplying Edison incandescent lamps. In general construction and protective armor the concentric cable is similar to those already described, with the exception that it has two conductors placed concentrically. The internal conductor is a single wire of 6 mm. (No. 4 B.W.G.) diameter, and the outer conductor is composed of 44 strands of wire of 0.88 mm. diameter. (No. 20 B.W.G.), with a heavy hemp insulation separating the two circuits. At a point 1000 m. from the station, the cable divides into two branches, one of 260 m. and the other of 600 m., making a total length of 1800 m.

Chamberlain, Wheeler & Co., of Columbus, Ohio, have been appointed sole sale agents for the Sheffield and Birmingham Coal, Iron and Railway Company's plant at Sheffield, Ala., which has just been completed. Within a few weeks the three furnaces will be in blast. The estimated aggregate capacity will be 420 gross tons daily. The company will use brown hematite ores exclusively, a fact which gives promise of a high quality of product.

The Sheet-Iron Manufacturers' Meeting.

A special meeting of the Sheet Iron and Sheet Steel Manufacturers' Association was held in Pittsburgh on Wednesday, the 11th inst. N. E. Whittaker, of Wheeling, W. Va., was chairman, and W. C. Crone-myer, of Pittsburgh, acted as secretary. About 15 firms were represented. The object of the meeting was to discuss the proposed reduction in the tariff on sheet iron and sheet steel. It was decided to send Mr. John Jarrett to Washington to protest against the bill at the meeting of the Senate Committee on Finance, which took up the bill on Thursday, the 12th inst. A member of the association made the following statement after the close of the meeting as to the action taken and the present condition of the trade: "The low price of sheet iron at present is directly due to the low tariff on the English product. The Mills bill will reduce it even lower, until we are driven out of the business altogether. For the past year or two people in the East could import English sheet steel and get it cheaper than they could from Pittsburgh. The present tariff schedule does not cover sheets of soft steel, and the consumers, taking advantage of the present laws, import soft sheet iron, on which they pay but an ad valorem duty. This places the Pittsburgh manufacturer at a disadvantage in favor of the Englishman.

"It was at first proposed to reduce wages to make up the deficiency until the tariff laws could be amended, but as we see the men will not accept a reduction we must do something to save ourselves. A number of manufacturers, instead of making their own sheets, find it more profitable to import those of English make. The difference between the wages paid in this country and England for the same work is from \$6 to \$8 per ton."

Joseph Wharton on Nickel.

The following letter from Mr. Joseph Wharton, the only producer of nickel in the United States, is published in *Lock and Bell*, of New York:

You call my attention to Mr. E. P. Wheeler's remarks concerning my nickel business, and to the Meriden Britannia Company's reply, as published in your paper, and you ask for my comments. I know nothing about this Mr. Wheeler or his affairs. He is obviously no less ignorant about me and my affairs. Mr. Wheeler assumes that I have grown rich by reason of a bounty paid to me in the guise of an import duty on foreign nickel, virtually a tax, as free traders delight to call such an import duty, drawn from my helpless fellow-citizens by the Government for my benefit. He grieves that the Meriden Company were so oppressed by this tax as to be forced to build a factory in Canada, and he thinks that "if Congress had passed a law making him (me) Duke of Lancaster, and giving him (me) a pension of \$20,000 a year," it would have done, except in name, just what it has done. Mr. Wheeler's untruth about the Meriden Company having been demolished by that company I turn to his other points. Is it then true that I am an incubus on my countrymen, idly sucking their subsistence by means of a vicious tax for my pampered sustenance? No! It is not true. It is a lie. In the year 1862, after having established in this country the manufacture of spelter or metallic zinc, I was informed that the United States Mint was unable to procure nickel for making one-cent coins, since the American attempts to produce that metal had broken down, and in no foreign country could an adequate supply be purchased. Inquiry

at the Mint confirmed this: the coinage of cents was really suspended for that cause.

I purchased the remains of the disused nickel works in Camden, N. J., and the Gap nickel mine in Lancaster County, Pa., which was then idle and full of water. These I put in order and wrestled for seven years with the inherent and the artificial difficulties of the business, at the end of that time having what was probably the completest nickel establishment in the world, though it has as yet yielded but little profit. In that interval my factory in Camden had been burned down and rebuilt, with great improvements; the Government had abandoned coining nickel alloy cents, but had afterward adopted, first a 3-cent coin and later a 5-cent coin of a richer nickel alloy; the foreigners who, before I started, could not satisfy either our mint or our private bureaus, had been my fierce competitors for the custom of both; the price of nickel had averaged about 4s. 6d. per pound in England, and about \$1.25 per pound here; the import duty, which was 10 per cent. in 1863, had increased in 1866 to 15 per cent., the latter being about one-third the average rate of duty on all other dutiable imported goods. The pampering of the wicked nickel-maker had not yet begun. In 1870 the duty on nickel was raised to 30 cents per pound, in 1872 it was reduced to 27 cents and in 1874 it was restored to 30 cents—about one-half the rate of duty on other metals. The business now yielded a moderate profit, the customers were well satisfied and my wickedness was not yet apparent, except to some disappointed foreigners.

In 1873 the German Government decided to adopt nickel alloy for certain of its coins, and thereby created a demand for nickel which absolutely stopped all shipments to this country from Europe and carried large quantities of my nickel to Europe. The price there ran up to the unprecedented figure of 16 shillings per pound for a time, equal to nearly \$4 per pound, and for several years averaged about 12 shillings or \$3 per pound. American nickel buyers had absolutely no resource but my works, but I kept them fully supplied at prices as low as those of Europe, not including import duty, and was kindly informed by one of my old English competitors that I sold needlessly low. My profits during those years were, of course, large, but it is hard to see how Mr. Wheeler could have prevented them. Then came a great decline, caused by the cessation of German coinage and by large shipments of rich nickel ores from the lately opened mines of New Caledonia. Year after year the price fell, and one after another the nickel mines and works of Europe succumbed to the constant pressure of the lower and lower prices established by the great nickel monopolist of the world, the French company, Le Nickel, which owns the great mines of New Caledonia. The price in Europe is now about 2 shillings a pound, and here about 60 cents a pound. No nickel mine and only two or three nickel works in Europe have survived the attacks of Le Nickel. In this country I am alone and Mr. Wheeler will kill me if he can have his way.

A marked feature of the early years of this incessant fall was the urgency with which the foreigners shoved their nickel into this country, and the amiable willingness of Secretary Folger to connive at their cheating the customs. The duty on nickel being 30 cents per pound, and that on alloy of nickel with copper (meaning a half-and-half alloy which had been in vogue) being 20 cents per pound, foreign nickel makers experimented on the complaisance of our Government by increasing the proportion of nickel in such alloy until they

had raised it to 95 per cent. (as high as commercially pure nickel when the law was made), and all this was for years admitted by Mr. Folger at the low rate of 20 cents per pound. Surely Mr. Wheeler should find some consolation in this happy device of his friends. Next, after some years of depression, came the Tariff Commission of 1882. Congress then, not following the recommendation of that commission, but acting upon it with an intelligence akin to that of Mr. Wheeler, set upon pure refined nickel the duty of 15 cents per pound, and upon a pound of nickel in matte or in ore the same duty of 15 cents per pound, and so the law now stands.

This charming arrangement, which shuts out all nickel material, while admitting refined nickel, the most difficult of metals to produce, at an inadequate rate equaling about 30 per cent. ad valorem, is mad enough, one would think, to satisfy any free trader who is not unusually dyspeptic. Yet it is against this that Mr. Wheeler pipes his little complaint. Under it more than two-thirds of the nickel used here is imported, and my works pay no profit, not even any interest or rent on capital or plant. The effect of my persistence in running the works which Mr. Wheeler would like to close is that foreigners sell their nickel here at less than their home price plus our duty, hoping to break down my works and then recoup by higher prices. Here is no wicked pampering of a lazy monopolist, and I submit that the free trader who demands yet more for his foreign friends is almost too good a Mugwump to live in this sad world. I have refused to notice the variegated nonsense that has from time to time appeared in print about my nickel business, but it is perhaps my duty to put a stop to it. It is men of my kind, and not of Mr. Wheeler's kind, who make this country something for its citizens to be proud of, and for the people of other countries to respect.

New Guns.—Some recent firings at Sandy Hook with the army 12-inch breech-loading steel mortar for long range tests have given highly satisfactory results. With a charge of 80 pounds of powder and a 630 pounds shell a range of 6 miles and 135 yards was obtained. The two 8-inch breech-loading steel guns built by the West Point Foundry for the Chicago have been completed and shipped to the proving grounds at Annapolis for test. The 10-inch steel breech-loading rifled gun designed for the iron-clad Miantonomoh, and the first steel gun of this caliber completed by the navy, has been finally adjusted upon its hydraulic carriage at the Annapolis Proving Grounds, and fired to test the working of the carriage and breech mechanism. These worked easily and accurately, and the gun is now in a condition to carry on experiments for determining the proper grade of powder with which to conduct the statutory tests.

In 1878 the six great French railway companies were working between them 11,700 miles of line. At the close of 1887 the corresponding total had risen to 18,045 miles. This latter total was made up as follows: Paris, Lyons and Mediterranean, 4970 miles; Orleans, 3703 miles; Western of France, 2805 miles; Eastern of France, 2718 miles; Northern of France, 2157 miles, and Southern of France 1692 miles.

The Lowell Machine Company, of Lowell, Mass., were incorporated in 1845, and their capital stock is \$900,000. They employ 1400 men; their weekly pay-roll amounts to \$11,000; the territory covered by their shops and boarding houses embraces nearly 13 acres, and they have the capacity to turn out the machinery for a mill of 40,000 spindles in three months.

A Trip to Lebanon, Pa.

Last Thursday a small party, gathered at Philadelphia in a special car to visit two manufacturing establishments in the Lebanon Valley, with the chief object of affording Messrs. Watson and Mueller, engineers of Mr. Claus Spreckles, the sugar king of the Pacific Coast, an opportunity to satisfy themselves that one of the concerns possesses the facilities to carry out contracts since entered into for supplying the ironwork for the great sugar refinery now being built in Philadelphia. Besides the gentlemen named the party consisted of Frank Dundore and James Meily, of F. Dundore & Co., Philadelphia; L. M. Moyes, of the Babcock & Wilcox Company; Adam B. Rork, who has the contract for part of the work of building the refinery, and Charles Deacon, a well-known Philadelphia journalist, the representative of *The Iron Age* being the eighth member of the party. Early on Friday Conewago Junction, on the Pennsylvania Railroad, was reached, the special car being taken to Lebanon over the Cornwall and Lebanon Railroad, one of the most thoroughly built and equipped lines in the country. Comfortably sheltered in the Lebanon station of the road, a little gem architecturally, the party partook of a substantial morning meal after having made a preliminary reconnaissance of the works of

THE LEBANON MFG. COMPANY,

a concern which has developed from modest beginnings nearly a generation ago to a well-equipped plant, employing between 300 and 400 men, having a capital now of about \$237,000. For years the company have made a specialty of steam engines, blowing engines, furnace ironwork, general machinery, and of late years have added the building of cars to their lines. Among the contracts lately filled were six blowing engines for furnaces at Sheffield, Ala., built by Gordon, Strobel & Laureau, the last of the six having been shipped about two weeks since. The foundry, a brick building of 60 x 195 feet, contains one 54-inch Colliat cupola, and one 40-inch ordinary cupola, two spacious core ovens, the whole floor space being commanded by a 20-ton Niles overhead traveling crane of the latest design. The machine-shop, 60 x 198 feet, besides a large variety of smaller tools, contains a 6 x 7, 28-foot Putnam planer, a Niles boring mill, 14-foot swing and 10 feet high, a 96-inch Niles locomotive wheel lathe, and a 58-inch Niles radial drill. The smith shop is 50 x 125 feet, and there are, besides, car works with the necessary wood-working machinery, a setting up shop, paint shop, storehouses, &c. The officers of the company are A. Reinohl, president; R. Meily, vice-president; J. M. Gettel, superintendent, and J. Hunsicker, treasurer, the agents being Frank Dundore & Co., of Philadelphia. It is in this establishment that the cast-iron work for the Spreckles' refinery is to be made, the contract for the first block of 2300 tons, including beams, &c., having been awarded to Dundore & Co. It is estimated that the entire structure, will call for 13,000 to 14,000 tons of cast and wrought iron, the capacity of the refinery aimed at being 1000 tons of sugar per day.

Taking the car over the tracks of the Lebanon and Tremont Railroad, the party was carried past the old town of Jonestown, once a busy place on the long-abandoned Union Canal, to Lickdale, where the works of

THE LICKDALE IRON COMPANY

were inspected. On the site of an old forge, parts of which are still standing, this company have built a Clapp-Griffiths plant, after the well-known design of Mr.

James P. Witherow, of Pittsburgh. It consists of two 3-ton converters, one of which was blowing at the time of the visit, the most interesting feature in connection with the operation being the copious flow of cinder from the cinder notch during the blow, and the fact that mountain limestone is used to make the bottom. The mixture used, in connection with which there are some interesting points, appears to make a hot blow, and allow of considerable additions of scrap. The works have a Lewis two-high blooming train, driven by a Tod Porter-Hamilton engine, and served by a Smith gas heating furnace. The location, however, does not appear to be favorable, situated as it is on an unimportant branch road. Last year the company made a round lot of higher carbon steel for rail blooms, but the conviction has been reached that the proper sphere for the plant lies in mild steel, and attention is now being given particularly to slabs and billets for rails, plates, sheets and structural shapes. Col. J. N. Lick, a relative of the famous James Lick of Pacific-Coast fame, is president and C. P. Sherk is superintendent, Frank Dundore & Co. being selling agents.

Returning to Lebanon a visit was paid by a few of the party to the Weimer Machine Works, too hasty, however, to do justice to the magnitude of its operations or the many interesting special points noted. In the erecting shop was a very large blowing engine, just being completed for the Warwick Iron Company, and a smaller blowing engine, one of a dozen, built or building, for the Ensley plant of the Tennessee Coal, Iron and Railroad Company.

Returning to the special car, the latter was found to be decorated with flags and devices expressive of the sentiment "Protection to American Industries," which met with expressions of approval from the men employed at the mills and furnaces passed during the rest of the journey. After a very brief visit to the Colebrook furnaces, probably the most lavishly equipped plant in the United States, the party was carried to the famous Cornwall ore banks. Drawn up over the great spiral track to near the summit of the big hill the party ascended to the top to find spread below the fertile Lebanon Valley, with 11 furnaces, all in active operation, within sight, all of them drawing their supplies from the wonderful deposit lying at their feet. During the last six months these furnaces clustered around Lebanon made 119,000 gross tons of pig iron.

Magnificent though the mineral properties of this country may be, none thus far discovered outside of the exhausted Comstock lode approaches in past record or in present or prospective value that of the Cornwall ore banks. The Calumet and Hecla, with its great record of dividends, the Ontario, of Utah, the best paying silver mine in the Rocky Mountains, the Homestake, the great gold mine of the Black Hills, Dakota, the Vermillion mines, of Minnesota, the Colby, of the Gogebic range, and the famous properties of the Marquette and Menominee regions, the enormous magnetite deposits of Lake Champlain, and the far-famed Iron Mountain, of Missouri, are all eclipsed by this Pennsylvania accumulation of iron ore. It has been repeatedly described in detail, the most elaborate, scientific and historical monograph on it having been published a few years since by D'Inwilliers, of the Second Geographical Survey of Pennsylvania. Yet few outside of a comparatively narrow circle realize how enormous must be the revenue drawn from it, and what are the vast possibilities for the future.

The cost of putting the ore on cars is 20 cents a ton. As it carries considerable sulphur it must be roasted, which is usually estimated to cost 40 cents

a ton, the kilns being at the furnaces. Adding as a liberal figure 15 cents a ton for transportation to the furnaces in the immediate vicinity of Lebanon, a total cost is reached of 75 cents a ton, roasted, at the furnace. The ore, however, is sold to the furnaces, the majority of which are controlled by parties holding an interest in the ore banks, on a sliding scale based on the monthly average price realized for No. 3 pig iron. In the case of the latter, an important part of it is again based on the price of rails at the consumer's mill. Taking the ore at cost and coke at \$3.50 per gross ton, the cost of production of pig iron must be under \$10 a ton, while the selling price even now averages probably slightly above \$14. Of course the furnace companies as such do not earn such profits, but it is probably within the bounds of the truth when we state that the owners of the ore banks realize fully \$2 a ton, if not more, on every ton quarried. In 1887 the output was 667,210 gross tons, and in 1886 it reached 688,054 gross tons. When it is considered that generations will not exhaust the deposit at the present rate of extraction, some idea may be obtained of the royal income derived from the property by its possessors.

The concern is divided into 96 shares, of which Robert Coleman owns over 30, the balance being cut up into comparatively small holdings. Conversing on one of the latter a gentleman who is very familiar with the property was asked what he believed two shares would fetch if thrown on the market. After some hesitation, and prefacing it with the remark that it depended largely upon the condition of the trade and other circumstances, he expressed the opinion that it would probably not be a difficult matter to get \$500,000 for one forty-eighth interest in the property. The possession of a claim upon the profits realized certainly seems to create some indifference to values if there is any foundation in an anecdote related. One of the fortunate owners of a few shares in the Cornwall mills has a residence in one of the leading cities of the United States. Adjoining it there is a large hotel, whose proprietor, encouraged by success, believed that it would be a good investment to purchase the adjoining property for the sake of enlarging his facilities for entertaining guests. A suggestion on his part that the owner of the residence name his price was met with the startling answer: "What will you sell your hotel for? I have long been thinking of enlarging my lawn."

The view into the charming valley of Lebanon was a fitting climax to the trip to one of the most favored sections of the country, the home voyage being promptly begun.

Among the retail hardware concerns at present doing business at Quincy, Ill., is that of the Cottrell Hardware Company, located at No. 124 North Fifth street. The company occupy the entire structure, which is five stories in height, and carry in stock a full assortment of general hardware, tin plate, agricultural implements, vapor stoves, woodenware, &c. The first floor of the building is devoted to the retail department, in the rear of which is the shipping department, which in turn adjoins the counting-room. One of the rules of this house is that all orders shall be shipped by the evening trains on the day they are received, something that is generally appreciated by the customers. The second floor of the building is occupied by the sample room. The third and fourth floors and the basement are devoted to the storage of goods. The company keep four salesmen on the road, who visit their friends in the trade once every month.

THE WEEK.

The New York and New Haven Railroad Company have completed arrangements for connection and a traffic agreement with the Poughkeepsie Bridge Company, and has signed a contract for 50 years. This will give the Delaware and Hudson, and the Erie direct connection for coal traffic with the New England States, and will also let the West Shore Railroad in for a short route direct to points east.

The Mexican Pacific Railroad about to be commenced will extend from Mazatlan to the Colorado River in Southwestern Arizona and will be one of the most important lines of railroad in Mexico, making a continuous line of 1400 miles. It is stated that when the concession was first secured it was the intention to obtain the aid of English capital in building the road, but when the promoters arrived in New York, they found an abundance of American capital at their disposal, and the road will be built and owned entirely by Americans.

Chief Engineer Church in his testimony before the Senate Investigating Committee last week to some extent approved of certain departures from the specifications which were made by the aqueduct contractors in the execution of their work. He said that practically the aqueduct is a tunnel all the way through, for the cuts were so deep that when filled in they were "practically tunnels," justified the use of the rubble masonry in place of dry filling. He had a sad example before him in the dilapidated old aqueduct. The question of dry filling or rubble masonry was not of much importance in a railroad tunnel, but of the greatest importance in an aqueduct, which was to last, not alone, for 20, 50 or 100 years, but for all time. In case of a break it would be impossible to carry on extensive repairs, and in a short time the city would be left without water. At any point a difference of 18 inches would upset the balance of pressure. The question had to be decided by the chief engineer alone, because he only had the data all along the line. When his assistants gave their views before the committee, no matter how well equipped they might be as engineers, they could not speak authoritatively on the matter in dispute because they had not all the data in their possession. Two years ago he himself had not that data.

English encroachments in Spanish America are the theme of a correspondent in Merida, Yucatan. The principal lines of railway are passing into her possession, and other schemes are in contemplation with a view to obtaining control, so it is alleged, of the entire transportation interests of that country. And now, says the writer, the Mexican Government has contracted with an English firm for the completion of that long-talked-of Tehuantepec Railroad, which when completed will furnish a shorter cut across the continent than either the Nicaraguan or Panama schemes. The road in question at various times has been a pet project with several parties in the United States, the last of whom, Edward Larned, of Pittsfield, Mass., made considerable progress in the work of construction. It now remains to be seen what the English corporations will accomplish. The line—whose entire length is about 200 miles, two-thirds of which is partially completed—runs from the bay to Coatzacoalcos, on the Gulf of Mexico, due south, to Salina Cruz, on the Pacific Ocean, traversing the southern portion of the States of Vera Cruz and Oaxaca. The Rio Coatzacoalcos is navigable for about 80 miles, and at low tide the depth of water on its bar is 18 feet. The immediate section produces cotton, sugar-cane, to-

bacco corn, coffee, cocoa, vanilla, sarsaparilla, ginger, indigo and india-rubber. Salina Cruz, the Pacific terminus, is said to have an exceptionally fine harbor. The English contractors (Col. Edward MacMardo, represented in London by Lord Archibald Gosford) are to receive \$10,000,000 in 5 per cent. bonds, secured by a first mortgage on the entire property.

The trestle bridge near Orange Court House, Va., broke down under the weight of a passenger train, and eight persons were instantly killed. Many others were wounded. The trestle was 48 feet high, and known to be weak.

Corean progress is uninterrupted, no political disturbances having occurred. The Legation at Washington city will soon be fully re-established and consulates be opened in New York and Philadelphia, American gentlemen filling the positions. The Corean telegraph and cable line has been completed to Japan by way of Fusan, and active steps are being taken looking toward the developing of the rich natural resources of the country. Advices are also received to the effect that Judge O. N. Denny, ex-United States Consul General to China, has been reappointed Governmental Adviser for a further period of two years.

An electric street railway, the first of its kind in Massachusetts, was opened for business last week, at Crescent Beach. The line is $1\frac{1}{4}$ miles in length, a branch of the Lynn and Boston railway. Like the electric road at Ansonia, Conn., the electric current is taken from a wire running above the track, the return current being conveyed through the rails of the track, which are connected by wire for that purpose.

Secretary Whitney and Secretary Endicott have each asked Congress for the appointment of an Assistant Secretary, on the ground that the efficiency of their respective departments will be greatly increased thereby. Construction to the extent of scores of millions of dollars is going on or is in contemplation for the purpose of replacing the old fleet by a new one. This work will probably last through the remainder of the century at least. Coupled with it is necessity for providing heavy guns for the new vessels. Respecting the war office in addition to the ordinary considerations, it must be remembered that it is now proposed to enter upon a most important system of coast and harbor defense, which may require the expenditure, first and last, of more than \$100,000,000 for forts, guns and auxiliary means of protection. This will necessarily impose new labors upon the War Department.

The new theater building on the site of Irving Hall will be absolutely fire-proof, with a domed roof richly ornamented with ironwork, and the interior will be fitted with an iron drop curtain.

The latest shipment of "canned goods" from this city to San Francisco comprises 16 tin cases containing the bones of dead Chinamen being returned for burial.

Work on the Croton Aqueduct thus far is said to have cost \$19,000,000, or more than double the estimates, and it is intimated that for this reason and the close relations between the commissioners and the contractors a reconstruction of the commission is probable.

There is a marked decrease in the number of buildings for which plans have been filed this year in New York City. The records at the Bureau of Inspection of Buildings show that the cost of the buildings in these plans for the quarter ending with March was \$9,480,491, and for the quarter ending with June was \$15,897,204, making a total for the six months of \$25,357,695. This is a remarkable decrease from

former years. The total for the first quarter in 1886 was \$17,088,643, and for the same period in 1887 it was \$17,254,865.

Chicago is promised a prosperous year in the building trades. The report of the local building department shows that up to July 1, 1888, the number of permits issued was 2156; value of buildings constructed, \$11,131,000, an increase of \$1,423,828 compared with 1887.

An important new departure in the use of natural gas is announced in Pittsburgh. The Philadelphia company are preparing to put in meters. The fuel has been used extravagantly, simply because it does not cost the consumer any more than the fixed annual rate. Some of the meters for the iron and steel mills will have a regulating capacity of 1,500,000 cubic feet.

Consul-General Raine, in a report to the State Department, says that Professor Serling, a distinguished German authority, in a work recently published, reviews with much care the condition of agriculture in the United States, and comes to the conclusion that, notwithstanding contrary arguments and the greater difficulties at present encountered in America (and he criticises severely our land policy and the acquirement of great tracts of land by capitalists and railroad companies), American competition, after all, must be looked upon as controlling the grain market of the world. The professor states that it is true that the competition of America, as far as Germany is concerned, has become more and more significant.

A Berlin correspondent of the *Indianapolis News* says that meat in that city is 100 per cent. dearer than it is here. He continues: "Although, as a rule, wages here are very low, taken from an American standpoint, living is really higher than in America, especially so in Berlin. Rents are very high, and people live very much crowded, and if it were not for the very strict enforcement of sanitary laws it would necessarily be one of the most unhealthy cities in Europe, while it is in reality the opposite. Bricklayers are trying hard, by virtue of unions, to maintain a price of 12½ cents per hour. Cabinet-makers and upholsterers average 10 cents per hour. Tailors and shoemakers about the same. Servant girls, who, by virtue of laws governing their particular branch, are almost entirely at the mercy of their mistresses, earn on an average about \$38 per annum. Other occupations in like proportion, from the day laborer to the bank cashier. The only redeeming feature in this unnatural state of affairs is that clothing, shoes and amusements are cheaper than in America."

Hiram Sibley, of Rochester, a native of North Adams, Mass., died July 12, aged 81 years. He early manifested a taste for mechanical pursuits, and has left several permanent memorials of his active life, among others Sibley College of Mechanics and Arts of Cornell University and Sibley Hall, attached to Rochester University. He was the first president of the Western Union Telegraph Company, which office he held 16 years. He was a large promoter of business enterprise.

The Jerome Park site being required by the Aqueduct Commissioners, extensive buildings for the Jockey Club will probably be erected in Westchester at a point equally distant from the city. The plans prepared by Thos. R. Jackson, the architect, contemplate an expenditure of \$300,000, the buildings to be entirely of iron, brick and stone.

The Bureau of Steam Boiler Inspection in New York reports that inspectors had examined 1622 steam boilers carrying over 10 pounds pressure, during the second quarter of the year, had tested 1365 and found 101 defective; 26 boilers were con-

demned as unfit for further use. There were 1629 applicants who were examined for engineers' certificates: 1492 stood the test and 137 were rejected. No accidents or explosions occurred during the quarter, a rare occurrence in this city.

An electric system, by which the movement of railway trains while at full speed is automatically regulated, has been introduced successfully on the West Shore line. Briefly told, the system consists in an apparatus adjusted to the rails on either side of the track, and is composed of two springs, which, as they are pressed down by the weight of a passing train, cause a red "banner" in the guise of a semaphore to be exhibited, and this signal stands at "danger" until every wheel has passed out of the block which it entered. At the same time the apparatus registers in the train-dispatcher's office the number of wheels that have gone in and out of the block. The failing of a single wheel to emerge from the block is thus at once signaled, as would happen in the case of a train parting in twain. It is claimed that at the Weehawken tunnel the cost of working this apparatus is but \$75, as against \$3000, the cost of the system formerly in use.

Several years ago a number of German workmen went to Connecticut by a preconcerted arrangement and obtained employment in the clock factories in New Haven, Ansonia, Waterbury, Thomaston and Winsted. They worked steadily for a long time, applied themselves diligently to mastering the science of clock-making and became proficient in the art of handling fine tools. They also purchased tools and several of the complicated machines, and, returning to Germany, they began the manufacture of clocks for themselves. They set up a factory in the Black Forest region, and their business now amounts, according to letters recently received, to nearly 50,000 clocks a month. This German factory has proved a close competitor with the Connecticut concerns in the foreign markets.

The vast stride made by New York City during the past century can be seen by comparing the contents of the first volume of the City Directory with those of the one for 1888-89, just issued. The volume of 1786 contained the names of 846 residents, and that of 1888 contains the names of 835,228 residents. In the former year the population of the city was 23,614, whereas to-day it is estimated that the resident population is fully 1,076,140. The floating population is calculated at 400,000, and a close observer reckons that on each day of the year there are about 2,000,000 persons within the limits of Manhattan Island.

The President having signed the bill creating a Department of Labor, the act has gone into operation. The Commissioner of Labor will now report directly to the President and not to the Secretary of the Interior. No increase in the number of employees is made, and Carroll D. Wright continues to be commissioner.

The President has approved the bill providing for the appointment of commissioners to represent the United States at an international maritime conference, which is to devise ways and means better to secure life and property at sea. The President has accepted the resignation of the Hon. George V. N. Lathrop, United States Minister to Russia, to take effect August 1. Mr. Lathrop is not in good health.

The stupendous plan for supplying the city of Liverpool with water involves the removal of a whole Welsh village, including woods, cottages, churches, &c., this immense space to be devoted to a reservoir $4\frac{1}{2}$ miles long by $\frac{1}{2}$ mile to 1 mile broad

and 80 feet deep. There are to be three lines of pipe, each 68 miles long, with filtering beds and secondary reservoirs, and the cost of the aqueduct alone is estimated at \$15,000,000.

The United States Grand Jury at Springfield, Ill., have indicted the St. Louis, Alton and Terre Haute Railroad Company (Canso Short Line) for violating the postal laws by carrying irregular mails and letters for the Consolidated Coal Company.

The Congressional bill passed by the House for the erection of an appraiser's warehouse in New York City increased the amount of appropriation from \$1,500,000 to \$3,000,000.

Sunset Cox, speaking of the next decennial census, estimates the population of 1890 at near 64,000,000.

Two bids were received at the Navy Department for machine finishing and constructing steel breech-loading rifles for the cruisers Baltimore and Charleston. They were from the West Point Foundry Company and South Boston Iron Works, and were exactly the same—that is, \$3800 for one and \$40,800 for 12.

Whitelaw Reid's newly furnished mansion, erected by Ben Halliday, and lately known as part of John Roach's estate or Ophir Farm, was burned on Saturday, as supposed in consequence of a defective flue. Loss \$500,000.

Report says Commander Folger, U. S. N., will have charge of the new Washington ordnance foundry, and that he will make a tour of all the large ordnance works in Europe before entering upon the local duties of the office. He will be associated with a civilian expert.

The stock of pig iron in Connal & Co.'s Glasgow stores at the beginning of July exceeded 1,000,000 tons, an amount never before reached or considered possible. Not a few in the trade are disposed to look on the accumulation as a wholesome indication, operating as a sort of governor by relieving the market of a surplus at one time and checking speculation at another.

A boudoir on the roof of the Equitable Building, 200 feet above the ground, for the occupancy of President Hyde, will be reached by a flight of gilded iron stairs, and be inclosed in a gilded network of iron, the whole superbly furnished.

The membership of the Knights of Labor, according to statements purporting to come from official headquarters, has dwindled from 729,000 in July, 1886, to 348,672 at the present time.

Icelanders to the number of several thousand are flocking into Manitoba, refugees from intolerable winters and consequent poverty and starvation.

The election of Dr. Juan Pablo to the presidential chair in Venezuela is construed as an omen favorable to closer relations with the United States.

Miss Garrett, the daughter of the Baltimore millionaire, practically directs the management of a property valued at \$20,000,000, and for many years before the death of John W. Garrett was regarded as a sagacious adviser.

The New York State Attorney-General, it is reported, will be invoked to annul the charter of the United States Illuminating Company, who are in opposition to the Board of Electrical Control. According to one statement, supposed to emanate from the telegraph companies, a "deal" was made, whereby the present conduit, which consists of iron pipes, was to be foisted upon the city in the guise of a system properly constructed for receiving the wires. The Subway Company for some reason prevailed upon the commission to

adopt this pipe system, although the commission had decided upon an asphalt concrete system because its engineers had previously reported that asphalt would be less objectionable than iron, and therefore doomed to failure. The charge is made that the Metropolitan Telephone Company have sought to create a monopoly of all electrical service in this city through the means indicated.

The Canadian Pacific Railroad is gradually establishing itself among the recognized great channels of traffic, and is not only overcoming obstacles that arise, but taking a position among Northern railroads, where it may assume an aggressive attitude. The latest achievement is to secure by purchase a controlling interest in the Duluth, South Shore and Atlantic Railroad, thereby obtaining possession of an American and Canadian systems of no less than 6500 miles. The road is expected to take a larger share of local business from Lake Michigan ports. Still another advance step is the building of the Sault Ste. Marie and Southwestern road, for which, according to a Montreal dispatch, funds have been secured. It is intended to construct the link between the Union Pacific and the Canadian Pacific railways, giving the former, by a traffic combination now being arranged, a line eastward to tidewater from the Missouri River 250 miles shorter than any now operated, and giving the Canadian Pacific entrance into territory southwest of its present system in Manitoba and Ontario.

Cleveland papers bring accounts of an alleged mammoth syndicate, well supplied with English capital, who propose to build a fleet of ore steamers and monopolize the trade of the Lakes in that department of enterprise, but the scheme does not appear to have a substantial foundation.

Consul Cabro, representing the Argentine Republic in New York, speaks of the rapid increase of the carrying trade between the two countries. The Republic, he says, look to the United States for almost everything that is wanted. All kinds of machinery and agricultural implements come from this country, being cheaper and of a superior quality, but in the absence of direct steam communication it was found necessary to contract for shipments via Liverpool and London.

Claus Spreckles is reported from San Francisco to have scored a point with the sugar trust in his first onset by buying 50,000 tons of raw sugar, cornering the market, and realizing \$40 per ton or \$2,000,000 profit from the transaction.

The Manhattan Athletic Club intend to erect an elegant club house on Madison avenue and Forty-fifth street, to cost \$300,000 exclusive of the land. It will be 125 feet square.

The Senate proposes to add \$800,000 to the post office appropriation bill for the encouragement of American steamship transportation, but the House is strongly opposed. Foreign lines volunteer to perform the service for less money, but a nursery of American seamen is desirable, as a provision against future trouble.

At the annual meeting of the Rome Merchant Iron Mill, Rome, N. Y., the officers elected for the ensuing year were Jim Stevens, president, Wm. Stevens, vice-president, Chas. W. Lee, secretary and treasurer, Samuel Southall, superintendent, and Jay Hildrith, agent. The company have steadily enlarged their works during the past year, having lately built three additional double puddling furnaces, which, with other improvements, have materially added to their capacity. They are running full in all departments and are well supplied with orders.

MANUFACTURING.

Iron and Steel.

The Pittsburgh Forge and Iron Company, of Pittsburgh, whose works are located in Allegheny City, are attempting to run the forge department of their mill with non-union men. Some time ago the firm proposed a reduction of 10 per cent. to all employees not members of the Amalgamated Association. The men refused to accept the reduction and the works were closed down. It is stated that more than half the old employees are at work, having accepted the reduction. The resumption of work does not affect the Amalgamated Association. Nothing will be done about their scale for the present. James K. Verner, secretary of the company, has made the following statement as to their future intentions: "We have started the forge and mean to run it. We will run it at the reduction or not at all. We will not sign the Amalgamated scale. After we get things in first-class working order with the other we will turn our attention to them."

The nail factory of the Wheeling Iron and Nail Company, at Wheeling, W. Va., has been closed down for an indefinite period. The blast furnace of this company was also blown out on the 1st inst. for the purpose of being relined and repaired. It has made an excellent record, having been in blast continuously since November, 1885, on one lining. It will resume operations again about October next.

The Laughlin Nail Company, of Wheeling, W. Va., whose extensive works are located at Martin's Ferry, Ohio, are endeavoring to complete their usual summer repairs with the view of resuming operations at the earliest moment possible. This company are enjoying an unusually brisk trade this year, and are disposing of their product as fast as it is made. Their factory contains 192 nail machines, and for the past six months their output was over 180,000 kegs, while their shipments for the same period amounted to 190,000 kegs.

Furnace No. 1 of the Stewart Iron Company, Limited, at Sharon, Pa., was blown out Tuesday, the 10th inst., owing to the unsatisfactory condition of the iron market. The company have a very large stock of pig iron on hand with very little demand for it. The furnace will remain idle until there is a decided improvement in the business situation.

The Ensign Mfg. Company, Huntington, W. Va., have received an order from the Baltimore and Ohio Railroad Company for a large number of car wheels for their road, to be delivered in installments of 2000 per month.

The Cartersville Iron Furnace Company, of Cartersville, Ga., have been chartered by John Postell, D. W. R. Peacock, Geo. A. Patillo and others, with a capital of \$25,000.

The Eliza Iron Company, of Wellston, Ohio, operating the Eliza furnace under lease, will put the furnace out of blast in the course of two or three months and will retire from business, on account of the depression in the iron trade. The company state that the cost of manufacture of pig iron at present is over and above the price obtained for it, which is the reason for the above step. Wellston Furnace, also located at Wellston and operated under lease by King, Gilbert & Warner, of Columbus, Ohio, was blown out on Saturday, the 7th inst., for an indefinite period. Milton Furnace, owned and operated by the Milton Furnace and Coal Company, at Wellston, will also be blown out at an

early date. The above-named furnaces, three in number, comprise all the blast furnaces located at Wellston, and in a short time they will all be idle.

The Peerless Mfg. Company, of Louisville, Ky., have issued a catalogue consisting of some 25 plates, presenting a great variety of artistic iron linings and portable basket grates. The designs are very handsome, and give evidence of great care in their execution.

The plant of the National Tube Works Company, at McKeesport, Pa., resumed operations on Thursday the 12th inst., after an idleness of about ten days for repairs.

The Granite Iron Rolling Mills of the St. Louis Stamping Company are undergoing repairs, which will be completed in about three weeks. No exchange of views with employees of the mills looking to a resumption of operations under any scale of wages has been had.

The creditors of Graff, Bennett & Co., of Pittsburgh, have made application to Court for the sale of the three iron mills of the firm. The Court ordered the sale of all the property on 20 days' notice. The mill properties of Graff, Bennett & Co., are among the most valuable in Pittsburgh. One is located on the South Side, and the other at Bennett Station, on the West Penn. Railroad. They also owned the Clinton furnace in Pittsburgh, and were interested in the Grafton furnace at Leetonia, Ohio.

The St. Louis Sheet Steel and Iron Post Company, of St. Louis, have filed articles of incorporation, with a capital stock of \$500,000.

Lean & Blair, engineers and contractors, of Pittsburgh, have received a contract from the Union Rolling Mill Company, of Cleveland, Ohio, for the erection of five large heating furnaces and a gas-producing plant complete. These works have heretofore run on coal, but will change to gas.

As reported in our last week's edition, the Laclede Rolling Mills will be closed down for an indefinite period in the early part of this month, the present operators, the Laclede Plate and Sheet Mill Company, not caring to renew their lease, which has already expired.—*Age of Steel*.

At the Philadelphia Bridge Works of Cofrode & Saylor, at Pottstown, Pa., new hours of labor went into effect on Monday the 9th inst., to continue until further notice. Instead of working from 7 until 12 and 1 to 6, the hours will be from 6 to 12 and to 6 five days of the week, and on Saturday commence at 6 and quit at 11 a.m. for the remainder of the day.

The Bethlehem Iron Company have made a proposition to the men that if they are willing to share with the company a reduction in prices which would be covered by a reduction varying from 5 to 20 per cent. in wages in the different departments, the company on their part hope to be able to provide reasonably steady work during the balance of the year. This applies to the steel mill and old rail mill, but not to the puddle mill. The men have accepted the proposition and the works have resumed operations.

Machinery.

Mr. C. E. Torrance has purchased the interest of Messrs. Pattee & Draper in the Holyoke Hydrant and Iron Company, Holyoke, Mass., and will continue the business as heretofore under the name of Holyoke Hydrant and Iron Works, C. E. Torrance, proprietor.

Mr. J. D. Thomas, representing the Westinghouse Machine Company of Pittsburgh, has departed for Rome, Italy. The

object of his visit there is to introduce the Westinghouse system of electric lighting. Some time ago six dynamos, manufactured by that company, were sent to Rome and Turin. These machines will be put in operation by Mr. Thomas, and an electric-lighting plant erected in both the cities named.

The Oil Well Supply Company, Limited, of Oil City, Pa., have just received from the East a large drop hammer, which is believed to be the largest in this country. With this hammer and several of smaller capacity, the company are now prepared to do heavy drop-forged work, and at present are at work on an order from New York parties for drop forgings for a patent car-coupler.

A dispatch from Youngstown, Ohio, under date of the 8th inst., reads as follows: "Work will be commenced to-morrow on the new shops of the New York, Pennsylvania and Ohio Railroad at Brier Hill. The contract for their construction has been awarded to Drake, Shattuc & Co., of Pittsburgh, who also have the contract for the double-tracking of the road from here to Cleveland. The company have bought 36 acres for the shops, and expect to have them ready to be occupied by November 1."

The new twin-screw propeller, Monmouth, from Philadelphia, was entirely successful on her trial trip to Sandy Hook. She is 931 tons burden, with four boilers and improved engines. She cost \$250,000, and it is expected that she will develop a speed of 16 knots an hour. One special feature in the construction of the boat is the adoption of the twin-screw propeller. Her length over all is 270 feet, her width 48 feet and depth 15 feet. The cylinders are 19, 30, and 50 inch diameter by 30 inch stroke of piston, and are expected to develop 2500 indicated horse-power, with a steam pressure of 160 pounds. Piston slide valves on all the cylinders are worked by the Marshall valve gear, the air pumps are driven off side levers and the centrifugal circulating pumps driven by independent engines.

The Howe Scale Works, at Rutland, Vt., were sold at auction the 12th inst., for \$441,283. The sum includes the amount of liabilities, \$201,133, which are assumed by the purchasers. The new owners will take possession within 60 days. Work will go on without interruption.

The Laidlaw & Dunn Company, Cincinnati, Ohio, have been awarded the contract to furnish all the necessary pipes, fittings, valves, heaters, pumps, &c., for the large new works of the Addyston Pipe and Steel Company, now being in course of erection at Addyston, Ohio.

A newly formed company, with ample capital, have purchased Dr. Raub's patent for his central power engine, the first of which was constructed at the Grant Works some two years since, and which, it is claimed, has proven a very great success. It is said that ten of the engines will be built at the Grant Works as soon as the new company are ready to begin operations.—*Paterson (N. J.) Daily Guardian*.

The Curtis Regulator Company, of Boston, Mass., report increasing foreign sales, among which, within the last few weeks, are two damper regulators in England and in Denmark. They have sold, also, 18 steam traps and six pressure regulators; also damper regulator of 200 horse-power for the Congaree Mfg. Company, Columbia, S. C.; a 4-inch steam separator in New York and one 6-inch and an 8-inch steam separator to the Tremont Nail Company, of Boston.

Hardware.

The Columbiana Handle Company, Columbiana, Ohio, who bought out the Leetonia

Tool Company, the first of the year, have built a new shop, 121 feet long and 40 feet wide, which they are now occupying. The works are situated on the main line of the P. F. W. and C. R. R. They report a good trade, domestic and foreign.

The Cincinnati Wire Company, Cincinnati, Ohio, whose factory, as we have already noticed, has been idle for a short time, in order to take inventory and make alterations, have resumed operations and will run it to its full capacity for the balance of the year.

The St. Louis Vise and Tool Company, of St. Louis, have increased their capital stock from \$5300 to \$30,000. Its assets are reported to be \$47,661.78, and liabilities \$15,781.64.

The Freeman Barb Wire Company, of East St. Louis, who employ about 125 men, cut wages about 20 per cent. on the 13th inst., and the result was a strike, and 100 men left the shops. The wages ranged from \$2 to \$3 per day, and there was a cut of 50 cents all around. The company expect to fill the strikers' places.

The Belleville Nail Company, of Belleville, Ill., have notified the Secretary of State of Illinois of an increase in their capital of \$100,000 to \$300,000.

Miscellaneous.

The Pittsburgh Natural Gas Company, of Pittsburgh, have been incorporated, and have already begun work on their line from the gas field at Murrysburg to Pittsburgh. The new company start with a capital stock of \$350,000, and the stock is all held by members of the firms of Park Brothers & Co., Limited, of the Black Diamond Steel Works, Pittsburgh, and William Clark's Son & Co., also of that city. The company own a considerable block of gas territory in the Murrysburg district, and as the two firms mentioned compose the firm they will henceforth furnish their own fuel. The contract for the laying of the pipe has been let to Gwinner & Co., and the work is now in progress. The line will be 19 miles in length. The first 7 miles will be of 12-inch, and the remaining 12 miles of 16-inch pipe. The contract for the 12-inch pipe has been let to Dennis Long & Co., of Louisville, Ky., and the 16-inch pipe is being made by the National Tube Works, at McKeesport. The work will be completed before autumn. It is estimated that the cost to the two firms for fuel under this plan will not be more than one-half what it is at the present time.

It is announced that the Westmoreland Coal Company, of Irwin, Pa., will build a new car shop at that place that will give employment to about 100 men. The firm will build their own cars, which are now made in the East.

Portsmouth, N. H., claims to have the largest shoe manufactory in the world, paying out to their employees \$35,000 every month. They have also an extensive machine shop, employing a large number of skilled mechanics.

The following corporations have been authorized to transact business in Illinois: The F. C. Austin Mfg. Company, of Chicago; capital, \$150,000; for the manufacture of all kinds of road-building, well-building, mill and farm machinery; incorporators, Frederick C. Austin, Elbert H. Cary and Thomas C. Chapman. The Universal Mfg. Company, Chicago; capital, \$12,000; to manufacture heaters and burners of petroleum for cooking purposes; incorporators, J. Howland Silvera, Arnold Brecher, Henry D. Duff and Sumner Stowe Ely. The Goodrich Mfg. Company, of Chicago; capital, \$20,000; to manufacture sewing machine attachments; incorporators, Charles W. Rhodds, Almon W. Bulkley and Edward E. Gray. The Lake Shore

Foundry Company, of Chicago; capital, \$15,000; to conduct a general foundry business; incorporators, P. H. Meehan, R. D. Wardwell and Oscar Ludwig.

The engine house at the Florence iron ore mine, at Florence, Wis., was totally destroyed by fire on the 13th inst. The engine house contained about \$75,000 worth of machinery, including five engines and hoisting drums, four boilers, two compressors, two pumps, &c. The building was valued at \$1500. The building and machinery were insured for \$14,000, which, it is believed, will cover the loss, as the boilers and pump and three of the engines and drums are not thought to be seriously damaged. Temporary boilers have been procured so as to keep the mine free from water. An air compressor will be working in a few days, when hoisting will be resumed.

The Lockout Nearing An End.

Judging by the rapidity with which the Amalgamated scale is being signed by the Western iron manufacturers, it is safe to assert that the close of the present month will find a majority of the mills in operation at the terms proposed by the Amalgamated Association, and the lockout practically ended. While the prediction may seem strange in view of the apparent firm stand taken by the members of the Western Iron Association at their recent conference meetings, it is nevertheless true. Although the month is little more than half gone, more than 25 firms have already signed the scale and their works are in operation. It is not to be expected that the balance of the manufacturers who have thus far refused to sign the scale will be content to allow their mills to remain idle while their trade is being taken by competitors who have resumed. While it is true that some of the manufacturers may hold out for some time yet, it will be because their repairs are not completed, as they could not operate their mills at present if they wished to do so. The admission must be made that the Amalgamated Association have scored another victory at the expense of the manufacturers.

The manner in which the lockout has ended has already caused considerable ill-feeling between some of the manufacturers and the early disruption of the Western Iron Association is hinted at as the result. While we do not believe that this will take place, there is no denying the fact that there is dissatisfaction and that it may result in the withdrawal of a number of firms. The announcement is made that at the next meeting of the association Chairman A. F. Keating will resign his position and that the firm of Zug & Co., Limited, of which he is a member, will withdraw from the organization. Their course will no doubt be followed by others. The dissatisfaction is said to be particularly strong among the manufacturers of the Shenango and Mahoning valleys and the severing of the connection of a number of firms from these sections will no doubt take place. The claim is made that the manufacturers in the above-named places have for years stood with the Pittsburgh manufacturers and engaged in strikes on the promise that the latter were strongly united, and, with the assistance of the outside manufacturers, the Amalgamated Association, could be defeated. When the real test came, however, the Pittsburgh manufacturers were the first to give in and sign the scale. In the future they propose to act independent of the Western Iron Association and will not be governed by it in any way.

Another report has been vigorously circulated to the effect that if the scale is not satisfactorily arranged next year at the conference meetings each member of the Western Iron Association, should it be

in existence, will be required to put up the sum of \$20,000 to bind any compact that may be made. An effort will also be made to include the steel manufacturers in this, as the fact of so many steel firms signing the scale as soon as presented has a tendency to weaken the iron manufacturers and cause them to agree to the terms presented in order to protect their interests. The report further states that this \$20,000 will be forfeited by any firm who signs the scale without being authorized to do so. The truth of this report has been earnestly denied by several manufacturers, and we do not attach much value to it, for the reason that the manufacturers would hardly be laying out a plan of campaign for another lockout until the present one is definitely settled. It is a well-known fact, however, that the manufacturers went into this conflict without being sufficiently united to stand a long suspension of work, and it does not seem strange, therefore, that they have been defeated. A large number had positively refused to state whether they would sign the scale or remain idle, while others said that if certain firms signed that they would also be compelled to do so, in order that they could protect their interests. The following named firms have signed the scale in the order given, in addition to those noted in our last issue:

Jones & Laughlins, Limited, Pittsburgh, Pa.
Central Iron and Steel Company, Brazil, Ind.
Brown & Co., Pittsburgh, Pa.
Long & Co., Pittsburgh, Pa.
Licking Rolling Mill Company, Covington, Ky.
Ohio Falls Iron Works, New Albany, Ind.
National Tube Works Company, McKeesport, Pa.
Jennings, Beale & Co., Limited, Leechburg, Pa.
New Philadelphia Iron and Steel Company, New Philadelphia, Ohio.
North Chicago Rolling Mill Company, Chicago, Ill.
Falcon Iron and Nail Works, Niles, Ohio.

The Commercial Club, of Louisville, Ky., which, as a means of developing various industries, has never had an equal in that State, has aroused enthusiasm enough among the merchants and manufacturers to inaugurate a new movement to advertise the city's business and advantages. A committee have been appointed with plenty of money to draw from, and will act with a well-known expert to arrange for a "Fall Celebration," which will be on the plan of the Mardi Gras of New Orleans, only it will last many more days and be more varied. The yearly expositions are among the things of the past, and, as something is needed to keep the city abreast of her neighbors and attract strangers, it is decided to institute the celebration with a view to make it a regular occurrence. The exact limit and scope have not yet been developed, but it will be on a grand scale.

The Sessions Foundry Company, of Bristol, Conn., are about the largest strictly jobbing foundry in New England. Their line is especially small or benchwork castings, although they make large quantities of other work. During their business year, which ended May 1 last, the amount of their freight received and shipped was upward of 12,000 tons, which furnishes an idea of the magnitude of their business. They make a specialty of a fine quality of iron and smooth, well-molded castings.

The rail mill of the Western Steel Company, at St. Louis, closed down on the 12th inst.

The Iron Age

New York, Thursday, July 19, 1888.

RICHARD R. WILLIAMS, - - - HARDWARE EDITOR.
JOHN S. KING, - - - BUSINESS MANAGER.

It is a curious fact, and a deeply interesting one at this time, that the selling price of steel rails at English works is not more than the mere cost of the labor employed in the production of steel rails in the United States. This has been demonstrated by the figures of one of the leading rail mills of this country. Their entire product for 1887 was considered in the calculation, which embraced all the materials used, beginning with the mining of coal, ore and limestone. The labor employed in the production of minor articles in the shape of mine, furnace and mill supplies was not included, as it would have to be estimated, but the labor entering into the preparation of the leading materials and their manipulation was a matter of almost exact computation. The difference in the cost of manufacturing steel rails in this country and abroad is strikingly shown in the above statement, as the selling price of English rails necessarily includes profits on the preparation and manipulation of the various materials. The only true way to get at the cost of labor entering into the production of an article is to follow it up from its crudest form. In the case of a steel rail the labor does not begin at the pig, the steel ingot or the bloom, but it begins at the mine.

The Copper Situation.

The English newspapers, echoed by a number of our own daily press, are earnestly endeavoring to create the impression that the famous French syndicate is on its last legs. They marshal an array of figures, formidable enough, it is true, to cause some alarm, and affect to believe that it points to an early collapse of the gigantic speculation. It may be confessed that if they keep at it long enough they must ultimately be in a position to point with pride to the verification of their predictions. We doubt whether there are many fair-minded people familiar with the copper trade who would not be willing to go on record as prophets of a fearful break in copper at some indefinite future period. With the exception of a few mine owners who are reaping a golden harvest, the trade in the United States is bitterly opposed to the manipulators of the metal, because they are causing some restriction of consumption and because ultimately a very severe and prolonged depression must follow. They know that the consumer is paying a heavy tribute to foreign speculators.

However unpopular the operations of Secrétan and his backers may be it would be unwise to assume that the clique is losing its grip now and that they are on the verge of a panic. Their control of the situation is too powerful as yet. Their contracts with mining companies embrace the following tonnage, our table giving the prod-

uct of 1887, the output of 1888, as estimated by one of the leading authorities in the world:

	Merton's product 1887 Gross tons.	Estimated prod- uct 1888. Gross tons.	Syndicate con- tracts 1888. Gross tons.
Algiers.....	150	150
Argentine Republic.....	170	170
Australia.....	7,700	10,000	4,000 Cobar, Moonta
Bolivia.....	1,800	2,000
Austria.....	700	1,000
Canada.....	1,400	2,000
Chili.....	29,150	35,000	3,000 (Panulcillo)

So far as is known all but the Japan and the Anaconda contracts are for three years, those named being for one year only. To this may be added practically the whole of the Chili product outside of the Panulcillo, say 32,000 tons. Though this copper is not contracted for, it is bought in Chili or from importers in England at the time of shipment or on arrival in England. It is estimated that the syndicate now holds over 45,000 tons, in addition to about 20,000 tons of English copper. A review of the status of affairs so far as the remaining quantities are concerned shows the following: The product of Austria, Hungary, Germany and Russia, in all estimated at 22,500 tons for 1888 is taken care of by local consumption. This leaves an estimate of 38,090 tons of outside floating copper from all sources, which the syndicate must either take care of ultimately in some shape or other or which cuts out so much metal from the trade of the companies controlled by it. That it is doing so is proven by the statement made in the last circular of Messrs. James Lewis & Sons, of Liverpool, who state that little of the Rio Tinto, Tharsis and Cape copper produced at the smelting works of those companies during the first six months of 1888 has been sold, the stock thus accumulated being the 20,000 tons of English copper already referred to.

That the speculators are carrying an enormous burden is certain. All the producing countries of the world are industriously pushing supplies to the European markets. For the first six months of 1888 the imports of copper into England, France and Italy, exclusive of pyrites and precipitate to English outports were 64,896 tons fine, against 40,049 in 1887, and 50,925 tons for the first six months of 1888. Of this the United States is credited with 8690 tons in 1886, 7220 tons in 1887, and 19,209 tons in 1888. By far the

greater part of it, not less than 16,803 tons fine, has come from one mine, the Anaconda, of Butte City, Mon.

While supplies have thus materially increased and deliveries have fallen off must not be forgotten that the statistics visible supply are to some extent misleading. During the eight months since the famous upward rush of copper, stocks of raw materials and of manufactured goods in all manufacturing countries have been run very low. The whole world has scoured for old copper and old brass in every imaginable form, and that substitute for new metal is now pretty nearly exhausted, too. Therefore, while production is increasing, consumption of new metal too, must prove heavier, though it must be far below the accumulating supplies.

One important consideration is evidently forgotten by those who are talking of an early collapse of the metal. While the syndicate has reserved special powers for ordering a reduction of output in only a few of its American contracts, it may readily be conceived that it might succeed in bulldozing other contracting mines into lessening production. A threat to involve them in the general loss which would follow the failure of the Société des Métaux and the syndicate might make them willing to aid it by some sacrifices of output. It is believed by good authority that when the break should come, £30 for Chili would not be an unusual figure for some time. Rather than see such a calamity come about the large companies might be willing to strengthen the hands of the speculators by agreeing to restrict production. So far that contingency has not arrived, but it is likely to precede a serious decline.

Domestic Motors.

Within the past six or seven years development in the line of what may be some reason be termed domestic motors has been unusually rapid, and in addition to several of the older and already well known engines of this type a large number of new forms have been brought into extensive use. We need perhaps scarcely explain that under the head of domestic motors may be embraced those engines which are mainly designed with the view of being intrusted to unskilled management, and which accordingly dispense with the use of an independent power generator, such as a steam boiler. It is interesting to note, however, that the demand for such engines has not been limited to those who cannot provide for attendance with any engineering qualifications without speaking of, but has extended to a large number of power users who have found that such motors efficiently meet their requirements. The application of small engines of special make to such home service as pumping water and running ventilators and sewing machines is familiar, and has apparently had the effect of demonstrating that even larger powers, required for the heavier work of operating printing presses, small machine shops, electrical light installations, &c., can be satisfactorily obtained without resorting to steam engines or to water-wheels which require special location and usually expensive accessories.

At the present time the gas engine undoubtedly performing the largest share

of the work done by the whole class of domestic motors, so-called, and, in many instances, has shown itself to be a formidable rival of the steam engine, successfully driving machinery for which only a few years ago it was considered not at all well adapted. In capacity the engine has experienced a steady increase, the originally small sizes of fractional horse-power, and of one, two and five horse-power, though still turned out in large numbers, having been followed by 10, 20, and, quite recently, even by 50 horse-power engines—ample evidence of the growing popularity and fitness of the motor for comparatively heavy duty. From the single-cylinder engine it was but an easy transition to a design calling for two cylinders, and this again prompted the building of four-cylinder engines, some of which, of the Otto type, have been turned out abroad, the aim being, we understand, to secure greater regularity of working and higher economy in point of gas consumption. We do not know whether these designs accomplished all that was expected of them, but, in any event, the increased cost of maintenance and the complication of parts which they naturally entailed, detracted, in some measure, from their claim of belonging to a class of engines which required no skilled attendant and which were not subject to frequent derangement. Simplicity of construction is a very important matter—in fact, it is of the first importance in any engine which is to suffer the abuse of untrained handling, and, despite some of its shortcomings, the single-cylinder gas engine will, therefore, in all probability, remain in favor for some time. This seems to be borne out, moreover, by the fact that nearly all the recent designs are of this type, a circumstance of which the weight will be all the more appreciated when it is considered that such designs have been brought out in large number, foreign engineers having been particularly active in this respect.

Closely allied to the gas engines are the various forms of petroleum motors, which have been given prominence of late. In these a mixture of air and petroleum in the form of vapor or spray is introduced into the cylinder and fired. Where a supply of gas is not available, these engines offer special advantages, and would seem to be assured of a favorable reception; and it is but natural therefore that both in this country and abroad their introduction is being vigorously prosecuted.

Hot-air engines are now so well known that we need scarcely more than mention them here. Their principal use hitherto has been confined to pumping water in buildings, for which purpose they are peculiarly well adapted and extensively manufactured, one works alone in New York turning out about 600 per annum. While it is questionable whether for the present they will be employed to any very great extent for general low power purposes, it is interesting to note that they are built by several engineering firms with this end in view, and are also employed in the English and in the United States lighthouse service for compressing air for operating fog-horns. Their simplicity and convenience are generally recognized, but these good features are in a measure overshadowed by the fact that, compared with other motors of equal power, they are large and cumbersome pieces of machinery.

In the line of water motors there has been no lack of progress, and small power users now have the choice of a large number, all of them being claimed to be efficient and generally satisfactory. In some localities where a comparatively high water pressure is maintained in the city supply pipes, these motors have been used to the exclusion of many small engines of other types designed for similar work, and, to all appearances, with very good results, their entirely harmless character, ease of management and cleanliness tending largely to make them popular.

One of the later arrivals in the field of small engines for household and other uses is the electric motor, of which the wide range of usefulness is at once apparent. Its application to driving elevators and ventilating fans has secured for it a fair proportion of public favor, and has more recently been followed by its adaptation to pumping and other work of a general character. For obvious reasons, however, its use is at present limited to special localities. Before leaving the subject we cannot but refer to the several forms of small steam engines which are now on the market, and which, while embracing steam generators, have been designed specially with the view of being managed by unskilled attendants. The boilers are heated by kerosene, and the whole outfit is perfectly automatic in its working, the regulation of the fires, steam-pressure, water-level, &c., being entirely independent of the attendant. The element of danger from carelessness or ignorance is thus practically eliminated, and the engines are not without just claims to a place in the class of motors which we have considered.

A shipment of 600 tons of Lake Superior charcoal pig iron was made to England last week by the Elk Rapids Iron Company, of Michigan. The sale was negotiated by F. H. Head, of Chicago, vice-president of the company, who has conducted similar transactions in years past, although this is considerably the largest. Mr. Head states that such shipments are only possible in times like the present, when the price of charcoal pig iron is very low. Swedish charcoal pig iron is used to a limited extent in England in the manufacture of some grades of steel and of malleable castings. Its price does not fluctuate so much as the price of pig iron in this country, consequently high prices here cut off all chances of trade in that direction, while a return to low prices here renews the opportunity to compete. The price to be met is about \$22 per ton at Liverpool. The freight rate secured on the Elk Rapids iron from the furnace to Liverpool is understood to be \$4 per ton. It is carried wholly by water, going to New York by lake and canal. At New York it will be transferred to a steamship of the Inman line. It will be seen that the price netted is the ruling rate for Lake Superior charcoal pig iron at furnace. Part of the iron will go to Derby, England, and part to other points of consumption in that country. Our readers generally do not need to be informed that this shipment of pig iron from America to England is of a special character, and that it does not mean a serious invasion of the English home market. Probably one Michigan blast furnace would be able to keep England supplied

with all the charcoal pig iron required, as its use is quite limited. It would seem to be needed for malleable iron castings to a great extent, but they are not so widely used in England as in this country, owing to the cheapness of forgings answering the same purposes.

The Railroads Projected in Porto Rico.

Since American enterprise undertook railroad building in Mexico some ten years since, and endowed that country with a system now exceeding 6000 km., other nations begin to take in hand similar undertakings in countries South of us, in which nothing of the kind had been attempted, although it was more than probable that they would prove as remunerative there, perhaps even more so. Strange to say, the lesser Spanish Antille, Porto Rico, although the most populous Spanish colony, has so far been overlooked, and has been without a mile of railway. Now, however, a railroad is to be built without delay to run along the entire coast. The engineering obstacles to be overcome will be slight, comparatively speaking, nor will there be much difficulty in procuring workmen at moderate wages on the spot. A great impulse will be given to the development of agricultural and pastoral interests in the island by the railroads planned, a matter of no small interest to American trade, our export of domestic products increasing in that direction at a rapid pace. The planting interest centers upon the three chief products, sugar, coffee and tobacco. Sugar is cultivated along the entire coast, and the quality is very fair; coffee is grown in the mountain districts, also of a most desirable quality, while the tobacco culture occupies small farmers on the plateau, and produces a merchantable leaf of medium quality. Sugar has been so low that at times planters have found it difficult to make the two ends meet, but some of them partially resort to rum distilling, thereby improving their income, a few distilling even bay rum. Coffee has paid the planters well during the last two years, and in some shape or another the population manages to flourish more than elsewhere in the West Indies, which accounts for their taking American goods more freely.

There is no difficulty about labor; the 90,000 freedmen all work at moderate wages, and so do the white working classes. While the island has only an area of 9314 sq. km., the population numbers 900,000, having increased as follows:

1834.....	258,836	1867.....	731,648
1846.....	443,139	1883.....	810,394
1860.....	583,308	1887.....	900,000

The population of the cities is as follows: Ponce, 37,545; San German, 30,146; Mayagüez, 26,446; Arecibo, 25,754, and St. Johns (the capital, a fortified place), 23,414. The concession to build the 546 km. of railway, 468 of which to run along the coast, was granted at Madrid by adjudication on March 5 last for 99 years in the round sum of 49,640,000 pesetas or francs and comprises the ensuing localities and distances from St. Johns to Mayagüez via Arecibo and Aquadilla on the northern coast 185 km.; from Mayagüez to Ponce via San German, 90 km.; from Rio-Piedras to Humacas via Fajardo, 96 km.; from Ponce

to Humacas via Arroyo, 125 km., and from Caguas to Humacas via Juncos, 0 km. The last four lines connect the western coast with the eastern through the southern and partially through the interior. The Spanish Government guarantees 8 per cent. interest per annum on the sum of money named. The Porto Rico Railroad Company were formed at Madrid on May 17, 1888, and on June 8 the Government confirmed the concession as vested in the company named, thus incorporating the same. The share capital of the company is 16,000,000 pesetas or francs, and a contract was made with the Porto Rico Railroad Company to commence building at once the 275 km. from St. Johns to Ponce via Mayagüez, that being the most important line. The construction company have a share capital of 2,500,000 pesetas.

There being 95 inhabitants to the square kilometer in Porto Rico, prospects of a large traffic are most encouraging, since in France there are only 72 inhabitants per square kilometer; in Portugal, 48; in Spain, 32; in Cuba, 18, and St. Domingo, 11.

The island being comparatively small there are only 833 km. of telegraphs in operation, with 35 offices, of which 14 are Government and 21 are municipal, the island being divided into 71 municipal districts. The Porto Rico sugar crop was large last year, when 81,355 tons were exported. The United States received 131,443,632 pounds of it. In 1886 only 59,333 tons were shipped, and in 1885 the shipments reached 88,959 tons. In the latter year there were also shipped 21,669 tons of coffee, 80,645 tons of molasses and 3495 tons of tobacco. Cattle exportation to other W. I. islands is also considerable. The import into the island in 1885 was \$11,745,022, against \$13,132,293 in 1884; the export was \$14,048,639, against \$11,618,888. There entered in 1885 1648 vessels of a joint tonnage of 108,896, and sailed 1544 with 147,125. American trade increased as follows:

Calendar year.	Import from Porto Rico.	Domestic export.
1887.....	\$4,515,684	\$1,883,079
1886.....	4,093,245	1,579,148

The budget for 1887-88 estimates the income of the island at \$3,550,372 and the outlay at \$3,551,841.

An agreement has been arrived at between the United States and Spain, prolonging the existing commercial arrangement having reference to the Spanish colonies, pending the conclusion of a more ample treaty. The agreement may be terminated on two months' notice being given by either side.

The evidence thus far brought out concerning the alleged dynamite conspiracy among discharged employees of the C. & Q. Railroad Company, members of the Brotherhood of Locomotive Engineers, is exceedingly damaging to that body, unless it can be proved that they have no complicity in the plot. It is essential to their reputation as law-abiding citizens that the circular signed "S. E. Hoge, chairman of the General Grievance Committee," calling for men "to disable engines in every way they can," &c., shall be proven to be a forgery. Thus far five engineers are under arrest and General Manager Stone of the railroad company tells a startling

story respecting the character and extent of the plot with which they are declared to be prominently identified. The best course for the Brotherhood is to repudiate all connection with this alleged diabolical business, and as evidence of their good faith lose no time in "calling off" a strike that only serves to foster the worst passions of men, besides affording a standing example of insubordination and lawlessness for which there is no possible justification. As the case stands it looks very black for Chairman Hoge and his friends, and his overtures for a compromise coupled with the menace of a general strike should the railroad company continue its "persecution" (prosecutions), can hardly relieve the strain of the situation. In truth, should not any form of bulldozing be indignantly spurned? The Brotherhood, at least as individuals, entirely repudiate all connection with the infamous plot now plainly revealed, and beyond any question are prepared to sustain the laws, in common with the community at large, as against any form of anarchic devices.

All-Rail Shipments of Lake Superior Ores.

Attention having frequently been drawn to the probable transfer of a considerable proportion of the iron ore tonnage of the Northwest from lake vessels to all-rail routes, we have collected information on the subject from the railroad lines interested. The result of these inquiries is somewhat disappointing to those who believed that a very considerable share of this trade had been diverted from its old channel. We find that the entire all-rail shipments of Lake Superior ores to Milwaukee and points south of that city amounted to but 75,349 gross tons between December 1, 1887, and May 1, 1888, against 99,385 tons between December 1, 1886, and May 1, 1887. These figures show not only the limited extent of the all-rail movement of Lake Superior ores, but also a decrease in the past season as compared with the previous one. This, however, should not be taken to indicate the course of trade in the future, special reasons existing for the decrease, which will be noted hereafter.

The railroad companies over whose lines the ore was hauled embrace the Chicago and Northwestern and the Milwaukee and Northern, from the Menominee and Marquette districts, the Chicago, Burlington and Quincy with the Chicago, Burlington and Northern, from the Vermillion district, and the Milwaukee, Lake Shore and Western and the Wisconsin Central, from the Gogebic district. The bulk of the tonnage was hauled from the Gogebic mines—namely, 96,936 tons in 1887, and 67,391 tons in 1888. The Vermillion mines made no all-rail shipments in 1887, this movement with them beginning in 1888.

With these figures before us, and a knowledge of the condition of the iron trade, it is easy to account for the falling off in all-rail shipments in the past season. In 1886-87 the demand for iron ore was very heavy, owing to the prosperous condition of almost every branch of the iron business. The Gogebic mining district was also in the full enjoyment of its boom, and mine owners were pushing the work of developing new deposits, in order to

help the sales of mining shares. During the past season, however, the iron trade was dull and depressed, and for a considerable part of the winter the output of the iron and steel works of Chicago and vicinity was greatly restricted, so that much less ore was consumed. The collapse of the Gogebic speculation also stopped shipments from all but the southern and properly worked mines. This change in the condition of affairs came very suddenly after the all-rail movement had been inaugurated. If it had been delayed two or three years the results would have probably been more in harmony with the expectations of the believers in the ultimate absorption of the ore-carrying trade by the railroads. The first points the railroad companies had to demonstrate were cheapness of service in comparison with vessels and the assurance of reliable winter deliveries when vessels were unable to run. Both have been very satisfactorily demonstrated by this time, and the foundations are therefore, laid for the future. Although vessel rates are much lower this summer than they were last year, ore shipments are now being made by rail and will continue the whole year round.

This significance of this change in the methods of transportation is of great importance than simply a transfer from one set of freighters to another. It means the manufacture of pig iron in the Northwest under more favorable conditions than have heretofore existed. Under the old system a sufficient quantity of ore had to be stored at the furnace in summer to last until navigation reopened. This required a heavy outlay of capital and also prevented a furnaceman from taking advantage of sudden changes in the condition of the trade. A heavy stock of ore would compel him to run until it was smelted, even though prices ruled below cost, while, if he had decided not to lay in a stock in summer, he was unable to take advantage of a favorable turn in the market during the winter, because of the impossibility of securing ore. Freed from the necessity of carrying a large stock, a furnaceman is also able to buy ore to greater advantage from competing mine owners when trade is depressed. For these reasons, and others the iron and steel manufacturers of the Northwest take a lively interest in the development of the all-rail movement.

The United States Commissioners to the Paris Exhibition are Gen. Wm. B. Franklin and Somerville Pinkney Tuck, who have just received their credentials from the President, and are now in this city engaged in the preliminary work of preparing documents for distribution, having opened an office at 35 Wall street. They already predict a good representation of objects from America. The space allotted is about 7000 square yards. The freight charged out and return are defrayed by the Government, from the Congressional appropriation of \$250,000 in aid of the exhibition. The commissioners are also allowed the free use of the mails. The exhibition opens May 5, and closes October 31.

It is reported that Mr. H. F. DeBelen, of Birmingham, Ala., is agitating the idea of arranging for storage of Southern furnaces as the basis of issues of warrants. The scheme has been laid before capitalists, but that feature of it which aims at making the yards adjoining furnaces themselves the storage point does not appear to meet with approval.

CORRESPONDENCE.

Terms of Payment on Pig Iron.

Since the publication of our last issue we have received a number of letters on this subject, some of which we give below. We repeat the questions which called them out:

1. Does four months' time on pig iron mean from date of shipment or date of receipt of the iron?
2. If cash discount is taken, is it taken from the date of the furnace shipment or from the date of the receipt of the metal?

CINCINNATI, July 10, 1888.

To the Editor: In reply to your circular letter of July 5, our understanding is that four months' time is from date of receipt, if iron is sold, as is usual, f.o.b. cars at the city of the purchaser; or, if, as is sometimes done, the iron is sold f.o.b. furnace, it refers to date of shipment. The former, however, is the general practice. If cash discount is taken it is taken from date of receipt of the metal.

THOS. A. MACK.

LOUISVILLE, KY., July 10, 1888.

To the Editor: The time for dating a note on a four months' contract for pig iron depends upon the conditions of the sale. If the iron is purchased on cars at the furnace, then the notes should be dated from the date of shipment. On the other hand, if the purchase is made delivered at some distant point, the note should be dated from the time of the arrival of the iron. Custom, however, has fixed it differently—that is, settlements are usually made on the first of the month following the delivery. The conditions of a cash discount are in main covered by the above. It should be taken from date of the furnace shipment if purchase is made at the furnace, or, if made for delivery at another place, then it should be taken from the time the iron arrives at point of destination. Yours truly,

HALL BROS. & CO.

LOUISVILLE, KY., July 9, 1888.

To the Editor: There is no custom in this market that regulates the time from which four months' paper for pig iron is dated. As far as possible the seller endeavors to obtain his paper from the date of shipment, but as the buyer generally makes the paper it is oftener dated from time of receipt (or even a short time after that) than it is from the time of shipment, and sellers generally accept notes as received, unless the time taken is too long to be admissible. If parties pay cash instead of giving notes, where they have privilege of four months, they generally take discount for four months and remit up to the time they would otherwise give their notes, unless these cash settlements are unusually delayed, in which case the deduction is generally made for the unexpired time. The trade suffers from these irregularities which creep in during times of great anxiety to sell and producers submit to concessions asked for by buyers. In seasons of scarcity the lines are drawn more closely. Some general conference among furnaces and a settlement of these questions would be of great advantage to them, and greatly facilitate business. Another abuse that has crept into the Western market, and which should be corrected without delay is the custom of giving 2268 pounds for a ton. This originated many years ago—in fact, years before the war, and grew out of the fact that pig iron molded in sand carried about this weight of sand as compared with foreign iron which reached here, and iron molded in iron molds, which was without the sand. We are glad to see the matter taken up and hope it will be agitated until these irregularities are settled. Yours truly,

G. H. HULL & CO.

Porcelain-Lined Iron Pipe.

HAMMONTON, N. J.

To the Editor: Can any of your readers inform me who manufactures porcelain-lined iron pipe 1½ to 3 inch? S. E. B.

Nickeline.

WASHINGTON, July 14.

To the Editor: Please inform me who makes a metal known as "Nickeline," silvery, in rods, sheets and wire. J. B. K.

Washington News.

(From Our Regular Correspondent.)

WASHINGTON, D. C., July 17, 1888.

The tariff debate in the House is in its closing stages. The free wool provisions over which there was so much anticipated parliamentary skirmishing went through with barely a struggle. The vote, which stood on the Wilkins motion to strike wool out of the free list, yeas 102, nays 120, is regarded as a test. Although a larger vote is anticipated on the passage of the bill in the House the trial of strength on Monday settled the status of dubious Democrats and Republicans.

The protection Democratic wing mustered under the leadership of Randall when the discussion began not less than 11; when the vote was taken on free wool, which was the most important feature of the bill, and admitted to be a safe gauge of its strength, but three responded. The Democratic opposition in the beginning was made up of Randall and Sowden, of Pennsylvania, Vance, of Connecticut, Merriman, Stahlnecker, Greenmare and Tracy, of New York, McAdoo and Piddock, of New Jersey, and Foran and Milkins, of Ohio, on Monday. Sowden, Foran and Milkins alone voted. Randall was ill and Merriman was absent from the city. Had they been present they would have swelled the list to five, which would still have been insufficient to defeat the provision. The defection was due to the careful and sagacious amendment of the bill by the Committee on Ways and Means in certain interests. This drew over the deserting members from the protection Democratic ranks into the rival camp and made the passage of the bill possible. The Republican support of free wool also failed to come up to the mark. Knut Nelson, of Minnesota, voted with his party, as did Anderson, of Kansas. Fitch, of New York, was absent. The only vote, therefore, which Chairman Mills received for his proposition from the Republicans was Anderson, of Iowa.

The final vote on the bill may now be reached at any time, and under ordinary contingencies not later than Saturday. There only remains to be discussed the administrative features, which are not likely to call forth any very earnest or protracted debate. The Senate sub-committee are hastening all in their power to have their substitute ready at the earliest moment. When the House bill reaches them they will go over its provisions as a matter of information, but will submit their substitute to the Senate as soon as completed, which will be in about two weeks. The determination of the sub-committee is to urge the passage of the substitute. The Democratic Senators show a disposition to discuss the measure. If they carry out such a programme the tariff debate in the Senate may run the subject well into September.

The Senate bill reduces the revenues by a very different method. The principal items are the repeal of the internal revenue taxes on tobacco and fruit brandies, and a portion of the duties on sugar and alcohol used in the arts, which will aggregate upward of \$60,000,000 or \$70,000,000. There will be opposition to removing the

tax on fruit brandies, as such a step, it is claimed, will open the way to evasion of the tax on spirits by claiming all spirits to be fruit brandy by the introduction of a minimum of fruit in the manufacture.

The West Point (N. Y.) Foundry Company and South Boston Iron Works made similar bids for machine finishing and assembling of six or twelve 6-inch steel breech loading guns. Their figures were, six 6-inch guns, \$20,400; time, 13 months, or 12 6-inch guns, \$40,800, in 19 months. The forgings will be finished by the Government as soon as possible. Each 6-inch gun will weigh about 10,000 pounds.

The bids for steel for the armored battleship Texas, to be built at New York, will be opened on the 22d inst. In August proposals will be wanted for materials for the armored cruiser Maine, to be built at the Brooklyn yard.

The Cost of a Ton of Pig Iron in the Sequachee Valley.*

BY WILLIAM M. BOWRON, SOUTH PITTSBURG, TENN.

An interesting calculation was made at the Chattanooga meeting of 1885 as to the cost of making a ton of pig iron in the Chattanooga and Birmingham districts. Since that time new territory has been opened, new railroads have been built and recent construction has remedied some of the leakages of former practice. The metallurgy of the ores of these districts and the capabilities of their fuels are now clearly sustained; but the old question, How much does it cost to make a ton of iron? is still unanswered, so far as popular knowledge goes. Cost-accounts are considered, in this district at least, as close secrets; and I am not prepared to betray them, for the excellent reason that I have never had access to the cost-account of any firm making iron in these districts.

Probably if I had sought such special information I could have got it, but it would not have been available for publication, and its possession would have rather been a source of embarrassment than aid in the independent investigation that I have made. Besides which there are peculiarities in the conditions of most firms that prevent them from being representative of their neighbor's practice. My first idea was to try to get in confidence such figures as might be averaged; but a very little study made me abandon this, if for no other reason than that the difference in matters that were included in cost would render such average worthless. For example, one operator builds 50 coke ovens and charges them up to "general expenditure." His neighbor, building the same number, charges them up to "capital account." The figures of cost on the same make and under similar conditions would not be identical. I now propose to give some data of cost that may assist those making their own calculations for any specific locality, premising that my figures are based on Sequachee Valley practice, as the district most familiar to me. It is but simple justice to the Tennessee Coal, Iron and Railroad Company to state that none of the figures have been derived from their work. Owing to their special facilities they work one department into another, and the figures I arrive at should not be quoted against them. I am dealing with a furnace built in Sequachee Valley to work its own local ore and coal to buy its soft ore. The materials included in Sequachee Valley are ore and coke. Hard ore is worth 75 cents per ton, and soft ore can be had for about \$2.25 per ton, delivered. A working mixture is:

Hard ore.....4,200 pounds
Soft ore.....3,500 pounds

* Read at the Birmingham meeting of the American Institute of Mining Engineers.

Allowing the hard ore to run 30 per cent. and the soft ore 50 per cent., this charge would give 3010 pounds of iron. Reducing the ore to that required for 2000 pounds of iron we have:

Hard, 2757 pounds, worth.....	\$1.034
Soft, 2325 pounds, worth.....	2.615
Add 10 per cent. for waste, moisture, &c.	.365

Ore per ton of iron..... \$4.014

The next item is coke. Analyzing its probable cost I have from different sources and composite data got the figures below.

I have made an attempt to divide up the cost of mining as follows:

	Cents.
Mining coal.....	50.0
Air course and entry.....	12.5
Incline.....	.30
Superintendence, clerks and offices.....	.25
Mules, drivers and outside labor.....	.58
Tipple.....	.25
General expenses, i. e., taxes, insurance, exhaustion of land, &c.....	.75
Timber.....	.25
Total.....	87.3

On cars at mine. Coked in 11-foot ovens, holding 4 tons of coal, 100 bushels of this coal gives 115 of coke; or 8000 pounds of coal gives 4600 coke. The cost of this may be divided thus:

	Cents.
4 tons coal per oven.....	3.492
Charging, leveling, bricking and drawing.....	.500
Loading.....	.250
Repairs.....	.050
Extra labor, switching, weighing, &c.....	.150
Total.....	4.442

Or \$1.929 per ton of coke on cars at ovens. To make a ton of pig iron with this coke takes 2748 pounds of coke, worth

Net cost.....	\$1.929
Waste and braise, 10 per cent.....	.193
Total.....	\$2.122

Or \$2.915 per ton iron, plus the freight for hauling from coal mines to furnace.

To recapitulate:	
Ore.....	\$4.014
Coke.....	2.915

Labor.

We can only arrive at labor by considering the actual production of furnaces using similar materials to those under consideration.

The following wages and labor are taken from actual practice:

	Rate of wages.	Total wages.
2 engineers.....	\$1.90	\$3.80
2 firemen.....	1.25	2.50
2 keepers.....	2.50	5.00
2 first helpers.....	1.15	2.30
2 second helpers.....	1.10	2.20
2 third helpers.....	1.00	2.00
2 stovermen.....	1.10	2.20
1 blacksmith.....	2.00	2.00
1 helper.....	1.15	1.15
1 lampman.....	1.10	1.10
5 water boys.....	.40	2.00
4 cindermen.....	1.15	4.60
1 foreman cinder yard.....	1.15	1.15
14 laborers.....	1.15	16.10
4 horses.....	1.00	4.00
1 scrap man.....	1.25	1.25
1 scales man.....	1.40	1.40
1 scales man.....	1.30	1.30
2 cage men.....	1.15	2.30
2 top fillers.....	1.20	2.40
2 top fillers.....	1.15	2.30
9 ore fillers.....	1.00	9.00
8 coke fillers.....	1.00	8.00
4 ore breakers.....	1.00	4.00
4 ash men.....	1.00	4.00
2 water boys.....	.40	.80
1 foreman.....	1.45	1.45
25 1/2 laborers on ore in stockhouse.....	1.00	25.50
Total.....		\$115.90

Switch engine and yard crew.....	20.00
Superintendence and clerks.....	20.00
Total.....	\$155.90

or an average make of 85 tons per day, or \$1.834 per ton. We have then:

Ore.....	\$4.014
Coke.....	2.915

Labor.....	1.834
Stores.....	.250
(This includes railroad iron, oil, coke-forks, sand, lumber, &c.).....	
Total.....	\$9.013

being the cost of making a ton of pig iron less the cost of bringing the fuel to the furnace, which is supposed to be located near the mine in the Sequachee Valley, and 25 cents should cover it. There only remains to add for repairs and depreciation of plant 10 per cent. on \$100,000 investment and 6 per cent. interest on the same for use of the money (for the only safe way is to regard the money invested as borrowed). These, calculated on 30,000 tons per annum, are:

Depreciation.....	\$6.25
Interest.....	.15
Brought forward.....	9.013
Total.....	\$9.413
Probable freight on coke.....	.25
Total.....	\$9.663

As this is a ton of 2000 pounds the cost of a ton of 2240 pounds will be, according to the above figures, \$10.82. The allowance for sand in the pig-iron ton does not require to be made here. Local conditions vary, but the figures above will come very near the truth in Sequachee Valley, where ore and coke are only 4 miles apart in a direct line, and can commercially be united by rail inside 20 miles. As a basis for comparison this estimate will be useful if only to check the wildly small estimates of the authors of "boom" literature and their residuary legatees, the tariff-tinkers. Unless conditions are favorable, construction suitable, and management good, these figures will be exceeded. Distance from market becomes a further factor in the question of "profit and loss," but I am simply regarding here the cost of making a ton of iron in Sequachee Valley.

The Ohio Valley Centennial Exhibition.

Among further exhibits in the machinery department at the Ohio Valley Centennial Exhibition, at Cincinnati, which lack of space prevented us from noticing in our last issue, is one by the Universal Radial Drill Company, of Cincinnati. This company show their Universal drilling machines in several sizes, the machines being adapted to a large range of work. They exhibit also their radial drilling machines, with powerful gearing to spindle, quick return, automatic feed, combined horizontal and vertical faces to table, and pivoted arm having radial movement of over three-quarters of a circle. A new tool, a brass workers' Fox lathe, is also displayed. This machine has a new principle applied in the method of feed. A number of different sizes of bench and several upright drills complete the display.

The Cincinnati Screw and Tap Company show their Universal milling machines in different sizes, machine screws, taps, dies and die-stocks.

J. K. Krugg & Co., Cincinnati, Ohio, exhibit the Heine safety boiler, made by the Heine Safety Boiler Company, of St. Louis. Two of these boilers supply steam to the exposition.

The Diebel Mfg. Company, of Philadelphia, Pa., exhibit a complete line of their Challenge grinding and polishing machinery, emery wheels, &c., through their agent, H. H. Walter, Cincinnati, Ohio.

J. H. Day & Co., Cincinnati, Ohio, display dough-mixing machinery, power flour sifters, grinders and odorless cooking pots.

The Jeffrey Mfg. Company, Columbus, Ohio, exhibit their anti-friction roller

chain belting, detachable link belting, elevators, conveyers, coal mining machines and power coal drills.

J. J. Brown & Co., agents, Cincinnati, Ohio, exhibit several styles of Red Jacket force pumps.

The Lightning Fence Machine Works, Middletown, Ohio, make an exhibition of the Lightning Fence machine and its product, and also of force and common well pumps.

The Advance Mfg. Company, Hamilton, Ohio, exhibit a line of cider presses, ice tools, &c.

The Foos Mfg. Company, Springfield, Ohio; display the Scientific grinding mills and oil cake mills in several styles and sizes, also the Scientific portable forges.

The Lagonda Mfg. Company, Springfield, Ohio, also exhibit several grinding mills, crushers and the Eclipse post-hole diggers.

E. D. Shays & Co., Cincinnati, Ohio, show an extensive assortment of heavy hardware and factory supplies, including a full line of the Ashtabula (Ohio) Tool Company's productions, consisting of forks, hoes, &c., the Buffalo Forge Company's forges, blowers; also a line of up right drills, belting, &c.

Schaffer & Buddenberg, New York City, provide a very handsome display of brass steam gauges, &c.

The Edinburgh Pulley Company, Edinburgh, Ind., have on exhibition a large line of the Self-Locking Wood Split Pulleys.

The Walker Mfg. Company, Cleveland, Ohio, exhibit a line of steel-rim pulleys, patent molded gearing, power-transmitting machinery, shafting, hangers, &c.

The Eclipse Pump Company, Cincinnati, Ohio, have an interesting display of steam and air pumps in various styles and sizes, and boiler feeders.

The Gordon Steam Pump Company, Hamilton, Ohio, display heavy double-acting pumps, suitable for water-works and wherever great capacity is required.

The Cordesman Machine Company, Cincinnati, Ohio, show a variety of wood-working machinery, including band saws, carving machines, jig saws, boring machines and a spiral twist molder.

Post & Co., Cincinnati, Ohio, provide an extensive display of the Acme Machinery Company's (Cleveland, Ohio) productions.

The Cincinnati Brass Works have a well-arranged display of their lubricators, brass castings, automatic oil feeders, &c.

The Abendroth & Root Mfg. Company, New York, exhibit the Root water-tube safety boiler and spiral tubing, both japanned and galvanized.

The Lane & Bodley Company exhibit their compound Corliss engine, furnishing power to the exposition. The cylinders are 11 1/4 x 20 x 42. The engine is rated at 140 horse-power, with 95 pounds pressure and develops 1 horse-power with 17 pounds of steam per hour.

The I. & E. Greenwald Company, Cincinnati, Ohio, have one of their automatic cut-off engines in operation. These engines are built in sizes from 60 up to 200 horse-power.

Russell & Co., Massillon, Ohio, exhibit a line of their threshers known under the title of the New Massillon, the improved Dingee-Woodbury horse-power and Pitts-Carey horse-power, portable engines from 4 to 16 horse-power, 6 to 16 horse-power traction engines, saw-mill outfits, and their well-known Russell automatic engines, adapted to a large variety of work and ranging in size from 7 x 12 to 20 x 27.

A reduction of wages of 5 to 20 per cent. has been asked of the men at the Norway Iron and Steel Works, at South Boston, Mass. The men have discussed the matter, but have not yet reached any conclusion.

WEST INDIES.

PORT OF SPAIN, TRINIDAD, June 8, 1888.—*Asphaltum*.—Our market has been steady under a good demand at \$14.04 per ton boiled and \$6.84 crude, both inclusive of export duty. Shipments since January 1 have reached 24,536 tons, as compared with only 12,302 tons last year and 11,846 in 1886. *Exchange*, 90 days' sight, \$4.74 @ \$4.80.—*E. P. Masson*.

CHILL.

VALPARAISO, June 1, 1888.—*Nitrate*.—The Anglo-Chilian Nitrate and Railway Company, Limited, have secured 9½ square miles of Nitrate lands in the province of Antofagasta, near the river Loa, about 60 miles distant from the port of Tocopilla, between Iquique and Antofagasta. The Company sent a member of the board of managers to investigate the property, a Mr. Thackthwaite, and his report is favorable. Mr. J. E. Wood, formerly Sub-Inspector of Nitrate Fields on behalf of the Chilian Government, sends an equally favorable report, and so does Don Federico J. Roman, Engineer-in-Chief of the scientific exploring expedition that was sent to investigate the Atacama Desert. The report of the latter two men is all the more valuable as they have no interest, direct or indirect, in the matter.—*Ferro-Carril*.

ASIA MINOR.

SMYRNA, June 25, 1888.—*Hardware*.—The Remscheid and Solingen Cutlery manufacturers of Rhenish-Westphalia have secured a good foothold in this part of Asiatic Turkey, so much so that the articles named have begun to supersede English, after ousting them out of the Needle and Packing-Needle trade. In Wrought Iron and Steel Belgium does the largest business in Asia Minor next to England. In Agricultural Implements and Machinery England remains prominent, in Sewing Machines Germany.—*Pera Gazette*.

EAST INDIES.

SINGAPORE, May 31, 1888.—*Tin*.—Our last report was dated 6th inst.; since then there have been small sales at \$35 down to \$34.50, and buyers now offer \$34 for ready metal, or \$32 for distant delivery, but first hands have not sold a Slab since the collapse, and will continue to hold until forced by necessity to realize. Stocks here are estimated at 600 tons, and up country the quantity in hand is said to exceed 1000 tons. *Tonnage*.—Steamer rates to London are as last quoted, with a steady market. New York via Canal, a small amount of space is offering. Via Cape, the Emily L. Boyd is full, and will sail in a day or two, and the Steinvora has taken the berth alongside the W. Anton. Rates show no change. For Boston there is no fixture. The steamer Antenor took on the 3d inst. for San Francisco, 169 piculs of Tin. *Exchange* is weak at 3¼ for six months' credits.—*Gillilan, Wood & Co.*

MANILA, July 9, 1888.—*Hemp*.—There are buyers at \$8.37½ per picul, against \$8 same time last year, equaling \$28.10, against \$27.50 per ton, cost and freight; there were cleared for the United States since last cable, 6000 bales, against none in 1887; do. since January 1, 97,000, against 123,000; loading 2000, against 6000. Cleared for England since January 1: 184,000, against 107,000 bales; loading for do., 6000, against 10,000; cleared for all other countries 42,000, against 21,000; receipts at all ports since last cable, 13,000, against 10,000; do. since January 1: 314,000 bales, against 242,000, and 203,000 in 1887 and 1886, respectively. *Freight*, \$5.50, against \$5. *Exchange*, 3/5¼, against 3/5¼.—*Ker & Co. to Charles Nordhaus, New York, per cable direct*

CALCUTTA, June 2, 1888.—*Jute*.—Crop prospects in this vicinity continue favorable. There are showers of rain almost daily, and the plant looks vigorous and healthy. The area under culture exceeds last year's by about 12%, so that consumers have prospects of a good supply, if nothing happens to thwart these expectations. As for prices the impression prevails that during the first two months of harvesting the crop prices will still rule high, but with ample receipts to date from October 1 there will be no reason why moderate prices should not rule after the first rush to buy shall have passed by. Our local spinneries will compete lively for a supply, and it will greatly depend on their action whether the ruling will be high or kept sufficiently within bounds to stimulate domestic consumption. Advices from Naraingunge re-

port that so far the crop news there received remains encouraging. Rain was general, and the plant looked well. The rivers were rising rapidly. It was hoped that there would be no necessity to commence cutting till the plant shall have reached its full height. The cutting on the low lands will probably begin by the end of this month. Receipts from Betial and Chowrah may be looked for the first week of July. The area seeded is about 7% over and above last year's. During the week large telegraphic orders were received for early canal shipments, and a big trade was done at 5/½ advance. Balers have now sold August-September deliveries sufficient in amount to pause; any further orders would provoke a fresh improvement. We quote £11.17/6 @ £12.7/6 per ton, cost, freight and insurance, per steamer, September-October shipment.—*Times of India*.

BATAVIA, June 29, 1888.—*Tin*.—The sale of 14,000 piculs Billiton, on behalf of the Government, averaged 48.84 guilders per picul.—*Per Cable via Holland*.

SPAIN.

BILBAO, June 30, 1888.—*Iron Ore*.—Certain descriptions of Ore are scarce, and to some extent there is, besides, a scarcity of miners; at the same time very little has been done in new contracts, and current business has almost arrived at a standstill, at the nominal rates of 7/6 @ 8/ for Campanil and 6/10 @ 7/3 for Rubios. Shipments hence since January 1 sum up 1,893,394 tons, against 2,255,209 last year. *Pig Iron*.—There were shipped during the week 1450 tons abroad and 80 coastwise.—*Bilbao Maritimo y Comercial*.

ITALY.

ROME, July 3, 1888.—*Iron and Steel*.—In spite of the powerful assistance which the Government lends Iron and Steel industry in Italy, what has been undertaken so far has on the whole been the reverse of successful. The most recent failure is that of the Terni Iron and Steel Works, whose labors have given a very poor result, as is shown by the report submitted to the shareholders at their late general meeting. The production of Steel was 30,952 tons, worth 10,941,731 lire or francs, and that of Foundry Pig, &c., 13,308, worth 2,483,133 lire, being about one-half of what these works furnished Italian consumption the previous twelvemonth. The company have been laboring under financial difficulties, but these have been overcome by Government aid and advances made by leading banking institutions, but the balance-sheet shows a loss so far of 2,048,687 lire. It was resolved at the meeting to cut down expenses so far as feasible and strive to improve the condition of affairs through a course of strict economy.—*Sole*.

GERMANY.

HAMBURG, July 7, 1888.—*Iron*.—The outlook in Rhenish-Westphalia has become less reassuring, mainly due to the continued stagnation in Finished Iron, intensified by the stock-taking during the last three weeks. *Pig Iron* has been flat, yet nominally sustained, there being no decline as yet in Iron Ore. Spiegel has been slightly better on more encouraging American advices, and 10% to 12% Manganese now commands 58 marks. Luxembourg Foundry Pig has been bringing 41 marks, and Forge ditto, 38.70; English Bessemer 43/ f.o.b. The rolling mills are booked for six weeks to come, no further, and the current demand for their makes amounts to very little. One of the few branches still flourishing is that of Boiler-Plate manufacture. Thin Sheets are, on the contrary, still neglected. Wire Rods suffer from the absence of an American demand, but Drawn Wire is active. Wire Nail manufacturers are in a bad fix, and their convention is on the eve of exploding. Both machine shops and foundries are still getting on tolerably well, but in nearly all other branches there is a growing complaint that prices are unremunerative because the raw material is too dear. *Metals*.—*Lead*.—Efforts continue to be made by Stolberg and other leading continental producers to constitute a general European Lead syndicate. There is some well-founded hope that they may ere long be crowned with success.—*Borsenhalle*.

Freights on Iron.—The Joint Committee of the Central Traffic Association and Trunk Lines have authorized a reduction of the iron and steel freight rates, which corresponds with the cut made by the Baltimore and Ohio between Pittsburgh and Eastern cities on June 26. The basis of the new tariff is 21 cents per hundred on carload lots, and 20 cents on cars from Chicago to New York. This makes the rates between Pittsburgh and New York 13 cents for carload lots and 16 cents for less; Pittsburgh and Philadelphia, 11 and 14, and Pittsburgh and Baltimore, 10 and 13. The Lake Shore and Michigan

Southern have issued their tariff to correspond to this reduction. Their rates between Pittsburgh and Rochester, N. Y., on bar iron, are reduced from 14 and 11 cents to 12 and 10 cents; between Pittsburgh and Syracuse and Utica, 16 and 13 to 14 and 11; Pittsburgh and Albany, 18 and 15 to 16 and 13; Pittsburgh and New York, 18 and 15 to 16 and 13.

A Long Switch Rod.

According to the *Railroad Gazette* the Lehigh Valley is putting in at Glen Onoko, Pa., a gas-pipe connection for a switch, which is 1255 feet from the point where it is operated. The device is put in under the direction of Dr. H. K. Whitner, the patentee of the Whitner uni-lever switch. The station at this place is situated on a steep grade and on a short tangent. About 500 feet below the station the line curves sharply to the left, and at this point begins a third track, between the two main tracks. The third track is used for freight trains only, and the switch at the entrance of this track has hitherto been operated by the trainmen, who, when handling heavy trains down the grade, would detach the engine some distance above and run ahead rapidly enough to give time for a man to get off and turn the switch before the cars reached it. About 700 feet above the station (1255 feet from the switch) is a single man, and the new connection is put in to enable the switch to be tended by this man. The gas-pipe for the first 700 feet from the switchman's cabin is 1½ inches. At the end of this it crosses underneath the track, the bell cranks at these two turns being placed so as to act as compensators, and the pipe of the remaining distance is 1 inch in diameter. The pipe has to pass gentle curves in the track near each end, but it is run in straight lines and V-cranks put in to change the direction. The large pipe is supported every 10 feet and the smaller every 8 feet. This is believed to be the longest switch connection in use anywhere. At night the man in the cabin knows when a train has passed the switch by the movement of the tail lights, the curve in the line beginning immediately beyond the switch. In case of fog he would have to depend upon whistle signals.

At another point on the Lehigh Valley where Dr. Whitner's levers are in use, a range light is employed to facilitate switching at long distance in the night. The switch tender who is 264 feet from the switch and over 300 feet from the point where cars in going to the side track clear the main track, has a small light fixed on a post in such a position that the movement of the cars always hides the light from him while they are foul of the switch and exposes it to view as soon as they have gone far enough to clear. It will be interesting to know whether this long switch-rod works successfully, as the expansion and contraction, even with the best known methods of compensation, always make the exact movement of a switch a matter of difficulty and uncertainty when long switch rods are used. The rod with connections, &c., may be estimated to weigh fully 1500 pounds, and this feature alone constitutes a formidable difficulty in moving the switch.

Considerable misrepresentation has grown out of the fact that a lot of steel boiler tubes was shipped lately from Boston to the Babcock & Wilcox Company, at Glasgow, Scotland, a branch of the well-known American boiler-makers. We are informed that this shipment was due to the fact that the company found it impossible to fill a specification with steel tubes such as they could obtain abroad and were forced to have them made in this country.

TRADE REPORT.

Chicago.

Office of *The Iron Age*, 95 and 97 Washington St.,
CHICAGO, July 18, 1888.

Pig Iron.—Inquiries are much more numerous than they have been, and buyers are showing greater willingness to close contracts for future requirements. Several important sales of Lake Superior Charcoal Pig Iron are reported, only one of which was made to the agricultural implement trade, the others being distributed among Malleable casting and Car-Wheel manufacturers and the general foundries. A sale of 600 tons of Lake Superior Charcoal was made for exportation to England, the particulars of which are elsewhere stated. A considerable quantity of Coke Mill Iron was sold at \$14 cash, but the purchasers are regarded as fortunate in securing a bargain, the transaction not being considered as an indication of weakness in prices. The market was thoroughly canvassed by them before closing their contracts, and they felt assured that they were getting bottom rates. Part of the Iron taken was Lake Superior and part Southern. Sellers insist that this purchase cannot now be duplicated, as Mill Iron has advanced from 25¢ to 50¢ per ton in the past few days under a revived demand from the rolling mills, which are signing the wages scale and getting ready to resume operations. Bessemer Pig Iron is again reported firmer under an improved demand, consumers finding their wants greater than they had anticipated. Quite a number of Western furnaces, which have been making Iron for the general market, have taken Bessemer contracts to the extent of their full capacity for the remainder of the year, relieving the trade in Foundry Iron to that extent. Sellers look forward quite confidently to an improved condition of affairs in a very short time. Cash quotations are as follows, f.o.b. Chicago: Lake Superior Charcoal, all numbers, \$19 @ \$19.50; Alabama Car-Wheel, Nos. 1 and 2, \$25.25; do., Nos. 3 to 6, \$26.25; Southern Charcoal Foundry, No. 1, \$18; Jackson County Softeners, No. 1, \$17.50 @ \$18; Hocking Valley, Soft Foundry, No. 1, \$16.50 @ \$17.50; American Scotch (Blackband) No. 1, \$18.50 @ \$19.50; other Ohio Scotch Irons, No. 1, \$17.50 @ \$18; Lake Superior Coke, No. 1, \$17 @ \$17.50; No. 2, \$16 @ \$16.50; No. 3, \$15 @ \$15.50; Southern Coke, No. 2, \$16.50 @ \$17; No. 2½ and Open Bright, \$16; No. 3, \$15.50; No. 1 Mill, \$15 @ \$15.50.

Bar Iron.—The evident settlement of the wages controversy in favor of a continuance of the old scale leads a number of buyers to believe that prices will not be likely to go lower. Had a concession been obtained by the manufacturers these buyers would have expected a lower range of values. They now look forward to a stoppage of production by the mills finding themselves unable to realize cost on the present prices of materials and the agreed rate of wages, and are inclined to place their orders for such Iron as they may need. A number of season contracts are in the market from large establishments, while small manufacturing consumers are buying very liberally from mills and from jobbers. The usual mill quotation for Common Iron is now 1.65¢, half extras, f.o.b. Chicago, but some are asking 1.67½¢ @ 1.70¢, while others making a limited range of sizes are willing to take quite low prices on what they can supply. Splice Bars are weak under active competition for larger orders to go South, and are probably quotable at about 1.60¢ here.

Structural Iron.—Quite a demand is experienced for Beams and other shapes for building purposes. None of the orders are very large, but a number of them range from 75 to 200 tons. Store prices are as follows: Angles, 2.40¢ @ 2.70¢; Tees, 2.60¢ @ 2.90¢; Beams and Channels, 3.80¢. Carload lots from mill are quoted as follows, f.o.b. Chicago: Angles, 2.20¢; Universal Plates, 2.25¢; Tees, 2.45¢; Beams, 3.40¢. Notwithstanding the increased number of mills making Beams, and the reported decline in consumption, deliveries are not being made promptly, and builders are greatly annoyed.

Plates, Tubes, &c.—The demand for Plates has been excellent, and very favorable reports are made of the prospects for coming business. Tubes are a little firmer, the mills reporting the receipt of all the orders they can handle at present prices. Quotations from store are as follows: Heavy Sheets, Nos. 10 to 14, 2.65¢; Tank Iron, 2.55¢; Tank Steel, 2.80¢; Shell Iron, 3¢; Shell Steel, 3.25¢; Flange Iron and Steel, 4¢; Fire-Box Steel, 4.75¢ @ 5.75¢; Boiler Rivets, 4¢ @ 4.25¢; Ulster Iron, 3.75¢; Boiler Tubes, 60 % and 10 % off on 2½-inch and larger and 62½ % off on 2-inch and smaller.

Sheet Iron.—Heavy purchasers do not seem to have secured all the stock they will need, as mill representatives are still in receipt of inquiries and are making some sales. They quote 2.95¢ for No. 27 Common, f.o.b. Chicago, in carload lots, but this price can now be shaded, as the wages trouble seems to be about settled, and there will be no shortage in the supply of sheets. Jobbers report the buying movement having begun in the smaller trade, starting up a little earlier than usual. Some sales have been booked for fall delivery. Prices from store are based on 3.10¢ @ 3.20¢, according to quantity, for No. 27.

Galvanized Iron.—The demand for mill lots continues to be very heavy, but prices are sagging, a noticeable change having occurred in the temper of trade in this respect. No quotable change has been made as yet, small lots still moving at 60 % and 5 % off for Juniata, and 60 % and 10 % off for Charcoal.

Merchant Steel.—Large buyers are beginning to make their appearance, but are slow to determine what they will do this year. Those who are out of stock are now buying in carload lots. Such orders, in connection with a fair stove trade, have made business good in the past week. Quotations from store are as follows: Bessemer Bars, 2.30¢ @ 2.50¢; Tool Steel, 8½¢ @ 9½¢; Specials, 13¢ @ 25¢; Crucible Spring, 4.40¢; Open-Hearth Spring, 2.90¢; Open-Hearth Machinery, 2.75¢ @ 3¢; Crucible Sheet Steel, 7¢ @ 11¢.

Steel Rails.—The large orders in sight are still awaiting the negotiation of securities through the usual financial agencies, and, in the meantime, the local mills are forced to be content with orders for small lots. Carload orders are not despised, but received with pleasure and filled with remarkable promptness. Prices for this class of business range from \$32 to \$32.50.

Old Rails and Wheels.—In the absence of sales Old Iron Rails are nominally quoted at \$18 @ \$18.50. Small lots of Old Car-Wheels have been sold at \$18.50.

Scrap.—Buyers are still holding off, while the supply is rapidly increasing, and prices are therefore very weak. For Mixed Country Scrap dealers are quoting \$12. Selling quotations for Carefully Selected are as follows, per ton of 2000 lb: No. 1 Forge, or Railroad Shop, \$17 @ \$18; Track, \$16.50; No. 1 Mill, \$13; Light Wrought, \$9; Horseshoes, \$16.50; Axles, \$22 @ \$23; Cast Machinery, \$12.50 @ \$13; Stove Plate, \$9; Cast Borings, \$8.25;

Wrought Turnings, \$10; Axle Turnings, \$12; Coil Steel, \$13.50; Leaf Steel, \$14.50; Locomotive Tires, \$15.

Hardware.—Heavy Hardware is moving more sluggishly, except Bar Iron and goods going with it into the hands of the manufacturing trade. The demand is quite strong from that direction. In Shelf Hardware the same irregularity exists as stated last week, some houses reporting a very heavy inflow of orders from all classes of customers, while others could dispose of a great deal more business if it would come their way. The explanation is probably to be found in the locality from which trade is drawn. The houses dealing largely with farming communities are directly affected at this time of the year by the concentration of energy upon the growing and ripening crops.

Nails.—A few large orders have been placed with the factories on private terms, but general trade in both Cut and Wire Nails has been quiet. Steel Nails are quoted by the representatives of factories at \$1.87½ @ \$1.92½, f.o.b. Chicago. Jobbers' quotations are still \$2.05 for small lots of Steel Nails, shaded according to circumstances, and \$2.50 @ \$2.60 for Wire Nails, the quantity governing the price.

Barb Wire.—No business is being done here in this branch of trade, as farmers now have no time to make or repair fencing. Nominal quotations on small lots continue at 3¢ for Painted and 3.75¢ for Galvanized.

Pig Lead.—About 400 tons were sold during the week, which opened at 3.90¢ for small lots of Desilverized, and subsequently declined to 3.80¢ @ 3.87½¢, in sympathy with the weakness in Eastern markets. On the 13th inst. the Chicago Department of Public Works opened bids for 100 tons of Pig Lead, the competitors being the Raymond Lead Company at \$3.97½ @ 100 and E. W. Blatchford at \$3.96.

Philadelphia.

Office of *The Iron Age*, 220 South Fourth St.,
PHILADELPHIA, PA., July 17, 1888.

Pig Iron.—There is no change of any importance, and in all leading features last week's report would cover the market at this time. The supply of good Irons is not more than equal to the demand, and prices for such are easily maintained. With other descriptions there is less uniformity, and it is hard to define their position. The supply is only a fair average one, but consumers show no disposition to load up with anything that is not fully up to their requirements, hence there is a good deal of effort required to make sales at prices in proportion to the general market. In fact, it is not so much a question of price as it is of quality. For the present anything that the trade regard as of satisfactory quality will sell at from \$15.50 to \$15.75, delivered, for Gray Forge; \$17 @ \$17.50 for No. 2, and \$18 @ \$18.50 for No. 1, and a trifle more for special qualities. New brands or medium qualities cannot be quoted with much exactness, as there is very little doing, and what there is is usually on private terms. There is not much urgency to sell, however, and as a rule, asking prices are not far from those already quoted, although large lots could doubtless be picked up here and there on specially favorable terms. Evidently the market is a waiting one, and one that will respond easily to any new developments, favorable or otherwise. Meanwhile neither side manifest much interest in the matter, and from present indications the market is likely enough to continue in its present groove for some time to come. The decrease in the output noticed in last week's *Iron Age* shows a falling off in production since January 1,

averaging about 1,000,000 tons per annum, which, doubtless, accounts for the moderate offerings, as well as the steadiness of the market at these very low prices. The starting up of mills in the West may also cause a firmer feeling in Pig Metal, as a portion of the recent weakness was based on the expectation of heavy offerings from the West. But in any event, there is not much danger from that source at the low prices now prevailing in Eastern markets.

Foreign Iron.—It seems hardly worth while quoting, as there is no probability of business being done, prices being much beyond what buyers can afford to pay. Bessemer is nominally \$19 @ \$20, c.i.f., duty paid, and 20 % Spiegel \$26 @ \$26.50. American Bessemer, said to be equal in quality to the foreign article, can be laid down at mills at less than \$18.

Blooms.—There is no change in prices, and only a small business doing at about last week's quotations, which are about as follows, with some concessions on large orders, say, Domestic Rail Blooms, \$28 @ \$28.50, Slabs and Billets from \$29 to \$35, f.o.b. cars at mill, according to analysis; Charcoal Blooms, \$52 @ \$54; Run-out Anthracite \$42 @ \$44; Scrap Blooms, \$34 @ \$35 per "bloom" ton of 2464 lb. Foreign at tide, c.i.f., duty paid, \$29 @ \$30 for Nail Slabs; \$31.50 @ \$32.50 for 4 x 4 Billets, and \$35 @ \$39 for Siemens-Martin, price according to analysis, &c.

Muck Bars.—There is a little more inquiry, and holders are inclined to be firm at the low quotations now ruling, and in some cases are asking a shade more money. Sales chiefly at \$27 delivered, although in some cases \$26.50 has been accepted.

Bar Iron.—There is very little doing in Bars, and prices are something easier than they have been for several weeks past. This is because of the collapse of the lock-out in Pittsburgh and to a general desire to secure orders before competition becomes as active as seems likely that it soon will be. The demand is very light, however, and it is difficult to find buyers willing to take lots of any size. Under these conditions prices are hard to quote, as so much depends on quantity, specification and requirements as to quality. For the general run of orders some mills get 1.8¢ @ 1.85¢, while others have quoted as low as 1.75¢ for 100-ton lots. All depends on circumstances, but for the time being the outlook seems to favor buyers rather than sellers. Skelp Iron is more active, and, as several good-sized lots have been taken within the past two or three days, mills will probably be a little more independent. Sales aggregate to about 1500 tons, at from 1.8¢ to 1.8½¢, delivered, with still further demand at the inside figure.

Plate and Tank Iron.—Prices are hardly as firm as they were a week or two ago, although the mills are all full for the current month. An order for 500 tons Bridge Plate was placed at less than 2¢, and unless for small orders or a specially good quality, this seems now to be an outside figure. Prospects are said to be a trifle better, but there are so many on the lookout for orders that it is almost impossible to avoid cutting, notwithstanding the unprofitableness of business at current rates, which are nominally as follows: Ordinary Plate and Tank Iron, 1.95¢ @ 2.05¢; Shell, 2.4¢ @ 2.5¢; Flange, 3.5¢; Fire-Box, 4¢; Steel Plates, Tank and Ship Plate, 2.3¢ @ 2.4¢; Shell, 2.7¢; Flange, 3¢ @ 3½¢; Fire-Box, 3½¢ @ 4½¢.

Structural Iron.—A very light demand is reported in this department, although there is still a good deal of work going on in connection with old orders. To-day the demand for small lots is better than usual, however, and as there is said to be a large amount of work to come out soon, it is possible that improvement is not very distant. Meanwhile prices

remain as before, say: 2¢ @ 2.10¢ for Bridge Plate; 2¢ @ 2.10¢ for Angles; 2.6¢ @ 2.7¢ for Tees, and 3.3¢ for Beams and Channels, Iron or Steel.

Sheet Iron.—There is not as much doing as might be expected at this season, although mills manage to run full without accumulating much stock. Prices are irregular, but for small lots of best makes quotations are about as follows:

Best Refined, Nos. 26, 27 and 28... 3½¢ @ 3¼¢
Best Refined, Nos. 18 to 25... 3¢ @ 3½¢
Common, ¼¢ less than the above.
Best Bloom Sheets, Nos. 26 to 28... 4½¢ @ 4¼¢
Best Bloom Sheets, Nos. 22 to 25... 4¢ @ 4½¢
Best Bloom Sheets, Nos. 18 to 21... 3½¢ @ 3¾¢
Blue Annealed... 2.8¢ @ 3¢
Best Bloom, Galvanized, discount... 62½¢
Common, discount... 67½¢

Merchant Steel.—The general conditions of the market remain unchanged. Small lots of Tool Steel are selling more freely, and inquiries from large buyers indicate a heavier demand in the near future. Lots from store are quoted as follows: Tool Steel, 8½¢; Machinery, 2½¢ @ 3¢; Crucible Spring 4½¢; Open-Hearth Ordinary Spring, 2½¢; Crucible Machinery, 5¢; Best Sheet Steel, 10¢; Ordinary do., 8¢.

Steel Rails.—There is not much business to report in this vicinity, and prices are still nominally \$30 at mill. It is pretty well understood, however, that orders have been accepted at a lower figure, and on firm offers from desirable parties would be accepted again, but buyers of that character do not appear to be very numerous at this time. In the absence of definite information of sales at lower figures, we quote \$30 at mill, nominal.

Old Rails.—Stocks here are so light, and are held in such a way, that there is practically no market at present. Sales at outside points, however, have been made at from \$21.50 to \$22, delivered at mills, with bids at about \$21, for Philadelphia deliveries.

Scrap Iron.—There is no change in this department, the demand being very slow, and prices without material changes. Sales chiefly at the range of prices as follows, say: \$19 @ \$20 for cargo lots; \$20 @ \$21 for carload lots, delivered, or for choice \$21.50 @ \$22; No. 2 do., \$14 @ \$15; Turnings, \$13 @ \$14; Old Steel Rails, \$19 @ \$20; Cast Scrap, \$14 @ \$15; do. Borings, \$9 @ \$10; Old Fish Plates, \$24 @ \$25. Old Car-Wheels, \$17 @ \$18, Philadelphia, or its equivalent.

Wrought-Iron Pipe.—Manufacturers report an increased demand, and quote prices with considerable firmness, while those in a position to make early deliveries are advancing prices accordingly. Discounts are quoted as follows: Black Butt-Welded, 55 %; on Galvanized do., 45 %; on Black Lap-Welded, 65 %; on Galvanized do., 52½ %; on Boiler Tubes 60 %.

Nails.—Not much doing. Small lots are sold for local delivery, but outside of this things are very quiet. Price is quoted at \$2.05 @ \$2.10 from store, with the usual discount on large quantities. The new "pool" to restrict production, as proposed by Western mills, fails to meet with much encouragement among Eastern manufacturers.

Chattanooga.

Office of *The Iron Age*, Carter and 9th Sts.,
CHATTANOOGA, July 16, 1888.

As is usual through the South, mid-summer has brought a falling-off in general business. Collections are slow and money is hard to get. The banks are very conservative. There is a great pressure upon them in consequence of many holders of real estate notes being obliged to realize. Many purchasers of real estate are yet behind in their payments, which

must result in the end in some sacrifices and depreciation of values. Another thing that acts as a disturbing element in business is the agitation of the tariff and the uncertainty that exists in regard to the effect that the lowering of the duties will have upon the business of the country.

Pig Iron.—During the past week there has evidently been a better feeling in reference to good grades of Foundry Irons. At the present time there is not a surplus of such Irons in the South, and some stacks are much behind in filling their orders for these grades. It would not take a long continuation of these conditions to cause a perceptible advance in prices, for as matters now stand some of the furnaces are not in a condition to accept more orders, and in any event are disinclined to book orders for over 30 to 60 days ahead. There is a drug in the lower grades, but somehow there is no accumulation of any consequence in stocks, and nearly all the yards are showing a very clean appearance. To undertake to quote prices at the present time would be impossible, as where the sales amount to round lots they are generally on private terms. Quite recently the furnaces have found some difficulty in getting cars to make their shipments as fast as desired. Freights have undergone no change, being on a basis of \$2.25 to Louisville and Cincinnati and \$3 to St. Louis.

Cleveland.

CLEVELAND, July 16, 1888.

Iron Ore.—The total shipments from upper lake ports to date aggregate 1,352,000 tons, against 1,540,000 tons up to a corresponding period last season. These figures do not, however, furnish a proper basis for comparisons, inasmuch as the season of 1888 was fully two weeks later in opening than that of 1887. While there are no reports this week of very large blocks of Ore having been sold, the market has been active, and the aggregate amount disposed of is quite satisfactory. Menominee and Gogebic non-Bessemer have sold with such freedom at \$3.50 that the season's output of many mines has been disposed of. Ore from the Champion and Republic mines, and, in fact, all first-class standard Ores, are still held at \$6 per ton—the price established at the opening of the market in May. Many of the local dealers report that a limit has been reached in the sales of Ore from the mines they represent. Vermillion Bessemer have probably been fully engaged, and it is doubtful if much more Gogebic Bessemer will be offered. Estimates regarding the amount of Ore already sold vary from 3,000,000 to 3,500,000 tons, with the probabilities favoring the lower figures. Vessel rates are firmly established at 85¢ from Escanaba, \$1.10 from Marquette, and \$1.15 from Ashland—a considerable reduction from \$1.50, \$1.75 and \$2.10 rate talked of by vesselmen early in the year. The up cargoes of Coal are very heavy, and ship-owners are not losing any money. Quotations are unchanged at \$5.75 @ \$6 for No. 1 Specular and Magnetic Bessemer; \$4.50 @ \$5 for Bessemer Hematites; \$3.50 @ \$3.75 for non-Bessemer Hematites; \$4.75 @ \$5 for Menominee Bessemer; \$3.50 @ \$4 for Menominee non-Bessemer; \$4.50 @ \$5 for Gogebic Bessemer, and \$3.50 @ \$3.80 for Gogebic non-Bessemer.

Pig Iron.—The market steadily improves. A very satisfactory business in the way of sales has been done during the week. Buyers are purchasing Iron for future wants with a freedom indicative of a termination to the long period of absolute idleness. Bessemer Pig is still the strongest Iron in the local market, bringing from \$1 to \$1.25 more per ton than

was demanded in June. Probably 15,000 tons of Mill Iron have been sold during the week; while Foundry Iron has been inquired for with even greater freedom. Dealers look forward to a settlement regarding prices within the next week, when other than nominal quotations can be given.

Old Rails.—The market is lifeless, no sales of any importance being reported. Old Car-Wheels bring about \$19.50. Axles are in some demand.

Coke.—The price at the ovens is still \$1 7/8 ton, with concessions to large purchasers.

Pittsburgh.

Office of *The Iron Age*, 77 Fourth Ave., }
PITTSBURGH, July, 17, 1888. }

The general industrial situation, so far as this district is concerned, continues in an unsatisfactory condition, and the outlook for an immediate improvement is not favorable. It is stated that there is a good deal of dissatisfaction on the part of the members in regard to the present standing of the Western Iron Association. It is claimed that some of them have acted in bad faith, having accepted the scale of the Amalgamated Association after having agreed with their brethren to resist. It was expected that some of them would sign, being in such a position that they could not very well help themselves, but others, it is claimed, acted in bad faith. Some of the members now threaten to withdraw from the association, while others want to have it reorganized. A forfeit is advocated of say \$10,000 to \$20,000 by each firm belonging to the association.

The great event of the past week was a coal-boat freshet, and the shipment of some 12,000,000 bushels of coal to down-river points, mostly for Cincinnati and Louisville, although a few tows go through to New Orleans. This is one of the largest coal "runs" ever made in July, and was a successful one.

Pig Iron.—There has been no important change in the situation since our last report, but as a number of firms have signed the scale and are expected to start up their mills an increased trade is looked for soon, as consumers, almost without exception, are known to be low in stock, and nearly all of them will have to buy before starting up. However, at present, as but comparatively few of the mills are running, there is not much Pig wanted, and brokers, almost without exception, report trade as being exceedingly dull, but they are hopeful of a change soon for the better, and, as already intimated, their expectations will no doubt soon be realized. The feeling pretty generally obtains that prices have touched hard pan, and furnacemen aver that the next move will be upward. It is generally agreed that there is no margin for profit at present prices, and while the market remains in its present condition there is not likely to be any increase in production. Stocks in first hands are reported light, as nearly all furnaces in blast have contracts and there is not much inducement to start up those now standing idle. Furnacemen say that not for years has the market been in a worse condition than it is at present, and they appear to be pretty confident that it cannot possibly get much worse. Prices remain about the same as a week ago, with the exception that possibly Bessemer is a shade weaker. We quote as follows:

Neutral Gray Forge.....	\$14.00 @ \$14.75, 4 mos.
All Ore Mill.....	15.25 @ 15.75, "
No. 1 Foundry.....	16.75 @ 17.00, "
No. 2 Foundry.....	15.75 @ 16.25, "
No. 3 Foundry.....	15.00 @ 15.25, "
Charcoal Foundry.....	21.00 @ 23.00, "
Cold Blast Charcoal.....	25.00 @ 28.00, "
Bessemer.....	17.25 @ 17.50, "

Muck Bar.—The demand continues light, while prices remain unchanged,

\$26 @ \$28.50, cash. There has been but very little inquiry for several weeks. There are those who would buy on speculation if the price was low enough, but sellers are not any more numerous than buyers at prices quoted.

Manufactured Iron.—Business continues light, notwithstanding the strike; buyers do not appear to be at all apprehensive of anything like a famine, hence, as a rule, they continue to buy only as their immediate wants require. No doubt there will be an increased demand a little later on, but there is nothing in the outlook to indicate any particular activity, although there is reason to believe there will be at least a fair average fall trade. Prices are without quotable change. Bars, 1.70¢ @ 1.80¢; Plates, 2.10¢ @ 2.15¢; No. 24 Sheet, 2.70¢ @ 2.80¢, all 60 days, 2 % off for cash.

Nails.—The Nail trade continues in an exceedingly unsatisfactory condition. Demand is light and prices are unsettled and unremunerative. Manufacturers are refusing to cut card rates, but the fact that they are getting little or no business demonstrates that cutting is being done elsewhere. We continue to quote upon a basis of \$1.90 for 12d to 40d, 60 days, 2 % off for cash, in carlots and upward.

Wrought-Iron Pipe.—The general condition of the market continues exceedingly unsatisfactory, and the outlook is not regarded as being very promising for an immediate improvement. Prices continue so unsettled that they cannot be quoted with any degree of accuracy; some of the mills are standing idle and those in operation are not working up to anything like their full capacity. The great trouble is the lack of oil and natural gas developments as compared with what there was a year ago, when the Pipe mills had a demand for about all the Pipe they could make. There may be an improvement before the winter season sets in, but the outlook at present is not very encouraging.

Old Rails.—The market continues very dull and prices are weaker. We are advised of a sale of 500 tons American at \$20.75. Their is little inquiry. Some of the larger consumers are entirely out of the market, their mills being stopped, and until they are started up buyers in this district are likely to continue scarce. However, the stock of Rails is small and the offerings are light, and some holders appear to be as indifferent as the buyers.

Steel Rails.—So far as we can learn there has been little new business here of late. The Edgar Thomson Works during the past week made some large shipments by river to the Mobile and Ohio Railroad—three barges, containing about 1700 tons. These works are still working up pretty well to their full capacity, turning out from 800 to 1000 tons of Rails per day of 24 hours.

Billets, &c.—There is a continued good demand for Bessemer Steel Billets; nearly all the mills are oversold and some of them are indifferent about taking more orders at present prices, which we continue to quote at \$28 @ 28.50, cash. As to size, quality and delivery, Nail Slabs are still quoted at \$27.75 @ \$28.

Merchant Steel.—There is but little change to note in this branch of trade. Orders continue light, while prices remain unchanged. Tool Steel, 8 1/4¢; Crucible Spring, 4 1/4¢; Crucible Machinery, 5¢; Open-Hearth Machinery, 2 1/4¢. Singer, Nimick & Co. have started up their works with non-union workers, and they appear to be confident of success.

Old Material.—There is a very light demand for all kinds of material, owing to so many of the mills being idle, and prices are weak, but nominally unchanged.

Railway Track Supplies.—Demand continues light, and prices weak, but nominally unchanged: Spikes, \$2 @ \$2.10, 30 days, delivered; Splice Bars, \$1.75 @ \$1.85; Track Bolts, \$2.85 with Square and \$2.95 with Hexagon Nuts.

Cincinnati.

CINCINNATI, July 16, 1888.

Pig Iron.—The improvement in the local Pig-Iron market noted a week ago has continued to grow, and, while the individual sales have not been especially large, the volume of business in the aggregate has been fair, and in some instances furnaces have been enabled to obtain a further advance on prices current two or three weeks ago. Sales have been made of both Foundry and Mill, Coke and Charcoal Irons at prices somewhat in advance of those which could have been obtained at the beginning of the month. There have been no new developments, however, to influence the prices of Iron other than those noted some few weeks since. The improved weather and continued favorable crop reports have imparted a tone of confidence throughout business circles, and Pig Iron especially has reflected this improved feeling. The strike of the Iron-workers is apparently drawing to a close, and the producers of Pig Iron regard it as a feature of special significance, denoting a fair amount of business on hand at the mills, from which they draw the inference that the demand for Pig Iron will be increased in the near future. Most of the Southern furnaces are disposed to contract for little Iron beyond 60 days' delivery, even at an advance of 25¢ to 50¢ 7/8 ton. Buyers, however, are not disposed to make large contracts at present, although they are making more urgent inquiries. The market is still retarded by the amount of off grades for sale, but there is no great pressure to sell even such brands of Iron. About 15,000 tons of No. 2 Southern Mill Iron has been sold on the basis of \$13.25 @ \$13.50 7/8 ton, cash, Cincinnati. Between 3000 and 4000 tons Lake Superior Charcoal Iron has been sold on the basis of quotations. Prices current here, cash, f.o.b., are approximately as follows:

Hot-Blast Foundry.

Southern Coke, No. 1.....	\$16.50 @ \$17.00
Southern Coke, No. 2.....	15.50 @ 16.00
Southern Coke, No. 3.....	15.00 @ 15.50
Ohio Soft Stone Coal, No. 1.....	17.00 @ 17.50
Ohio Soft Stone Coal, No. 2.....	15.00 @ 15.50
Mahoning and Shenango Valley ..	16.50 @ 17.00
Hanging Rock Charcoal, No. 1.....	20.50 @ 22.50
Hanging Rock Charcoal, No. 2.....	19.00 @ 21.00
Tennessee and Alabama Charcoal, No. 1.....	17.50 @ 18.00
Tennessee and Alabama Charcoal, No. 2.....	16.50 @ 17.50

Forge.

Strong Neutral Coke.....	13.50 @ 14.00
Mottled Neutral Coke.....	12.50 @ 13.00
No. 1. Mill Coke.....	13.75 @ 14.00
No. 2 Mill Coke.....	13.25 @ 13.50

Car-Wheel and Malleable Irons.

Southern Car-Wheel.....	20.00 @ 23.00
Hanging Rock, Cold Blast.....	22.00 @ 25.00
Lake Superior Car-Wheel and Malleable.....	20.50 @ 21.50

Manufactured Iron.—Several of the local mills have signed the scale, and a number of others at Pittsburgh have yielded to the Amalgamated Association. It appears to be but a question of time when the Iron-workers will have gained their point. The demand for Bar, Sheet and Structural Iron has not improved materially, however; yet it would seem that a number of mills have contracts which require them to continue operations during the summer, and they cannot afford to remain idle when by paying the previous scale they may continue. There are some mills, however, which are not thus bound, and they are in no hurry to yield. It is claimed that the \$1.50 rate made for Manufactured Bar Iron was only current at Youngstown, the local mills adhering to the card rate as previously quoted: Bar and Sheet Iron—Common Bar Iron, 1.90¢

@ 2¢; Charcoal Bar Iron, 2.90¢ @ 3¢; Sheet Iron, Boiled, Nos. 10 to 27, 2.50¢ @ 3.25¢; Sheet Iron, Charcoal, Nos. 15 to 25, 3.4¢ @ 4.4¢ per lb.

Nails.—There has been a fair jobbing demand, which has been steadily met at prices previously quoted, based upon 12d @ 40d, which sell at \$2 per keg, with 10¢ rebate in carload lots at mills; 50d @ 60d, 25¢; 10d, 10¢; 8d @ 9d, 25¢; 6d @ 7d, 40¢; 4d @ 5d, 60¢; 3d, \$1, and 2d \$1.50 per keg more. Steel Nails sell at \$2 and Steel Wire Nails at \$2.65 @ \$2.75 per keg.

Old Material.—An easier tone has been apparent with moderate sales of Old Rails at \$19.60 per ton, cash, here, at the close. A round lot is offered at \$19.50, with \$19.25 bid. Old Wheels have ruled weaker, with freer offerings and moderate transactions at \$18.90, spot cash.

Detroit.

WILLIAM F. JARVIS & Co., under date of July 16, report as follows: There has been no material change in the Pig Iron market here during the past week, except that a firmer feeling seems to exist among the Lake Superior Charcoal men. A number of large orders have been placed, in some cases for a year's supply, at prices that have ruled for the past three or four weeks, and from the number of inquiries received and the amount required it would seem as if the near future would show a considerable increase both in the number of sales and tonnage for this grade of metal. Ohio and Southern Irons have been quite active, although not as steady as Charcoal Iron. We quote the market to-day as follows:

Lake Superior Charcoal, all numbers.....	\$20.00 @	\$20.50
Lake Superior Coke, all ore.....	19.00 @	19.50
Lake Superior Coke, cinder mixed.....	18.00 @	18.50
Standard Ohio Black Band.....	19.00 @	19.50
Southern No. 2.....	17.75 @	18.25
Southern Gray Forge.....	15.50 @	16.00
Southern Silvery.....	17.00 @	17.50
Jackson County (Ohio) Silvery.....	18.50 @	19.00
Old Wheels.....	19.00 @	20.00

Louisville.

LOUISVILLE, KY., July 16, 1888.

Pig Iron.—There has not been a great amount of business transacted for immediate shipment, though there have been sales in lots of from 300 to 400 tons made of Bright and No. 2 Foundry for future delivery. The disposition to make purchases that will run through the year is increasing, but the prices parties are willing to pay are very low. It is thought that if a conservative policy is pursued by the new furnaces in the South who shortly will have Iron for sale the market will slightly improve, notwithstanding the offering of new Irons, as the consumption of Iron is more than equal to the production at present. It is feared that in some cases the desire to make sales will cause Iron to be offered too low. If, however, prices are not cut, there is no reason why present figures should not be realized and a slight advance take place. There is a strong demand for Foundry grades, also for Mill Irons, which the furnaces are not able to fill. Bright Irons, however, are plentiful. The rolling mills in this vicinity have signed the scale and will resume operations at once.

Southern Coke, No. 1 Foundry.....	\$16.00 @	\$17.00
" " No. 2 ".....	15.00 @	16.00
" " No. 2 1/2 ".....	14.50 @	15.00

New York.

Office of *The Iron Age*, 66 and 68 Duane street, NEW YORK, July 18, 1888.

American Pig.—Deliveries from the furnaces to the consumers continue light, and very little new business is being done by sellers from any quarter. Southern furnaces are supposed to be very well filled up so far as the older concerns are taken into account, one of the leading companies being reported to have 83,000 tons of unfilled orders on their books. Very little is heard in this section from the new plants which have gone in or are about to begin operations. Virginia furnaces appear, however, to be offering Iron in this market on the basis of \$17.50, ex-ship, for No. 1, and reports from Albany state that this class of Iron, as well as some Lehigh and Schuylkill brands, are available there on the basis of \$18 a ton, which is equivalent to \$17.50 at tide-water. We continue to quote: Standard and choice Northern Irons, tide-water delivery, \$17.50 @ \$18.50 for No. 1 Foundry, \$16.50 @ \$17.50 for No. 2 Foundry and \$14.75 @ \$16 for Gray Forge.

Scotch Pig.—We quote: Coltness, \$19.50 @ \$19.75; Summerlee, \$19.25 @ \$19.50; Langloan, \$19 @ \$19.50, and Dalmellington, \$18 @ \$18.50 for large to small lots.

Ferromanganese.—Foreign 80 % Ferromanganese is being freely offered, ex-ship, at \$49.50, with the market in buyers' favor, and the possibility of shading this price somewhat on larger blocks.

Bar Iron.—The market is weak, quotations for carload lots, half extras, on dock, being 1.55¢ @ 1.65¢ for Common Iron, 1.65¢ @ 1.7¢ for Medium, and 1.7¢ @ 1.8¢ for Refined, with special qualities selling up as high as 2¢ @ 2 1/2¢.

Plates.—We quote: Tank, 1.9¢ @ 2¢; Shell, 2.15¢ @ 2.30¢; Steel Tank, 2.4¢ @ 2.15¢; Shell, 2.15¢ @ 2.25¢; Flange, 2.6¢ @ 2.75¢, and Fire-Box, 3¢ @ 3.25¢.

Structural Iron.—We quote: Bridge Plates, 1.9¢ @ 2¢; Universal Mill Plates, 2¢, delivered; Angles, 2¢ @ 2.2¢; Tees, 2.5¢ @ 2.7¢, and Channels and Beams, 3.3¢, on dock.

Steel Rails.—The official report of the Board of Control for the 1st of July shows the sales up to date to have been 934,987 tons out of an allotment of 1,205,000 tons, the deliveries being 585,558 tons. Last year up to the same date the sales were 1,695,055 tons, while the shipments had been 907,351 tons, figures which clearly illustrate the different condition of the Rail trade this year. We may note sales during the week of about 9000 tons in a number of blocks, taken by different mills for Eastern delivery, at private terms. There are rumors of low sales both in the Eastern and Western markets. We continue to quote, however, nominally, \$30 for moderate lots at Eastern mill.

Billets.—During the past ten days there have been sales aggregating about 7000 tons of Low Carbon foreign 4-inch Basic Billets at private terms, the quotation for sailer shipment being \$28.50 @ \$29, ex-ship.

Wire Rods.—Foreign Rods are restricted entirely to the seaboard markets, the only sale of any magnitude reported during the week being one lot of 500 tons at private terms. Reports come from the West that American Billets are being sold as low as \$40 at Pittsburgh, a price which the foreign Rod cannot touch by a large sum. Abroad the market has somewhat receded, German Basic Rods selling at shipping ports at 104/. Freights, however, remain high, sailer rates being 7/6 @ 9/, which steamers command 10/

@ 12/6. We quote \$30.75 @ \$40 for forward delivery, and \$40.25 @ \$40.50 from prompt Rods.

Old Rails.—No business of any consequence is reported. For a lot of 2500 to 3000 tons in the South \$20 has been offered at Philadelphia and refused.

Scrap.—The only transaction reported is a lot of 150 tons of No. 1 Heavy Scrap at \$19, on barge.

Fastenings.—The market continues quiet, with Spikes at \$2 @ \$2.05 delivered and Angle Bars at 1.85¢ @ 1.9¢ delivered.

Metal Market.

Copper.—Since our last week's report Chili Bars have come lower from London, because hereafter contracts for future delivery will include pretty much everything in the way of Refined Copper under the new rules adopted, instead of exclusively Chili Bars, as was the case before their recent adoption. Hence, from £80. 15/- spot, a week ago, they are now cabled £79, and futures have given way from £78. 5/- to £78, but Best Selected improved during the week from £76 to £76. 10/-. Sales for the week 350 tons. Here the market has been moderately active and steady without any feature of interest, sales summing up about 1,000,000 lb, including July at 16.80¢ @ 16.85¢, August at 16.65¢, September and December at 16.35¢ and spot at 16.75¢. The *Boston Transcript* publishes revised tables showing the output of Copper mineral by the nine Lake Superior mines now producing to have been 26,537 tons in the first six months of 1888, against 24,553 tons in the same period of 1887. It points out that despite the decrease of 3014 tons in the Calumet and Hecla output by reason of the fire the aggregate output of the nine mines has increased 1984 tons. The product for the first six months figures up fully 40,850,000 lb of Refined Copper, or 3,000,000 lb increase over 1887. It is estimated, the paper referred to adds, that the product for the year 1888 will be fully 85,000,000 lb, against 70,660,000 lb in 1887 and 79,980,000 lb in 1886. Statistics of Copper in England and France were received by cable yesterday showing an increase of 4000 tons in the visible supply since the 1st inst. The process of withdrawal from English to French stores is, it would seem, still going on, evidently for the purpose of getting advances on the stock held by the syndicate. The total visible supply is now up to nearly 77,000 tons, of which about one-third is in France, against 52,000 a year ago and 62,000 in 1886. The import of American Copper into Liverpool and South Wales the first half year has been 14,322 tons Fine, against 4661 in 1887. Our cable refers to the new method of accepting other than Chili Bars as good delivery on contracts in London. The *Ironmonger* prints the following list of brands classed as "good merchantable" quality: Lake Superior, Baltimore Ingots, Wallaroo Cakes or Ingots, Burra Cakes or Ingots, Arizona Pig, with certificate attached; nothing below 96 % to be delivered. Best Select—Grenfell, Vivian, Nevill, Druce, Bibby, Lambert, C. C. C., Tharsis, Logan, Williams, Foster, Mason, Elkington, Bolton, Baxter, Landore, St. Helens, Roberts, Tough Ingots or Cakes—Grenfell, Vivian, Nevill, Druce, Lambert, Bibby, Tharsis, Williams, Foster, Mason, Elkington, Baxter, St. Helens, Bede, Grange, Rio Tinto, N. G. E. Ingots, Lota Ingots, Urmeneta Ingots. E. & Co., Hope, Lloyd, Mansfield Cakes or Ingots, Japanese Tiles, with certificate attached; nothing below 99 % to be delivered. Electrolytic Copper, with certificate attached; nothing below 98 % conductivity to be delivered. Chili Bars, G. O. B.'s, same condition as now

ruling in London, Liverpool or Swansea; usual warehouse. Each 25-ton lot to be in same port.

Tin.—At the time of our last report the London quotation for spot was £82. 15/, since when an advance to £85. 15/ has taken place, while futures improved from £88. 5/ to £86. the sales in the meantime aggregating 510 tons. The demand in this market has been limited, a moderate trade being done to supply consumption, and speculation being rather tame in spite of the London improvement. Following were the sales effected: 10 tons September, at 18.35¢ before the advance in London was cabled, and 30 tons August, September and October at 19¢ subsequently. In a jobbing way 19¢ @ 19½¢ is obtained at the close. Shipments from the Straits Settlements this way during the first fortnight in July were 150 tons, against 100 in 1887; to England 200, against 500. Since January 1 this way 100, against 2700, and in England 10,200, against 7100.

Tin Plates.—The trade in Tin Plates has not been very active, but owing to the continued light stocks prices of spot Plates have remained unchanged. In futures for August, September and October delivery business has been done during the past week at prices lower than any previously reported. At the close the market is, however, a little firmer, owing to the advance in Pig Tin. We quote at the close, large lines, on the spot, Siemens-Martin Steel, charcoal finish, \$4.75 @ \$5.25; ditto, coke finish, \$4.75; Ternes, \$4.30 @ \$4.40; Bessemer Cokes, \$4.45 @ \$4.55, and Wasters \$4.30 @ \$4.35. Coke Tins are selling at 13/ in Liverpool for prompt delivery.

Lead.—The open market has been drooping, 500 tons selling at 3.95¢, while St. Louis is flat at 3.75¢. On the Metal Exchange 648 tons changed hands from 4¢ to 4.05¢, July and August, down to 3.95¢. In London Soft Spanish was sustained at £12. 12/6, but English Pig gave way from £13. 5/ to £12. 15/.

Spelter.—Common Domestic Spelter has been dull and unsettled at 4.45¢ @ 4.47½¢, while Silesian has been looking up again in consequence of a recovery in London from £15. 15/ to £16. 17/6, and the present quotation is 5¢ @ 5½¢.

Antimony.—The recent decline in the London market to £39 for Hallett has unsettled ours, and we now quote Hallett 9½¢ @ 9½¢, and Cookson, 13¢ @ 13½¢, with a moderate trade doing.

Henry R. Merchant & Co., 2 Metal Exchange Buildings, London, have authorized Mr. Henry Gardner and Mr. Samuel Baer to sign jointly by proxy the name of their firm.

New York Metal Exchange.

The following sales are reported:

THURSDAY, JULY 12.

32 tons Lead, July.....	4.05¢
300 tons Lead, August.....	4.05¢
16 tons Lead, August.....	4.02½¢
32 tons Lead, August.....	4¢
50,000 lb Copper, July.....	16.80¢

FRIDAY, JULY 13.

75,000 lb Copper, December.....	16.35¢
16 tons Lead, July.....	3.95¢
16 tons Lead, September.....	4.02½¢
25,000 lb Copper, December.....	16.35¢
10 tons Tin, September.....	16.35¢
25,000 lb Copper, December.....	16.35¢
16 tons Lead, July.....	3.97½¢
50,000 lb Copper, August.....	16.35¢
100,000 lb Copper, July.....	16.80¢
100,000 lb Copper, July.....	16.80¢
50 tons Lead, July.....	3.95¢

MONDAY, July 16.

10 tons Tin, August.....	18.75¢
75,000 lb Copper, July.....	16.80¢
100,000 lb Copper, December.....	16.35¢
16 tons Lead, July.....	3.95¢
50,000 lb Copper, July.....	16.80¢

TUESDAY, July 17.

50,000 lb Copper, December.....	16.35¢
10 tons Tin, August.....	19.00¢
10 tons Tin, September.....	19.00¢
10 tons Tin, October.....	19.00¢

100,000 lb Copper, spot.....	16.75¢
50,000 lb Copper, December.....	16.35¢
48 tons Lead, August.....	3.95¢

Financial.

The general outlook is more cheerful. Crop prospects are further improved and the probability of a foreign demand for surplus grain is strengthened by the latest advices; added to these circumstances is the prospect of renewed activity in the iron industries. The adoption of a free-wool clause in Congress, to take effect January 1, indicates progress on the tariff question. On the Produce Exchange a feature is an advance in wheat, due to stronger cables. Exporters bought more freely. Some of the Western flour mills raised their limits. Corn was easier. The harvesting of early crops in Kansas, Illinois and Southern Michigan has been attended by favorable weather. The Kansas Farmer claims for that State the best wheat crop since 1881, estimating the yield at 22 bushels per acre; corn larger acreage than ever before. The official crop report of the State of Michigan estimates the wheat crop at 15,911,653 bushels, which is less than the crop of last year by 6,811,847, and less than one-half the crop of 1885. Cotton in South Carolina, Alabama and Mississippi, and rice and sugar cane in Louisiana, are greatly improved according to the Government report. Henry Clews attributes the favorable feeling now current in Wall street to the excellent outlook for the crops more than to any other cause that can be named. A good corn crop, Mr. Clews holds, is of vastly more importance than that of any other grain. It is well to observe, however, as a check to undue elation, that the exports of breadstuffs from Southern Russia during the coming autumn are expected to be enormous. The trunk line situation is in a less favorable shape, inasmuch as cuts have been made on new classes of freight. Provisions were cut to 18¢ from Chicago, against 22¢ @ 25¢, the regular rate being 30¢. Live hogs were also dropped to 18¢ from Chicago to New York, 16¢ to Philadelphia and 15¢ to Baltimore, against the normal rate of 30¢, 28¢ and 27¢. Dressed beef was lowered to 6¢ to New York, 4¢ to Philadelphia and 3¢ to Baltimore. The rates on lead and wool were also cut. There is no movement toward a compromise of this trouble.

The Stock Exchange markets have generally been active and strong, but toward the close showed some weakness on realizing sales. The Northwestern situation caused uneasiness. Michigan Central broke down on the announcement that the Duluth, South Shore and Atlantic Railroad has passed into the possession of the Canadian Pacific. The recent action of the Grand Trunk in announcing an advance of rates on dressed beef to 30¢ has been followed by the Nickel Plate and Lackawanna lines, whose new tariff takes effect on the 21st inst. It was also stated that the New York and New England had made arrangements with the Poughkeepsie Bridge Company, whereby it would be enabled to make connections with the Erie and Delaware and Hudson roads. Foreign houses agree in representing that there has been liberal buying of American stocks abroad since the publication of the Government crop reports, confidence having increased. On Monday there were signs of reaction.

The bank clearings of 38 cities last week were \$908,215,328, a loss of 4.5 % as compared with 1887, and outside of New York \$342,088,697, a falling off of 1.9 %. New York decreased 6.2; Philadelphia, 12.5; San Francisco, 16.5; Baltimore, 8.7; Cincinnati, 9.1; Kansas City, 5.8; St. Paul, 18.7; Cleveland, 7.9; Galveston, 22.5; and Topeka, 11.5 %. Boston increased

1; Chicago, 6.8; Pittsburgh, 13.7; New Orleans, 15.9; Detroit, 13.4; Omaha, 28.1; Indianapolis, 15.5; Memphis, 32.5; Norfolk, 27.1; and Duluth, 53.3 %.

United States bonds purchased by the Treasurer under circular of April 17, 1888, amount to \$32,648,038.90. Cost at maturity, \$42,565,933.11. Saving, 4 per cents, \$9,243,325.80; 4½ per cents, \$674,568.41; total, \$9,917,894.21. The fact that bond purchases have dwindled to an insignificant amount causes no anxiety in business, neither does it practically affect the rates of interest. The weekly bank statement showed an increase of \$3,417,600 in surplus reserve, thus recovering the losses of the last few weeks. The excess now is \$27,731,600, which indicates a very strong position compared with one year ago. Loans were contracted \$1,070,200, while specie and legal tenders heavily increased. Money is easy at unchanged rates. We quote short dates, 4 @ 4½ %, but local institutions are inclined to keep their funds well in hand. Commercial paper is in fair supply in settlement of fall purchases, but not equal to the average at this season.

The general markets are dull. Dry good jobbers notice advance engagements for autumn fully a month earlier than usual; prices steady. Anthracite Coal is advanced in price and an early advance in tolls is proposed. In the grocery trade the sensation is a corner in raw sugar by Claus Spreckles as against the trust attended by a simultaneous advance by refineries in New York and San Francisco.

The imports at New York during June, which closed the fiscal year, amounted to \$39,795,650, showing an average far above that of most former years, while the exports for the same month were only \$26,720,292, exclusive of specie, which is the smallest June total for a long period. For the 11 months ending with May the total imports into the United States were \$719,153,390, and the total exports from this country to foreign ports were \$692,119,552, leaving a balance of trade against us of \$27,033,838.

The imports of merchandise at this port last week were valued at \$8,221,000, of which \$2,500,000 represents dry goods. Since January 1 the total imports are \$258,365,000, against \$253,916,000 for the same time last year. The exports for the week were \$5,167,183.

According to the Custom-House report the exports of specie from this port last week were \$2,413,000, making a total since January 1 of \$23,452,900, against \$10,617,000 for the same time last year. The imports of specie for the week were \$16,000; total since January 1, \$5,350,000.

The Bureau of Statistics reports that the value of exports of breadstuffs for 12 months ending June 30 is \$123,298,361, against \$162,427,205 for the year ending June 30, 1887. The total exports of beef and hog products for eight months ending June 30, 1888, \$53,015,029—a decrease of about \$800,000 for the same period of 1887. The total exports of dairy products for the two months ending June 30, 1888, \$1,887,857, against \$2,030,173 for corresponding months of 1887. The exports of mineral oils for year ending June 30 were valued at \$45,150,708, against \$45,423,474 for the preceding year. Exports of cotton for ten months ending June 30, 1888, 4,469,120 bales, value \$212,398,728; for corresponding ten months of 1887 4,271,291 bales, value \$195,744,588.

Coal Market.

The Anthracite Coal trade shows more life, the recent advance having stimulated inquiry and given a stronger tone. The old schedule figures are now fully realized, unless the small steam sizes are excepted, the latter being in excessive supply. Pea

can be bought as low as \$2.40 and Buckwheat \$2 @ \$2.10 f.o.b. Quotations are as follows: Wyoming Free Burning, f.o.b. at South Amboy and Weehawken, Broken or Grate, \$3.85; Egg, \$4.15; Stove and Chestnut, \$4.50. Reading Hard White Ash is advanced 25¢ on Chestnut to \$4.40; 25¢ on Stove to \$4.50; 15¢ on Egg to \$4.25, and 10¢ on Broken to \$4.10—these prices to take effect immediately. Eastern orders are much more plentiful, and large quantities of Coal are going West.

Anthracite Coal production is increasing with the approach of the busy season. The total output for the week ending July 14 is 787,000 tons as compared with 771,000 tons for the week before, and 524,000 tons the week next preceding. Since January 1 the aggregate is 17,736,000, against 17,973,000 for the corresponding period last year. Of the output last week Wyoming contributed 444,000 tons, or nearly half the total. For the month of June, according to the official report, the production of Anthracite was 2,977,000 tons, an increase over last year of 257,000 tons. The stock of Coal at tide-water, June 30, was 741,958 tons, a decrease of 70,000 tons during the month.

Bituminous Coal is abundant at prices which the producers claim yield no profit. A fair trade is in progress.

The Pennsylvania Railroad has carried during the year nearly 6,000,000 tons of Coal, an increase of 608,000 tons compared with last year. The Reading shipped 40,000 tons of Coal to Port Richmond and Elizabethport last week. Vessels are reported in fair supply at Port Richmond, and freights are quoted at 90¢ @ \$1.05, and discharge to Boston. The freights from the Coal shipping ports in New York harbor are quoted at 70¢ @ 95¢ and discharge to Boston.

At Pittsburgh advantage has been made of the recent floods to ship down the river fully 10,000,000 bushels of Coal. Operators in the Southern trade petition the Government to require a 1000-foot span for the bridge at Memphis. Active work looking to the construction of a new railroad to connect the Philadelphia extension of the Baltimore and Ohio Railroad with the Schuylkill Coal region is in progress. The road will be 30 miles in length. The Dunn breaker, at Scranton, owned by John Jermyn & Co., was burned on Tuesday night; loss, \$100,000.

Imports.

The imports of Iron and Steel, Hardware, &c., at this port from July 6 to July 13, inclusive, and from January 1 to July 13, inclusive, were as follows:

Iron and Steel.

British Iron and Metal Markets.

[Special Cable Dispatch to The Iron Age.]

LONDON, WEDNESDAY, July 18, 1888.

The Block Tin market has been quite active again the past week, and governed almost wholly by speculative manipulation under the guidance of operators supposed to be working in the interest of producers. Consumers have a considerable supply on hand, and quite liberal amounts due on purchases of three months' contracts made some time ago. This fact and the accumulation of supplies at primary points encourage "bear" operations to some extent. The producers and their allies continue to hold supplies back to greater or less extent, however, and take the aggressive in the speculative market, presumably trusting that the "short" sellers will ultimately experience difficulty in covering their contracts without forcing prices higher. In any event it is certain that all attempts to depress prices are stubbornly resisted. Prices are now £3 @ £4 higher than a week ago.

The most interesting feature in the Copper market has been the working of the new form of contracts involving deliveries of other brands, equal to or better than Chili Bars. The previous opposition to the innovation seems to have completely died out, and the syndicate have been liberal purchasers under the new form of contracts. This, in turn, has served to improve prices, and the market shows better tone at the present time than a week ago. However, the breaking off of the late agreement between the English associated smelters and the continued transfer of large blocks of Chili Bars from England to France is not without prejudicial effect upon outside speculation.

The transactions in Copper furnace material continue to be on a small scale and at not particularly firm prices. Messrs. James Lewis & Sons' report, of 15th inst., notes a sale of 35 tons American Matte at 13/9 p unit, the first transaction in that class of material for six or eight weeks.

The demand for Tin Plate has been limited, and those buyers who manifest any disposition to take hold insist upon prices lower than have been accepted at any time since June 1. Sellers are firm, however, in view of the tone of the Block Tin market and some appearance of improvement in Pig Iron prices. The production is now on a very liberal scale, but stocks show no remarkable increase. The total at British shipping points is now 226,000 boxes, against 204,000 boxes a year ago, and about 195,000 boxes on January 1.

The Scotch Pig Iron market is affected in a degree by speculative operations governed in a good measure by outstanding engagements. The latter, together with a better demand from consumers for makers' brands, impart more or less firmness to values. Hematite warrants are held largely by merchants who purchased freely some time ago, when prices were at a very low

point. Present indications point to large consumption the balance of the year, and it is the popular idea that the requirements will be sufficient to cut the stocks down at the rate of 1000 tons per week. Producers are encouraged by the more cheerful aspect and sell reluctantly at current prices.

In several departments of the Steel trade a brisk demand is reported, and makers are, in some instances, in arrears with deliveries on back orders. However, work is not as large in some branches as could be desired, and prices consequently are somewhat uneven. Messrs. Bolckow, Vaughan & Co. have secured a large order for Steel Rails involving about 49,000 tons. The terms are not made public.

The reports from the meetings are generally to the effect that a good business was done.

Morewoods' "Lion" Galvanized-Iron Works, Birmingham, have been sold for £10,000 sterling.

Scotch Pig.—Maker's brands steadier in sympathy with "warrants," but the market quiet.

No. 1 Coitness, f.o.b. Glasgow	47 6
No. 1 Summerlee	47
No. 1 Gartsherrie	44
No. 1 Langloan	44 6
No. 1 Cambro	39 6
No. 1 Rhoda	45
No. 1 Glenarnock	43
No. 1 Dalzellington	40
No. 1 Eglinton	38 6
Steamer freights, Glasgow to New York	5/
Liverpool to New York	7/6

Cleveland Pig.—The market very firm and fairly active. No. 1 Middlesboro', G.M.B., 34/6; No. 3 do., 32/

Bessemer Pig.—Business very fair and the market steady. West Coast brands, mixed numbers, 43/, f.o.b. shipping point.

Spiegeleisen.—Prices firm and the demand good. English 20 % quoted 80/, f.o.b. N. W. England shipping point.

Steel Rails.—A good business doing at steady prices. Standard sections quoted at £3. 17/6, f.o.b. at N. W. England shipping point.

Steel Blooms.—The market quiet and unchanged. We quote at £3. 13/6 for 7 x 7, f.o.b. at N. W. England shipping point.

Steel Billets.—The market steady, with very good demand. Bessemer, 2½ x 2½ inch, £3. 17/6, f.o.b. at N. W. England shipping point.

Steel Slabs.—Values are easier and the demand slow. Bessemer, £3. 18/6, f.o.b. at N. W. England shipping point.

Steel Wire Rods.—Market still weak and dull. Mild Steel No. 6 quoted at £5. 10/ and No. 5 at £5. 7/6, f.o.b. at N. W. England shipping point.

Old Rails.—Demand light and prices barely steady. Tees quoted at £2. 15/, and Double Heads £2. 17/6, c.i.f., New York.

Scrap Iron.—Market dull and rather weak. Heavy Wrought quoted at £2. 5/ @ £2. 7/6, f.o.b.

Crop Ends.—Market dull and unchanged. Bessemer quoted £2. 5/ @ £2. 7/6, f.o.b.

Tin Plate.—Prompt deliveries firmer, with slight advance paid for Bessemer Cokes. We quote, f.o.b. Liverpool:

IC Charcoal, Allaway grade	14/6 @ 15/
IC Bessemer steel, Coke finish	13/ @ 13/3
IC Siemens	13/3 @ 13/6
IC Coke, B. V. grade	12/9 @ 13/
Charcoal Terne, Dean grade	12/6 @ 12/9

Manufactured Iron.—There has been more business, and the market is firmer. We quote, f.o.b. Liverpool:

Staff, Ord. Marked Bars	£ s. d. 7 10 0
Common	4 17 6 @ 5 0 0
Bl'k Sheet, singles	6 12 6 @ 6 15 0
Welsh Bars (f.o.b. Wales)	4 12 6 @ 4 15 0

Tin.—There has been a lively business, and the market is very firm. Straits quoted at £85. 12/6 @ £85. 15/, spot, and £86 @ £86. 5/ for three months' futures.

Copper.—Trading has been larger at rather lower prices for prompt deliveries. Chili Bars closed at £79 @ £79. 5/, spot, and £78 @ £78. 6/, three months' futures. Best Selected, £75, nominal.

Lead.—The market easier, with only a moderate business. Soft Spanish, £12. 10/ @ £12. 15/ at the close.

Spelter.—Demand has continued good and prices have further advanced. Silesian, ordinary, £16. 5/ @ £16. 10/ at the close.

Mayor Hewitt has issued a card to the public in which he called attention to the case of O. M. Hartt, the foreman of a shoe factory, who had discharged a man for theft and whom the Shoemakers' Union demand should be taken back. The Mayor says: "For 18 months Hartt has been kept out of employment, and in the meantime has been compelled to assert the doctrine of the liberty of the citizen under circumstances peculiarly discouraging. At length the law is settled, but Hartt in fighting your battles is out of pocket, as he informs me, to the amount of \$2500. For this loss he can get no redress, and the men who have caused it have been discharged by the court from punishment, while their victim, with a family of seven children, has been reduced to poverty. I have been familiar with the circumstances from the beginning and am convinced that a wrong has been done which can only be righted by the spontaneous action of the public. I would prefer that the contributions be small in amount, but general. I fear, however, at this season of the year that it will be difficult to raise the sum proposed, and hence I will head the subscription with the sum of \$100. Subscriptions will be received and acknowledged by Abram S. Hewitt."

Petitions numerously signed have been presented in the Senate from the St. Paul Chamber of Commerce, and from cannery and packers of Baltimore, Cleveland and Portland, Ore., praying for the repayment in full of duties paid on imported tin plates when made into cans and exported, containing American products.

Work has been resumed at the Belvidere mines, in New Jersey, after a suspension of several weeks. A large force of men are engaged in sinking new shafts. The outlook for steady work is encouraging. The company has a large quantity of iron ore on hand.

We have received a number of samples of the different alloys of metals produced by E. W. L. Biermann, of Hanover, Germany.

The product of the Tamarack Copper Mine for the year ending June 30, 1888, is estimated at 10,390,000 pounds. At a net profit of 6 cents per pound this would yield \$623,400.

Frank Wilkeson, a peripatetic correspondent, has sent to the New York Times a most wonderful review of the history of the American iron trade and of the present cost of mining ore, making pig iron and

manufacturing rails in the United States. We need only state that he places the cost of Lake Superior Bessemer ore at \$2.50 at Lake Erie ports, and with Connellsville coke at \$1.75 at furnaces, then gets Bessemer pig at \$7.88 in Ohio. According to our authority "good pig iron loses about 10 per cent. in weight in being transformed into Bessemer steel;" hence by some mysterious figuring the material to make steel ingots in Ohio costs \$6.59, making the total cost, with labor at \$2.50 and other expenses at \$1.95, as low as \$10.04. The conclusion is that steel rails can be made on Lake Erie for less than \$25. Let the Hon. William Scott, of Erie, retire as an expert.

The President has approved the acts for the construction of bridges as follows: A railroad bridge across the Ouachita River, Ark.; a railroad bridge across the Columbia River, between Oregon and Washington Territory; a railroad bridge across the Red River of the North; bridge across the Mississippi River, near Oquawka, Ill.; bridge over the Tennessee River, between Bridgeport and Sheffield, Ala.; bridge over the Caney Fork River, between Rock Island and Carthage, Tenn.; bridge across the Mississippi River, near Clinton, Iowa; bridge across the Tombigbee River, in Alabama; bridge across the Mississippi River, near Muscatine, Iowa; railroad bridge across Bayou d'Arbonne, La.; bridge over the Missouri River, near Nebraska City, Neb.

The new gas well near Canonsburg, Washington County, Pa., is reported to be the largest in the world, if judged by the registered pressure. Solid masonry, 12 feet thick, was put in around the top of the well to hold the cap on. The tools and rope thrown out were, perhaps, the heaviest of any yet moved in that way. The iron in the tools weighed 3000 pounds, the wet rope, nearly 2000 feet long, weighed as much more, but all was thrown up like a rocket, the rope coiling around the ruin of the derrick like so much yarn.

The Government of New Zealand has proposed a new tariff bill which will considerably diminish the free list and increase small ad valorem duties. The class of goods affected principally are such as can be exported from the United States, and includes machinery, cotton and woolen goods, boilers, ironware and manufactured carriages and wagons.

The *Railway Age* prints the following: The aggregate of track laid during the past six months now proves to be actually greater than has ever been reported in the same period with the exception of last year, when our record for the first half showed 3754 miles laid, the total for the year reaching almost 13,000 miles. Our detailed record shows that between January 1 and July 1 of the present year 3320 miles of main line—not including sidings—was laid in the United States. This mileage is divided among 168 lines, and indicates what is to be a characteristic of railway construction this year—that it will be made up by the building of a great number of comparatively short roads, instead of being composed to a large degree of long lines built by a few companies.

The United States cruiser Charleston, which is being constructed at the Union Iron Works, at San Francisco, will be launched July 19.

The Customs Department of Canada in June rendered a decision placing bronze wire on the free list, while it made the rate of duty on wire window screens 35 per cent.

Hardware.

During the past week the market has been quiet and dull, the demand being small and prices continuing in most lines without important change. Manufacturers and merchants are pursuing a conservative course and avoiding overstocking. While the market is thus not as strong and active as might be desired, the eminently satisfactory condition of things throughout the country at large is to be borne in mind, with the prospect of at least a fair fall trade.

Barb Wire.

Prices in this market are nominally unchanged, but with the limited demand and the condition of the business in the West manufacturers would probably be disposed in some cases to shade quotations if necessary to meet the views of their customers. Regular quotations are as follows: Carload lots, 4 cents; 3-ton lots, 4.15 cents, and small lots, 4.30 cents.

The Braddock Wire Company, Rankin, Pa., St. Louis office 821 South Twenty-first street, announce that in the suit of the Washburn & Moen Mfg. Company and I. L. Ellwood against them the complainants withdrew, July 2, their motion for injunction. Referring to this matter the Braddock Wire Company and the St. Louis Wire Mill Company advise us as follows:

The Washburn & Moen Mfg. Company and I. L. Ellwood & Co. have about ten suits for infringements of Barb-Wire patents pending against the St. Louis Wire Mill Company and the Braddock Wire Company, and most of these suits are in the Eighth Judicial District, of which Judge Brewer, of Leavenworth, Kan., is circuit judge. He is the only United States judge who sustained the Glidden patent. The St. Louis Wire Mill Company are ready and willing to stipulate to go to trial before this identical judge, who formerly sustained the original Glidden patent, on 90 days' notice. We think if they have any patents which they think are valid they would certainly prefer to take their chances before the only judge who ever sustained them, and we therefore make this proposition, which will be good if accepted within 30 days.

Cut Nails.

Buying continues only from hand to mouth, and chiefly in small lots. There is still some irregularity, which, however, it is stated affects only those brands which are not recognized as standard. We continue to quote \$1.90 to \$1.95 for carload lots on dock and \$1.95 to \$2.00 for small lots from store. The feeling in the trade here is that the chances of securing anything like general adhesion to a Nail pool among Eastern manufacturers are very slight indeed.

Miscellaneous Prices.

The recent action of the manufacturers of Carriage Bolts in reducing their prices is generally regarded as having been a wise move in its bearing toward the discouragement of outside competition, and also in keeping the goods at a comparatively low price, yielding a fair but not exorbitant profit. In this respect they have avoided the mistake into which similar organizations of manufacturers frequently fall. At the same time the material reduction in price and the narrowing of the margin for the jobbing trade have been regarded by them with some disfavor, and some of the wholesale houses, especially those who had recently purchased additional Bolts, so as to get the quantity discount, are disposed to complain of the hardship of the situation, particularly in view of the fact that their margin of profit on the goods is here-

after to be narrower than it was. This latter feature of the case is, however, referred to by the manufacturers as necessitated by the fact that the jobbers throughout the country were in most cases underselling the manufacturers, giving away a portion of their rebates.

The market for Augers and Bits is in a very good condition and is characterized by more regularity than usually prevails in this line. Extreme prices have been withdrawn and the goods are held at somewhat higher figures, the market continuing steady and firm. The fact that the business of William A. Ives & Co. is being carried on conservatively by Mr. Ives' executors has its bearing on the tone of the market.

The manufacturers of Cast Butts have been conferring with reference to prices and considering the feasibility of reaching an understanding which will secure regularity in this line of goods. We are not advised that anything definite has been accomplished in this direction.

The Clark Mfg. Company, Buffalo, have announced the following revised discounts for Clark's Surface Blind Hinges and Gate Hinges and Latches:

	Per cent. discount.
Blind Hinges.....	75, 10 and 5
Gate Hinges and Latches.....	60, 10 and 5

They state that they can furnish either "Old Pattern" or the "Tip Pattern" Blind Hinge. The following price list is appended:

	Per doz. sets.
Nos. 1, 40 and 50.....	\$3.50
Nos. 3 and 45.....	6.25
No. 5.....	12.50

The manufacturers of Nuts are announcing the new price of 5½ cents off list, which went into effect July 1.

With the recent changes which have taken place in Oakum, we revise our quotations as follows:

Government.....	per pound, 8 cents
U. S. Navy.....	per pound, 7 cents
Navy.....	per pound, 6 to 6¼ cents

The general features of the market on Wrought-Iron Pipe continue as at our last report. Manufacturers are holding to the advanced quotations, and the market is characterized by firmness with a fair demand.

Since our last report there has been an advance of ¼ cent in the price of Sisal Rope, making an advance of ½ cent within a short time. The stock of Sisal Hemp is reported to be exceptionally low with no prospect of any great increase in the supply until the new crop comes in. For this reason the market is regarded as exceptionally firm.

Tinware is selling at somewhat irregular prices, and dealers who have not recently received revised quotations from manufacturers will do well to look into the market carefully. There has not been a material change in price, but the tendency is toward somewhat lower figures than those which prevailed some time ago. Net prices are frequently made lower than those generally given by a discount from the list.

Goulds & Austin, Chicago, Ill., issue a postal calling attention to the Imperial Hose Reel, which they offer at 60 cents. They also quote Competition Hose, ¼ inch, at 4½ cents per foot.

The market for Tacks is in a decidedly unsatisfactory condition for the manufacturers, competition continuing very active, and exceedingly low prices being in some cases made. At some of the quotations which are current it is a question whether the manufacturers can supply the goods without materially scrimping the weight, and it will be well for the trade to look into the weights of any Tacks they pur-

chase. The frequency with which short weights are supplied is one of the features of the Tack market which must be borne in mind by the careful buyer.

The E. C. Meacham Arms Company, St. Louis, Mo., are making the following quotations on 10 M assorted lots of the goods named:

Cartridges, 45-70, 500-Grain Bullet, Copper Shells, U. S. Gov't make, outside Winchester Primer, per M., at.....	\$22.00
The New Winchester 45-70 Model, 1888, will take the U. S. Cartridge 45-70, 500-grain Bullet, and do better work than with any other Cartridge.	
Cartridges, 50-70, Brass Shells, Winchester make, per M., at.....	\$20.00

Firearms.

Hartley & Graham, 17 and 19 Maiden Lane, New York, have issued, July, 1888, a price list of Guns, Revolvers, Ammunition and Sporting Goods, with quotations to the trade. It is a well printed and well arranged pamphlet of 44 pages, in which many leading Arms are illustrated, with list prices and discounts or net figures. The list of Ammunition is also given, without quotations, however, and with an intimation that discounts will be furnished on application. Some specialties in the same line are also shown. As representing a very complete line of these goods, and giving some interesting quotations, the price list will be appreciated by the trade.

The E. C. Meacham Arms Company, St. Louis, Mo., have sent out very widely to the trade the following quotations on Firearms, in which it will be observed that some specially low prices are quoted. It is stated that only the quantities named will be furnished at these prices:

25 Remington Floberts, P. Grip, Light 22, No. 2, at.....	\$2.30
25 Remington Floberts, P. Grip, Heavy 22, No. 3, at.....	2.75
25 Warrant Floberts, P. Grip, Light 22, No. 4, at.....	2.65
25 Warrant Floberts, P. Grip, Heavy 22, No. 5, at.....	3.50

Case Lots, B. L. Single Guns.

Semi-Hammerless, 12-gauge, \$8.50; 10-gauge, at.....	\$10.50
XL Shot Guns, 38, at 85; 44 at.....	6.00
Remington System, 20-Gauge, 30 inch, at.....	5.50
Case Lots, Zulu, 12-Gauge, at \$2.65; 100 lots at.....	2.50
Springfield, 16-Gauge, 32-inch, at.....	4.50
Champion, Side Snap, 12-Gauge, at \$6.50; Twist, 12-Gauge, at.....	7.25
Champion, Top Snap, 12-Gauge, at \$7.50; Twist, 12-Gauge, at.....	8.25
Champion, Side Snap, 10-Gauge, at \$5; Twist, 10 Gauge, at.....	5.50
Champion, Top Snap, 10-Gauge, at \$6; Twist, 10-Gauge, at.....	6.50
H. Richards, Top Snap, 10-Gauge, at.....	7.00
Forehand & Wadsworth System, 10-Gauge, \$7.50; 12-Gauge at.....	7.00
Champion, Hammerless, P. G. P. F., Rubber Butt, 12-Gauge, at.....	6.50
Champion, Hammerless, P. G. P. F., Rubber Butt, 10-Gauge, at.....	6.50

25 Lots B. L. Double Guns (Assorted).

No. P., Lefauchaux, 12-Bore, at \$5.95; 10-Bore at.....	\$5.90
Bonehill, No. 28 E, 30 to 32, Choked, at.....	17.00
Bonehill, No. 36 E, 30 to 32, Choked, 10-Bore only, at.....	18.00
1023, English, Side Snap, Back-Action, 10 and 12-Gauge, at.....	8.75
1180, Same Reb. P. G., 12-Gauge only, at.....	9.50
English Side Snap Bar, 10 and 12-Gauge, at.....	10.75
English Top Snap, Bar-Action, Reb. P. G., 10-Gauge, at.....	11.50
English, Top Snap, Bar-Action, Reb. P. G., Ex. Rib., 10-Gauge only, at.....	13.50
International Top Snap, Back-Action, \$14.85; Bar-Action at.....	18.85
International Side Snap, Laminated, Pistol-Grip Rebounding, at.....	9.85

100 Ass't Dbl. Act'n Plated Revolvers.

Net Cash.	
44 C. F. British Bull Dog, Wood, American make, at.....	\$1.25
32, 38 and 44 American Bull Dog, at.....	1.50
32, 38 and 44 Imported British Bull Dog, at.....	1.40
32 and 38 XL Bull Dog, Regular Hammer, at.....	1.60
32 and 38 XL Bull Dog, Folding Hammer, at.....	2.20

41 Remington Double Derringers, at.....	4.05
32, 38 and 44 F. & W. British Bull Dog, Rubber and Reb'dg, at.....	1.70
32 and 38 Forehand & W. Automatic, at.....	5.50
38 American Arms Co., Single Action Shell-Ejecting, at.....	3.00
38 American Arms Co., Double Action, Shell-Ejecting, at.....	4.00

Straight Grip New Guns.

5 Parker Bros.' 10-Bore, 32-inch, 10 to 10½ lbs. List, at \$55; Net, at.....	\$27.50
5 Colt's 30 and 32-inch, 12-Bore, 7¾ to 10 lbs., 10-Bore, 8 to 10½ lbs. List, at \$50; Net, at.....	27.50

Case Lots Single M. L. Guns.

No. 3, Davis System, 32 to 34-inch, at.....	\$2.75
Model '42 Muskets, at.....	1.50
Model '58 Cut-Down Blued, at.....	1.75
Model '82 Blued, at.....	2.00

Will Sell in Case Lots as follows:

10 Spencer Repeating Shot Guns, at.....	\$25.00
20 Springfield Rifles, 45-70, Wind-Gauge Sights, at.....	9.00
20 Springfield Military Rifles, 50-70, with Bayonet, at.....	5.50
20 Sharps Borchardt Military, 45-70, Re-finished as new, at.....	6.50
20 Springfield Rifles, 45-70, with Bayonet, at.....	6.00
20 Whitney-Kennedy Rifles, Octagon, 40-60 and 45-60, at.....	8.75
10 Sharps Sporting Rifles, '74 Model, 45-70, 30 in Oct., D. T., at.....	9.00
50 Flobert Rifles, Extractor on Barrel, B. Cap, at.....	1.50

Items.

A meeting of the National Association of Carriage and Wagon Axle Manufacturers was held in the Monongahela House, Pittsburgh, on Wednesday, the 11th inst., President B. L. Sheldon presiding. The reports of some committees were read, and careful attention was given to reports as to the general condition of the trade and other matters of interest to the association. The following officers for the ensuing year were chosen: President, B. L. Sheldon; first vice-president, F. W. Wooster, of Brooklyn; second vice-president, G. H. Laughlin, of Cleveland; third vice-president, N. G. Park; treasurer, G. F. Smith, of Fort Plain, N. Y.; secretary, J. C. Lee, of New York.

A wholesale department has been opened at Nos. 11 & 13 South Canal st., Chicago, by the American Well Works, of Aurora, Ill. A stock of their own goods will be carried, and in addition a full line of Iron Pipe, long Couplings, plugged and reamed Pipe for Tube Wells, Artesian Tubing and well supplies generally.

The Grand Rapids Refrigerator Company, of Grand Rapids, Mich., have issued a circular in which, among other things, they call the attention of the trade to the fact that owing to the great number of houses in which steam heat is being placed there is a much greater demand for Refrigerators during the fall and winter than formerly. The capacity of their new factory is now 100 Refrigerators daily. It will be run to its full capacity during the summer, fall and winter to accumulate stock, so that prompt shipments can be made in the future. Their assortment of Refrigerators is now complete.

The National Carriage Spring Manufacturers' Association held a regular meeting at the Monongahela House, Pittsburgh, on Wednesday, the 11th inst. E. H. Bourne, of Cleveland, was chairman, and G. S. Smith, of Fort Plain, N. Y., acted as secretary. There was an unusually large attendance, members being present from all over the country. In contrast with the Axle manufacturing business, the trade in Springs was reported to be in a very favorable condition. It is not only good at present, but the outlook is very encouraging. The advisability of merging the organization into the National Carriage Builders' Association was discussed. It was unanimously decided to go into the general association. A committee of three

was appointed to attend to the preliminaries necessary to the consolidation. The committee was composed of E. H. Bourne, of Cleveland, president of the National Carriage Spring Association; G. S. Smith, of Fort Plain, N. Y., and E. R. Irwin, of Pittsburgh.

The Chicago Wire and Spring Company, 154 Lake street, Chicago, now own and operate the works of the late Grant Wire and Spring Company, at Lockport, Ill. They manufacture Tinned and Spring Wire, but devote special attention to the production of Upholsterers' and Cabinet-Makers' Springs, finding the best outlet for their works in that direction. They aim to produce a high quality of goods and find their efforts are appreciated. The demand has so greatly increased that they have been obliged to put more machinery in their Spring department this month to enable them to fill orders with reasonable promptness. Millard R. Powers is president and J. C. Reynolds is secretary and treasurer of the company.

The trade will observe the advertisement on page 63 relating to Peter Wright's Anvils and calling attention to an imitation of their brand, against which the trade are cautioned.

The Todd-Donigan Iron Company, Louisville, Ky., have issued a very convenient and creditable catalogue, the first published since the organization of the company in 1881. It relates to supplies for mines, railroads, machinists, quarrymen, blacksmiths, boiler-makers, wagon-makers, fence builders, carriage-makers and railroad contractors, which are appropriately classified and fully illustrated in a substantially bound volume of 337 pages. It is evident that care has been taken in the preparation of the illustrations with a view to securing quality and effectiveness. Many of them, we are advised, were prepared especially for this volume, and made in Louisville, where also it is interesting to observe the fine paper of the volume was manufactured, the printing, binding, &c., being all done in that city, to which the excellence of the workmanship is very creditable. The large line of goods represented in the volume are carried in stock; some of them, such as Turn Buckles, Wire Rope Fastenings, Wire Rope Clamps, &c., as well as those goods shown on pages 63 to 75, including Hoisting Machinery, Derrick Castings, &c., are not kept in stock by other houses in that section.

In their advertisement on page 71 the Jetter Mfg. Company, Buffalo, N. Y., call attention to their goods, including Files, Screw-Drivers and Wrought Goods.

Horton, Gilmore, McWilliams & Co., Chicago, Ill., under date July 15, have issued a 16-page price current, in which they represent a line of Tin Plates, Metals, &c., Tin Shingles, Freezers, Water Coolers, Window Screens, Bicycles, Campaign Torches and other goods.

Our readers will observe the Special Notice on page 49, in which a gentleman of long experience in the Wholesale Hardware and House-Furnishing business announces, under the *nom de plume* "Energy," his desire for a position in this city or elsewhere. His qualifications are referred to, and the fact that the best references can be furnished.

Whitfield & Jacobs, Pontiac, Mich., manufacturers of the Buckell Safety Clevis, advise us that they have recently made a great improvement in the appearance of their Clevises by giving them a handsome coat of japan. They are also furnishing to dealers who desire them a well-finished sample board to hold one each of the different sizes of their Clevises. They are made in easel form to stand on the counter or floor, are painted bright red

and varnished, and when furnished with the Japanned Clevises are said to be very attractive in appearance.

Carl F. Boker, 93 John street, New York, announces that Asbeck, Osthaus, Eicken & Co., Hagen, Germany, have placed in his hands the sole agency for the United States and Canada for their Steel Music Wire for pianofortes and springs. This Wire is referred to as well known for its superior quality. Mr. Boker states that he keeps a large stock on hand for springs, which is especially manufactured for this purpose. His circular also states the sizes in which Wire is made.

The American Screw Company, Providence, R. I., send out in very neat form a sample of their new rolled Screw. One of the new Screws and one of the old are inserted in wood, which is cut open to show the manner in which the two Screws enter the wood. They call attention to the superior point of the new Screw, which enters the wood easily, to its deep thread, giving greater holding strength, and to the small shank, which avoids splitting the wood, and requires but one boring for hard wood.

As appears by the advertisement on page 69, it will be seen that Wm. H. Caldwell is successor to the Andrus Mfg. Company, Rochester, N. Y. In carrying on the manufacture of the interesting Hardware specialties formerly made by that company Mr. Caldwell will have the best wishes of the trade for his success.

Walter Hart, 65 Stone street, New York, issues a circular devoted to the National Flagstaff Bracket, which shows the separate parts and the use of the Bracket. By the announcement on page 49 it will be seen that Mr. Hart calls attention to these Brackets, and his desire to make arrangements with houses in the principal cities to handle the goods.

An interesting game of base-ball took place at the Prospect Park base-ball grounds last Saturday between the employees of Wm. Bryce & Co. and H. L. Judd & Co. The game was well played by both clubs. The result was the latter were vanquished, the score being Wm. Bryce & Co., 7; H. L. Judd & Co., 6.

W. B. Barry Saw and Supply Company, Indianapolis, Ind., have issued their catalogue and price list for the current year. It is a conveniently arranged pamphlet, which represents their line of goods, with mention of related specialties and tables for reference. The company call attention to the fact that some important changes have been made in prices, and that some valuable additions have been made in the line of Saw Tools.

E. K. Sargeant, Brockville, Ont., issues a circular relating to Sargeant's Process Coffee Pot and Urn, which was patented in Canada March 31, 1886, and in the United States May 1, 1888. Besides the ordinary line of Coffee Pots made on this principle the circular describes large Coffee Machines for making from 11 to 20 gallons at a time.

Worcester Ferrule Company, Worcester, Mass., have obtained a patent for improvements in Knobs for dampers or registers, the object of the invention being to produce a Knob which will cause the slide to which the Knob is attached to fit more closely to the door. This is accomplished by means of a coiled spring bearing at its opposite ends against the nut and the inner face of the cap plate.

The Cincinnati Wire Company, Cincinnati, Ohio, have issued their standard price list No. 2, which contains the card for Standard Wire Nails, and also the Miscellaneous Wire Nail list, with the memoranda of extras which we referred to in our last issue as decided upon by the manu-

facturers. The whole is conveniently arranged, and will be appreciated by the trade. In the circular accompanying it the company call attention to the fact that their factory is equipped with the most modern machinery, and manned by the best class of nailers, and has a capacity of 600 kegs per day.

The Henry C. Hart Mfg. Company, Detroit, Mich., have issued a catalogue of specialties for the Toy trade. It includes Safes, Savings Banks, Toy Cannon, &c. The Cash Register Bank is an interesting and recent addition. It has a device for registering the amount of cash contained in the Bank.

On the 2d inst. the partnership heretofore existing between F. D. Butterfield and H. S. Haskell, under the name of Butterfield & Co., Derby Line, Vt., was dissolved by mutual consent. The manufacture of Stocks, Dies and Taps for blacksmiths', machinists' and steam fitters' use will be continued by F. D. Butterfield and F. G. Butterfield under the same style as heretofore, they having succeeded to the business of the late firm.

Trade Topics.

With reference to uniformity in marking goods, as advocated in the letter of a correspondent in a recent issue, we have the following from a Missouri Hardwareman:

I noticed an article in your paper on uniformity in marking goods, which seems to me looks well on paper. It is, however, mighty hard to lay down a cast-iron rule to sell by. No doubt your correspondent has reference to running the business in a city of some size, where a cash trade is possible. But what rule would he advocate for the country merchant who not only does not sell for cash, but all the way from one to six months' time, or longer? Now if we make a cast-iron rule and charge our cash customer the price marked on the goods, what shall we do with those who settle up twice or three times a year? It will not do to charge them a little more on every article that we sell, for they would object. How is this to be regulated? Or if we were to increase the margin, so as to take in our six months' customer, would that be doing justice to the man who paid us in 15 or 30 days? Or, supposing a customer comes in who sometimes pays cash and at other times does not and asks for a certain article, and, expecting him to pay the cash, we name the cash price to him; he takes it and walks out without saying anything about paying for it. So, of course, it must be charged. The same day or a few days later another credit customer comes in and asks for the same article and we ask him the regular credit price charged him. As our trading is nearly entirely with farmers who come to town on a rainy day, and will spend nearly all the day in town talking about tariff, crops, &c., it often happens that farmer No. 1 will meet farmer No. 2 on the street: "Buy a Fork?" "Yes." "How much?" "50 cents." "50 cents! Why I only paid 45 cents for mine." That settles No. 2 and he is going to have revenge, either by raising a racket or by stopping buying from a man who charges him more than he does his neighbor. I trust your correspondent will give us a little more light on this subject, as it is a very interesting one, and oblige A COUNTRY DEALER.

Referring to the combination between the foreign manufacturers of Screws, which we announced in our last issue, the London Ironmonger, July 7, remarks editorially:

The condition of the Screw trade for a long time past had been exceedingly unsatisfactory to the firms engaged in it, and the keenness of competition had led to such constant cutting of prices that profits were in many instances re-

duced to such fine proportions that the business was not worth having. In the end, this state of things has led to the arrangement under which the various leading markets are carefully apportioned, and prices are regulated so as to yield the makers what they consider a proper return for their capital and skill. The British home trade, naturally enough, is left exclusively to Nettlefold's, while the German home market is to be supplied exclusively by German makers. The French market naturally falls chiefly to the share of Japy Frères. As to Belgium, Switzerland, Scandinavia, Russia, Austria and the East of Europe, Italy, Turkey, Spain and Portugal, we are without definite information at the moment, but it is understood that the whole of these markets have been "arranged" in a manner which will be satisfactory to all parties concerned. All other markets—that is to say, all countries outside Europe—are, it is stated, to be supplied at a present discount of 72½ per cent. off Nettlefold's list, and it is understood that this part of the business is to be done on the principle known in America as "pooling." What the immediate effect of the arrangement upon prices will be we cannot state until the new lists or revised discounts are made known, but it is stated that net prices will be advanced by nearly 60 per cent. Of this, however, we have not definite information, and merely repeat what is stated by those who assert that they have knowledge to that effect. If that is the case, then it cannot be said that the new "arrangement" errs on the side of modesty, but exacts a very considerable penalty from consumers for the benefits they have derived from the competition of recent years. Whether the combination, as a whole, is wise from a British point of view we are scarcely in a position to state from the rather scanty details in our possession. On the face of it, however, it appears as though Nettlefold's had surrendered the foreign markets, or some of them, rather lightly, yet we are bound to assume that the managers of that concern have paid due regard to the "British interests" involved, and have not made concessions to their foreign competitors (friends now, we suppose) without obtaining equivalent advantages in other directions.

The James L. Haven Company, Cincinnati, Ohio, issue a sheet containing the following net prices to dealers on Sorghum Mills, Evaporators, Corn Crushers, Shellers, &c. The implements and machinery referred to in this price list are described and illustrated in other pamphlets:

The Economist Cane Mill.

No. 0, Steel shafts, 2 rolls. Capacity, 50 gallons per hour; weight 365 lbs. Price, \$17.50

The Pioneer Cane Mills.

Wrought steel shafts, turned bearings, gearing cast separate from the rolls and bored, rolls turned, brass boxes, feed boxes and patent step preventing clogging.

No. 00. Capacity, 50 gallons per hour.

Weight, 360 lbs. Price, \$20.00

No. 1. Capacity, 70 gallons per hour. Weight,

550 lbs. Price, \$27.50

No. 2. Capacity, 105 gallons per hour.

Weight, 750 lbs. Price, \$36.00

No. 3. Capacity, 134 gallons per hour.

Weight, 1000 lbs. Price, \$45.00

New South Cane Mills.

Steel shafts, flanged rolls, separate gear, brass boxes.

No. A. Light one-horse. Estimated capacity, 40 to 60 gal. per hour. Weight, 450

lbs. Price, \$20.00

No. B. Regular one-horse. Estimated capacity, 60 to 75 gal. per hour. Weight, 600

lbs. Price, \$27.50

No. C. Heavy one-horse. Estimated capacity, 75 to 90 gal. per hour. Weight, 725

lbs. Price, \$35.00

No. D. Regular two-horse. Estimated capacity, 90 to 100 gal. per hour. Weight, 1100 lbs.

Price, \$45.00

Champion Horizontal Cane Mills.

Letter A. One-horse. Approximate weight,

800 lbs. Capacity per hour, 60 gals. Price, \$27.50

Letter B. One or two horse. Approximate

weight, 700 lbs. Capacity per hour, 75

gals. Price, \$35.00

Letter C. Two-horse. Approximate weight,

900 lbs. Capacity per hour, 100 gals. Price, \$42.50

Cook's Patent Combined Portable Evaporators.

Including Pan, two Skimmers, Rocker Furnace,

Grate and Chimney.

Size of pan. Syrup per day. Acres cane per season.

No. 2. 44 x 72 in. 30 to 40 gals. 6 to 8

No. 3. 44 x 90 in. 40 to 60 gals. 8 to 12

No. 4. 44 x 108 in. 50 to 80 gals. 12 to 48

No. 5. 44 x 126 in. 70 to 100 gals. 20 to 30

With galv. Approx. weight, copper pan. weight.

No. 2. \$17.50 250 lbs. \$12.50 275 lbs.

No. 3. 21.00 275 lbs. 50.00 300 lbs.

No. 4. 24.50 300 lbs. 60.00 350 lbs.

No. 5. 29.75 350 lbs. 75.00 400 lbs.

With these Evaporators the following sizes of Mills can be used, but we recommend a Pan one size larger:

With No. 2, No. 0 Economist, A Western.

With No. 4, No. 1 Pioneer, B Western.

With No. 3, No. 0 Pioneer, A Champion.

With No. 5, B Champion, C Western.

Get an Evaporator large enough.

Cook's Patent Pans for Brick Furnace.

Galvanized iron or copper, with two skimmers complete.

Size of pan. Syrup per day. For acres.

No. 2. 44 x 72 in. 30 to 40 gals. 6 to 8

No. 3. 44 x 90 in. 40 to 60 gals. 8 to 12

No. 4. 44 x 108 in. 50 to 80 gals. 12 to 18

No. 5. 44 x 126 in. 75 to 120 gals. 15 to 30

No. 6. 44 x 144 in. 100 to 140 gals. 20 to 35

No. 7. 44 x 180 in. 125 to 175 gals. 30 to 45

Approx. Galv. Heavy

No. 2. weight. iron. copper.

No. 3. 100 lbs. \$8.75 \$30.00

No. 4. 125 lbs. 10.50 37.50

No. 5. 150 lbs. 12.25 42.50

No. 6. 165 lbs. 15.75 55.00

No. 7. 180 lbs. 19.25 65.00

No. 8. 230 lbs. 22.75 75.00

With these Pans the following sizes of Mills can be used, but we advise a Pan one size larger.

It is poor economy to use too small a Pan.

With No. 2, No. 0 Economist, A Western.

With No. 3, No. 0 Pioneer, A Champion.

With No. 4, No. 1 Pioneer, B Western.

With No. 5, B Champion, C Western.

With No. 6, No. 2 Pioneer, C Champion, D

Western.

With No. 7, No. 3 Pioneer.

Cook's Patent Furnace, with Grate and Chimney.

(No Pan.)

No. 2. For Pan, 44 x 72 in. Weight. Price.

No. 3. For Pan, 44 x 90 in. 200 lbs. \$10.00

No. 4. For Pan, 44 x 108 in. 215 lbs. 12.00

No. 5. For Pan, 44 x 126 in. 225 lbs. 14.00

No. 6. For Pan, 44 x 144 in. 250 lbs. 16.00

Furnace Doors and Grate Bars.

To be used with Evaporator Pans for Brick

Furnaces.

No. 1 Furnace Door, 16 x 18 in. \$3.00

No. 4 Grate, 18 x 33 in. 1.50

Haven's IXL Cider Mills.

With Double Cranks.

Senior, with double cranks and adjustable

feed rollers. Price, \$18.00

Medium, with one crank and adjustable feed

rollers. Price, 15.00

Junior, with one crank and adjustable feed

rollers. Price, 11.50

Haven's IXL Power Cider Mills.

No. 1. Rollers 10½ in. long by 8 in. diam.

Capacity, 100 to 200 bushels per hour

Price, \$60.00

No. 2. Rollers 14 in. long by 12 in. diam.

Capacity, 200 to 400 bushels per hour

Price, 100.00

Cider-Press Screws—Cast.

For Hand or Power Mills.

5 ft. long, 4 in. diam. Price, each, \$11.00

Little Giant Corn Crushers.

Complete, with Box, Hopper and Sweep.

No. 1. 2-cone, 1-horse, 5 to 8 bushels per

hour. Price, \$18.90

No. 2. 2-cone, light 2-horse, 7 to 10 bushels

per hour. Price, 22.00

No. 3. 3-cone, 2-horse, 8 to 12 bushels per

hour. Price, 29.70

No. 4. 3-cone, 3-horse, 12 to 20 bushels per

hour. Price, 37.80

This is the old and favorite pattern of Little

Giant, of which more have probably been sold

than of all other styles combined.

Excelsior Feed Mill.

Force Feed and White Iron Grinders. Complete

with Box, Hopper and Sweep.

No. 4. Estimated capacity, 5 to 15 bushels of

meal per hour, according to fineness

ground. Weight, 425 lbs. Price, \$24.80

Warranted to be well made of good material,

and to work well when properly managed.

Haven's IXL Corn Shellers.

Single, with Separator. Price, \$5.50

Single, with Separator and Fan. Price, 6.00

Extra for Hopper or Feed Table. Price, .40

Double, with Separator, Fan, Feed Table,

Crank and Pulley for power. Price, \$13.00

Eagle Corn Shellers.

Single, with Separator. Price, \$6.00

Single, with Separator and Fan. Price, 6.75

Extra for Hopper or Feed Table. Price, .50

Double, with Separator, Fan, Feed Table,

Crank and Pulley for power. Price, \$14.00

Horse Powers.

Light, with two Levers and Tumbling Shaft

and Pulley. Price, \$28.00

Heavy, with two Levers and Tumbling

Shaft and Pulley. Price, \$45.00

Heavy, with four Levers and Tumbling

Shaft and Pulley. Price, \$48.00

Road Scrapers.

No. 2, 28 in. wide; weight, 90 lb. Price, \$3.50

No. 3, 29 in. wide; weight, 100 lb. Price, 4.00

Sanford's Patent IXL Perfect Cutting Boxes.
For Hay and Straw.

No. 1, with 40 knives. Weight, 150 lbs. Price, each.....	\$6.75
No. 2, with 40 knives. Weight, 100 lbs. Price, each.....	5.00
No. 3, with 30 knives. Weight, 60 lbs. Price, each.....	4.00

Haven's IXL Lever Cutting Boxes.	
No. 0, 10-inch curved knife. Weight, 45 lbs. Price, each.....	\$3.60
No. 4, 11-inch curved knife. Weight, 55 lbs. Price, each.....	4.50
No. 3, 11-inch straight knife. Weight, 55 lbs. Price, each.....	3.60

The Eagle Hand Cutters.	
No. 0. One 8-in. knife, self-feed, geared 4 to 1, cuts $\frac{1}{4}$ or $\frac{3}{8}$ in. hay or straw, weight, 100 lbs. Price, each.....	\$8.70
No. 8. For hay, straw or fodder, 8-in. knife, cuts $\frac{3}{8}$ to $1\frac{1}{4}$ in., stop-feed, weight, 150 lbs. Price, each.....	11.40

No. 1, painted White, or any color to order. Price, each.....	\$3.80
Morning Glory Chair.	
No. 2, painted White, or any color to order. Price, each.....	\$4.95

Export Trade.

In the existing condition of domestic business, in which in many lines there is a capacity of production beyond the requirements of the trade, manufacturers are giving increased attention to export trade, and it is gratifying to observe that American Hardware is going in enlarged quantities and in greater variety of goods to foreign markets. As indicating something of the extent of our export business and the class of goods that are going abroad, we give the following detailed statement of shipments in the Hardware and related lines that have recently been made:

PER BARK ABIEL ABBOTT, FOR BRISBANE, QUEENSLAND.

By *Arkell & Douglas, New York*.—700 dozen Handles, 100 dozen Shovels, 50 dozen Picks, 40 dozen Axes, 350 dozen Handles, 22 Lawn Mowers, 20 dozen

Shovels, 10 dozen Spades, 12 dozen Rakes, 50 dozen Handles, 1 gross of Egg Beaters, 1 dozen Saws, 12 dozen Lanterns, 24 dozen Choppers, 20 dozen Shovels, 14 gross Axle Grease, 10 dozen Pulleys, 335 pounds of Nails, 1 case of Hardware, 2 dozen Hay Knives, 10 dozen Saws, 224 pounds Oil Stone, 2 dozen Braces, 1 dozen Sieves, 3 Bracket Saws, 5 packages of Hardware, 3 dozen Traps, 50 dozen Handles, 1 dozen Scales, 36 dozen Butts, 7 dozen Planes, 54 dozen Choppers, 6 dozen Saws, 7 packages of Hardware, 134 dozen Axes, 1 dozen Grindstones, 3 dozen Hand Screws, 1750 pounds of Axles, 6236 pounds of Castings.

By *V. Busanta, New York*.—50 dozen Shovels, 21 Churns, 6 dozen Manure Forks, 74 gross Fruit Jars, 34 dozen Plated Ware, 12 dozen Hay Forks, 4 dozen Wrenches, 12 dozen Liquid Glue, 54 gross of Locks, 1 gross of Gate Hinges, 6 dozen Twine Boxes, 2 dozen Money Drawers, 6 dozen Plumbs and Levels, 225 dozen Saws.

By *Reed & Barton*.—3 packages of Plated Ware.

By *H. W. Peabody & Co.*—600 dozen Handles, 39 dozen Blocks, 87 dozen Hay Forks, 1 case of Hardware, 3 Mowers.

BARK TILLIE BAKER TO MELBOURNE.

By *R. W. Cameron & Co.*—40 dozen Tools, 2 cases Sandpaper, 13 cases Castings, 1145 pounds of Bolts, 2 cases Carpet Sweepers, 1 case Hardware, 6 cases Forks, 3 cases Axles, 30 kegs of Nails, 6 boxes Hinges, 3 boxes Hammers, 1 box Castings, 9 cases Hubs, 10 cases Axles, 25 cases Roofing Slates, 1 case Fire Arms, 10 cases Axes.

By *McLean Bros. & Rigg*.—12 dozen Blacking Brushes, 5 dozen Apple Parers, 3 cases Electrical Apparatus, 3 gross Can Openers, 4 dozen Twin Screws, 36 Scales, 18 Jacks, 1 dozen Hog Rings, 2 dozen Grindstones, 4 dozen Hammers, 1 case Door Springs, 1 dozen Drills, 1 case Primers, 6700 pounds of Nails, 1036 pounds of Nails, 1900 pounds of Rivets, 110 dozen Axes, 84 gross Axle Grease.

By *Simpson, Hall, Miller & Co.*—950 pounds Plated Ware.

By *W. K. Freeman*.—3 cases Plated Ware.

By *Morris, Strouse & Co.*—3 packages Roller Skates.

By *R. W. Forbes & Son*.—72 dozen Gate Hinges, 8 cases Hardware, 1181 pounds of Wire Netting, 20 packages Hardware, 500 pounds Stone, 865 pounds Carriage Bolts, 110 sets of Axles, 2 packages Hardware, 17 packages Carriage Woodwork, 22 packages Hardware, 12 dozen Oilers, 6 dozen hammers, 14 packages Hardware, 3 packages of Pumps, 18 dozen Hatchets, 75 kegs Nails, 153 packages Carriage Woodwork.

By *Healy & Earl*.—1 box Dies and Rings, 16 cases Grain Mills, 4 cases Grain Mills, 1 box Wrenches, 2 cases Sandpaper, 1 case Emery-Wheels.

By *Arkell & Douglas*.—9 dozen Saws, 113 pairs Roller Skates, 5380 pounds of Bolts, 4 cases Hooks, 13 dozen Saws, 14 dozen Choppers, 9 dozen Forks, 9 dozen Axes, 36 dozen Handles, 6 dozen Hammers, 14 dozen Churns, 2 gross Wall Hooks, 3 dozen Sifters, 15 dozen Axes, 3 dozen Axes, 3935 pounds of Bolts, 16 dozen Saws, 14 dozen Wrenches, 24 dozen Hatchets, 1 dozen Guns, 67 pounds Tacks, 1 case Wall Hooks, 6 dozen Gate Hinges, 1 dozen Banks, 3 dozen Toys, 140 dozen Handles, 10 dozen Axes.

By *Meriden Britannia Company*.—7 packages Plated Ware, 2 boxes Plated Ware, 17 packages Plated Ware, 25 packages Plated Ware, 2 boxes Plated Ware, 5 boxes Plated Ware.

By *Russell & Erwin Mfg. Company*.—28 cases Hardware.

By *Hammacher & Delius*.—42 packages Hardware.

By *C. Walker*.—1 box Harrows.

By *W. H. Crossman & Bro.*—684 dozen Handles.

By *Martland, Phelps & Co.*—19 gross Swivel Snaps.

By *H. W. Peabody & Co.*—27 cases Mowers, 1983 pounds of Axle Grease, 6198 pounds Barb Wire, 30,682 pounds Barb Wire, 1 Refrigerator.

By *Coombs, Crosby & Eddy*.—15 dozen Hay Forks, 24 dozen Axes, 1 dozen Scales, 200 dozen Carpenters' Tools, 12 cases Axle Grease, 30 Wrenches, 80 dozen Carpenters' Tools.

By *Peck, Stow & Wilcox Company*.—13 boxes Tinsmiths' Tools.

By *Page, Dennis & Co.*—3 Refrigerators, 1 box Hardware, 1 package Trucks.

By *Reed & Barton*.—7 packages Plated Ware.

By *Rogers, Smith & Co.*—7 packages Plated Ware.

Arrangement of Stores.

McGibbon & Tarbox, Hancock, N. Y., furnish us material for description of Cross-cut Saw Case, which is shown in Fig. 254, which is referred to by them as exceedingly convenient and economizing space very satisfactorily. Saws are inserted top first

Fig. 254.—Cross-Cut Saw Case.

into slots back of the top board, part of which is shown broken away to indicate the construction. They are thus kept from falling forward, and are easily and quickly removed as desired. The Case, as shown, accommodates 12 each 6-foot and 54-foot Cross-cuts, and it is obvious that the same principle can be further applied for the accommodation of other sizes. The side pieces are made of wood $\frac{3}{4}$ inch thick and 7 inches wide. Their width at the top is 4 inches. The Rack stands against the wall.

The Paddock-Hawley Iron Company, of St. Louis, write us that they are informed that John Zamarana, a young Mexican formerly in their employ, has been using their name as reference without any authority from them.

Gillingham's Self-Sealing Cans.

The illustration given below represents these cans, which are made by the Postal Package Company, 34 South Paca street, Baltimore, Md. They are made in leading sizes from 2 x 2 to 4 x 7 inches. As indicated in the cut, the cans and tops are

Gillingham's Self-Sealing Cans.

threaded so as to give a simple and effective cover, which can be easily and quickly opened or closed. In the top of each cover there is an oil-proof washer that rests on the flange of the can, rendering the can, it is claimed, perfectly tight. The special advantage claimed for these cans is that they require no cement, solder or tools, and that as they are not destroyed in opening they will last for years. The company advise us that in addition to the demand for this article by families and other consumers dealers in paints are buying paints, &c., in bulk and putting them in cans with their own label, giving them an extra profit, which they could not make before, as they had no facilities for soldering on the top of the old style cans.

Improved Staples.

The Wire Goods Company, Worcester, Mass., are putting on the market a line of improved Wrought Staples, which, they advise us, is now complete. One of them is represented in the illustration given below. The special feature of these

Improved Wrought Staples.

goods, which are patented, is that the arms of the staples are the same size all the way down, so that they hold, it is claimed, with the well-known tenacity of a wire nail. It is pointed out by the company that hand-forged staples, or rolled or sheared staples, taper from the point to the limit of the part that goes into the wood, so that the staple rests in a tapering

socket. Hence, it is claimed, it is necessary to clinch the ordinary staple. With this staple the point is made that no clinching is required, the staples holding with sufficient tenacity without it. For this reason it is intimated that a much smaller size of staple will answer the purpose of a larger staple of the ordinary kind. It is further stated that staples made by this process are very uniform in size, and of unusually neat appearance. The company are now ready to supply all sizes, and put them on the market as wrought staples only, and also packed in the various forms of hook and staple, ring and staple, &c.

Weather-Proof Window.

G. W. Everett, No. 11 East Tenth street, New York, is directing attention to a weather-proof window which he is in-

Fig. 1.—Horizontal Section Through Window Frame, Showing Application of Everett's Weather Proofing.

roducing. Fig. 1 of the engravings represents a horizontal section through the window frame, showing the inside and outside stops, parting strip and the sash. It will be noticed the special feature of improvement is a section of rubber introduced into the sash, for the reception of which a segmental groove is cut in the parting strip. The effect of this construc-

Fig. 2.—Vertical Section Through Meeting Rail with Everett's Improvement.

tion is to cause the rubber, by its elasticity, to spring outwardly against the parting strip, making the construction wind-tight. Fig. 2 of the engravings is supposed to represent a vertical section through the meeting rail of the window. The same feature, it will be noticed, is applied to the upper sash, with the exception that there is not the corresponding groove for receiving the rubber. The wedging of the rubber strip between the two parts of the meeting rail makes a wind-tight joint

at this place. The inventor asserts that the device can be applied to old or new work, and he is at present arranging for agencies to handle the material which he supplies and to put it in place with special tools, which he also provides.

The Picnic Lamp-Stove.

M. L. Hull, of Cleveland, Ohio, is offering the trade a neat gasoline lamp-stove, which he designates as the *Picnic*,

The Picnic Lamp Stove.

an illustration of which is shown in the accompanying engraving. This stove is designed to occupy a place not filled by anything at present on the market, and is adapted for light housekeeping, picnics, camping parties, &c. It is simple of construction, well made in all its parts and weighs only 3½ pounds. The grate to hold cooking vessels is made of sheet steel: the burner has but one valve, and the tank has a capacity for sufficient gasoline to keep the stove in operation for 5 or 6 hours. The manufacturer states that the wooden handle to the needle valve is of recent invention, and permits shortening the valve rod without burning the hand. The construction of the stove is such that a drum may be placed above the burner, transforming it into a convenient heating stove. The pressure is easily regulated by an ingenious device in the filler screw. The stove is also adapted for use as a sad-iron heater. The claim is made that it can be placed upon the ironing-board or table where it is convenient to the operator and thus does away with the necessity of keeping a hot coal fire during the summer months. The stove

is light yet strong, and capable of sustaining any cooking vessel it may be desired to use.

The Bank of America has just filed plans in the Building Department for the erection of a superb eight-story building at Nos. 44 and 46 Wall street, to cost \$400,000. The building will have a frontage of 69 feet and be 80 feet deep. The front will be of granite and limestone.

Solid Link Chain.

A novelty in chains adapted for various uses is being introduced by the Solid Link Chain Mfg. Company, No. 51 John street, New York. One form of the chain is

Fig. 1.—Solid Link Chain for Window Sash, &c.

shown in Fig. 1, and is approximately full size. It is that form which is adapted to be used for sash weights, with sash of medium to large size. Fig. 2 of the engravings shows how it is to be applied. The chain is also adapted for many other uses, among which may be mentioned belting and chains for ornamental purposes. When used for sash weights, it has the advantage of being very nearly of the same section as the ordinary cord used for the purpose. In other words, it is very nearly round, and is not liable to be damaged by twisting. As indicated by the name, it is composed of solid links, and is the product of some very ingenious machinery. The chains of this general class have been commonly constructed so that the cross portion in each link between the bends which connect it with the loops of the link, is curved in a direction opposite to the direction in which the loops are presented. The consequence is that when strain is applied to the chain the loops of each link have a tendency to draw and come together at the middle of the cross portion of the link which they embrace, thus impairing the flexibility of the chain. It is claimed that the chain here shown overcomes this difficulty entirely. The links, in order to

Fig. 2.—Sash and Weight Connected With Solid Link Chain.

simulate the appearance of wire, are stamped from flattened wire, thus securing round edges. The chain is manufactured in several different forms, as well as in the cable shape here illustrated.

The Kentucky Wagon Mfg. Company, W. C. Nones, manager, manufacturers of the Old Hickory wagons, will soon move

into their new works, which are erected at South Louisville, a suburb of Louisville, Ky., and are built on a very large scale. They have bought the good-will, trademark and works of the Tennessee Wagon Works, operated by Cheny, Morrow & Co.,

inside the penitentiary of Nashville, Tenn. The latter parties will retire from the business at the expiration of their lease of the convicts, January 1st, 1890, and both members of the firm will be stockholders in the mammoth new factory at Louisville. The two brands of wagons made will be

well for light pressures. The difficulty with the use of this type of pipe or turbine was that when the pipe became old and weakened by decay it was liable to accidents, especially those caused, whenever the gates were closed quickly, by the impact of the energy of the water flowing through the wheel. The present water supply of Tokio, Japan, is by the wooden water-pipe system, which has been in existence over 200 years, furnishing at present a daily supply of from 25,000,000 to 30,000,000 gallons. There are several types of water-pipes in use, the principal class being built up with plank, square, and secured together by frames surrounding them at close intervals. The pipes, less than 6 inches, consist of bored logs, and somewhat larger ones are made by placing a cap on the top of a log in which a very large groove has been cut. All the connections are made by chamfered joints,

Window Guard, Manufactured by J. E. Bolles & Co., Detroit, Mich.

the Old Hickory and Tennessee, and the new works are being built with capacity to increase the output of both, which aggregated last year over 30,000 farm wagons. The Kentucky Wagon Mfg Company will be operated by free labor entirely, giving Louisville's skilled workmen a larger field.

Wood Water-Pipes.—All of the earlier water-works in America used mains of wood constructed out of what is known as pump logs, or timber bored from end to end by means of a pump auger, and pointed at one end so as to fit into the countersink at the end of the next log, the space between the two being caulked with oakum. It is known that these pump logs have certainly lasted nearly a century in some locations, although they are of course not to be compared with cast-iron pipes used for such purposes. In some portions of the western part of the United States they are using large water mains built of staves, made up similarly to a wooden trunk sometimes used to furnish a supply of water to turbines, and it is found that they answer their purpose very

and cracks are caulked with an inner fibrous bark. Square boxes are used in various places to regulate the uniformity of the flow of the water, which is rather rapid, for the purpose of preventing aquatic growth. The water is not delivered to the houses, but into reservoirs on the sides of the streets, nearly 15,000 in number.

Iron Window Guard.

Every year shows more and more taste displayed in design as well as in features of construction of wrought-iron work. Not only do the architects vie with each other in producing appropriate designs in work of this class for use in various places, but manufacturers as well give special attention to forms in which their material may be worked to produce graceful effects, while at the same time accomplishing the special objects in view. The accompanying design represents a window guard recently brought out by J. E. Bolles & Co., of Detroit, Mich. The parts are clearly defined and the work speaks for itself.

Automatic Screw-Driver.

The Shaver Corporation, No. 157 Broadway, New York, are introducing what is known as Shaver's Automatic Screw-Driver, an illustration of which is presented in the annexed engraving. The screw-

Shaver's Automatic Screw-Driver.

driver is of the spiral variety, the shank being twisted and working through proper mechanism in the ferrule of the handle, as shown. It differs in various details of construction from other spiral screw-drivers which we have illustrated in the past, and is of a size and character to be very useful for both amateurs and mechanics. The handle itself, which in the sample before us is made of hard wood, measures 9 inches in length. When the screw-driver is extended the total length is 17 inches. The handle where the hand would grasp it is nearly 2 inches in diameter, dimensions which constitute it of more interest to mechanics than is usual with tools of this class. Another advantage is its lightness. The cut shows the method of holding the tool at the beginning of the stroke, the dotted line showing the position of the handle at the end of each stroke. The makers mention that the screw may be driven with this tool without any hole being prepared for the screw, the driver being so powerful that the screw, including the countersink, can be forced into soft wood without difficulty. The whole operation for driving an ordinary screw is accomplished by three straight thrusts of the hand, using, the makers assert, no more power at each thrust than is required by the ordinary method.

An agent of the Government of Mexico is visiting New York and Pittsburgh for the purpose of making contracts for a dozen light-houses for the Pacific Coast. A contract will probably be made for the

first two in America, and if terms are satisfactory as against the English, the balance will be made in this country also.

Combined Bench and Tool Chest.

In the accompanying engraving we present a general view of a work-bench and tool-cabinet, being a novelty that has been introduced to the English trade by R. Melhuish & Son, of London, England. As it has many features of interest, we have believed our readers would be pleased with a description of it. It will be noticed that, in addition to the space afforded by the drawers, which occupy the principal portion of the front, a receptacle for tools is provided at either end, inside of swinging doors. In turn the lid is utilized, as is clearly shown in the cut, and only when it is raised is the work-bench brought into view. A vise for holding a board for working on the edge is shown, and also pins for supporting the opposite end of the work has thus been prepared it is painted

Combination Tool Cabinet and Bench for Amateurs' Use.

board. According to the description which has reached us this article, as prepared for the English trade, is made of dark walnut, polished. The doors are finished with self-acting catches. The bench itself is composed of well-seasoned beech, and the drawers have polished brass handles and are divided and subdivided to hold screws, hooks and nails, and the large variety of articles that are required in connection with an outfit of this kind. The statement is made that the whole of the six drawers, two cupboards and top can be instantly closed and fastened with one small lock and key, thus leaving the cabinet in the shape of a very pleasing piece of furniture. There may be a suggestion in this cabinet which some of our readers will work out for their own use.

The Society of Civil Engineers lately in session in Milwaukee, Wis., propose to put up a fire-proof structure in New York for the preservation of the society's records. The estimated cost of the building is \$140,000, and the available fund \$30,000, leaving \$110,000 to be raised by subscription.

Pa Crusta.

Pa Crusta is the name which has been adopted for a new mural and ceiling decoration that has been brought to public notice by the McDonnell-Mallen decorative Company, of Jacksonville, Ill. It is a rival of *lincresta walton* and *papier maché* in its decorative effects, but is vastly different in its preparation and application, as well as its low cost. As far as it is possible to ascertain the new process consists in the application to a suitably prepared wall or ceiling of ordinary brown wrapping paper, moistened with a paste which causes it to adhere to the plaster, and at the same time enables it to be molded into various designs by the hand. No molds are employed for the production of set figures and patterns, but, on the contrary, an irregular appearance is intentionally sought by the originators of this method of decoration. After the ground work has thus been prepared it is painted

in bronze, silver, or any other style of finish that may be desired. The ticket office of the Michigan Central Railroad, at the corner of Clark and Randolph streets, Chicago, is the first instance of the application of this method of decoration on a proper scale accessible to the public. In order to show its capabilities several styles of treatment have been here introduced, but without by any means exhausting the range, as other combinations continually suggest themselves to the artistic workman. It seems in a high degree unconventional, bold and striking in its originality. Those interested in the process claim that the application of this method of decoration is very simple, so that talented and therefore high-priced workmen are not absolutely essential to its successful arrangement. It is also very easily repaired if it is accidentally chipped, which is quite a favorable recommendation. It is the intention of the company to confine their work to dwelling houses and offices, avoiding saloons. In this way they claim a larger patronage will be assured among those who desire to see their houses look differently from drinking resorts.

CURRENT HARDWARE PRICES.

JULY 18, 1888.

Note.—The quotations given below represent the Current Hardware Prices which prevail in the market at large. They are not given as manufacturers' prices, and manufacturers should not be held responsible for them. In cases where goods are quoted at lower figures than the manufacturers' name, it is not stated that the manufacturers are selling at the prices quoted, but simply that the goods are being sold, perhaps by the manufacturers, perhaps by the jobbers at the figures named.

THE IRON AGE

THURSDAY, JULY 26, 1888.

The Bartlett Propeller.

Marine engineers particularly will be interested in the new form of screw propeller illustrated on this page, and designed by John E. T. Bartlett, of 253 West Fourteenth street, New York. During a recent visit to the Delamater Iron Works, where the propeller is turned out for Mr. Bartlett, who, we should add, is connected

distance from the axis. Local surface disturbance and currents were also to be avoided, all of which requirements seem to be met by the helicoidal parabolic surface of revolution which Mr. Bartlett adopted. It will be observed in Fig. 5 that a plane passed through the axis of the propeller shaft will intersect the blade of his design in a parabolic curve. This is designated by the figures 2, 0, 2 in Fig. 1.

pitch of the propeller. In Fig. 5 the lines *s s* indicate the flow of water to the wheel, partaking as it does of the contour of the run of the ship, as is actually the case in practice. After the particles of water have passed behind the blades the wheel will drive them, as previously stated, in a direction parallel to the axis of the shaft. The reason is readily apparent. The motion must be in either

Fig. 1.—Section and Plan.

Fig. 2.—Front Elevation Looking Aft.

Fig. 3.—Section through Blade of Common Propeller.

Fig. 4.—Section through Blade of Centripetal Propeller.

Fig. 5.—Section through Blade of Bartlett Propeller.

IMPROVED FORM OF SCREW PROPELLER, BUILT FROM DESIGNS BY J. E. T. BARTLETT, NEW YORK.

professionally with the works, we had an opportunity of examining more closely the features of the design; in the main these are very well represented in our engravings.

The improvement, as a glance will show, is in the shape of the propelling surface of the wheel blades, the aim being to give the water driven astern a direction parallel to the axis of the driving shaft, and also to prevent the water from being raised by the centrifugal force generated by the angular velocity of the propeller. Mr. Bartlett sought further to gain length of blade with given diameter, and to thus diminish the frictional resistance to be overcome by the engine in rotating the wheel at a given angular velocity. This resistance increases as the square of the

The base line of abscissae, marked 1, 0, 1, for determining the curve is assumed to pass through the center line 3 3 of the shaft, and midway of the length of the propeller hub. As many ordinates as may be necessary for accuracy in determining the curve are calculated, with the varying diameter values *d*, *d*₁, *d*₂, *d*₃, &c., using the parabolic formula $h = \frac{d^2}{x^2} \cdot \frac{1}{f}$, *h* representing the value of one ordinate, *f* the focal distance and *x* a constant. The driving surface will be a parabolic surface generated by the revolution of a semi-parabola, 0 2, whose vertex is 0, around the longitudinal axis 0 3, having at the same time a motion of translation, positive or negative, in the direction 0 3, equal to the required

one of two directions in virtue of the influence of a parabolic reflecting surface, and, as the water is incompressible, it cannot be forced to the focus *F*, and must, therefore, follow the lines *d d*. Mr. Bartlett explains that the air in the water behind the wheel will be compressed so that the latter will work in solid water, and less vibration will be occasioned by it than by other forms. The driving surface will act on the same principle as sound and light reflectors similarly constructed. Any particle of fluid passing behind the leading edge *A* of the propeller-blade will be forced back by the advancing surface of the propeller and the superposed particles prevented following or flowing off the blades by the reflect-

ing surface. Before any particle can acquire centrifugal force from contact with a rotating surface of high velocity it will have been left behind by the advancing propeller. Having no tendency to rise to the surface it will be reflected parallel to the axis of the shaft, as the least resistance is in the direction of the wake of the vessel. The increase in length of blades is clearly shown on the right-hand blade, Fig. 1, the length gained being the difference in length of the curved line 0 2 and the straight line 0 1.

Mr. Bartlett claims that the propelling surfaces which he adopts prevent the water from flowing off radially or tangentially, and that hence there are no waves on the surface caused by the rotation of the wheel. There would consequently be no tendency to wash away banks or scour the bottoms of waterways of small sectional area. We understand that trials with the propeller on several launches have shown it to give an appreciable increase of speed over that attained by the ordinary form of wheel, and to make as little commotion in the wake as is produced by the passage of a vessel under sail. The importance attached to both these points need not be emphasized. At present preparations are being made for fitting up a wheel for a 60-foot launch for the New York *World*, and the performance of the boat will be watched with interest.

The Russian Oil Pipe Line.

Referring to the contemplated construction of the Russian crude oil pipe line from Baku to Batoum, we find the following in *Engineering*, of London:

The promoters of the scheme are understood to have failed in their attempts to obtain funds for its construction in Paris, and of course, in the present condition of European politics, they are not very likely to be more successful at Berlin. The sum required for the undertaking is large—about £2,000,000—and the enterprise is handicapped by the fact that all the pipes must be manufactured in Russia, notwithstanding that at the present moment no pipe works exist there capable of turning out a short pipe line, let alone one 600 miles long. What has, however, chiefly impeded the success of the scheme up to now has been the bitter enmity of the Nobel firm, whose influence against it has been extended even to financial quarters. The Nobel firm carry on their refining operations at Baku, where they possess one of the largest, if not the largest, refinery in the world, and they have always opposed the laying down of a pipe line that would allow of petroleum being pumped in a crude condition to Batoum, and refined there under far more advantageous conditions than is possible at Baku. On this account, seeing their interests at Baku are imperiled by the crude pipe line scheme, they have maintained against it a war to the knife, and sought to promote instead a kerosene pipe line, or a pipe line that would pump only the refined product from Baku to the Black Sea.

In connection with this, we stated some time ago that it had scored an advantage by obtaining permission to put down the first section of the kerosene pipe line across the Suram Pass. Financial arrangements were being made to carry this through when Mr. Ludwig Nobel suddenly died. The result of this has been a check to the kerosene pipe line scheme also, and there is no present prospect of either it or the rival project being promptly carried out. Probably as soon as the Nobel firm is placed under new leadership, the kerosene pipe line will come to the front again, particularly as there are no onerous conditions attaching to its construction, and the demand for it is pressing on the part of the

oil exporters at Baku. With regard to the crude oil scheme the largeness of the sum required is a serious obstacle, and we should not feel surprised if the Elimoff concession fell through. This would not imply an abandonment of the idea on the part of Russia. On the contrary, the Government, in that case, would probably decline to construct it itself. From next January the Transcaucasian Railway from Baku to Batoum will become a State undertaking, and the construction of a pipe line would fall naturally to the control of a State department managing the petroleum traffic on the railway.

Monster Bridge Project.

New York City has been startled by the sudden introduction in Congress of a bill providing for the construction of an enormous suspension bridge across the River, between New York City and the North New Jersey shore. The bill referred to was introduced into the House June 27 by Mr. Cox, and is identical with that introduced in the Senate July 2 by Mr. Quay. The scheme is a most formidable one, as the proposed bridge, according to the designs of Gustav Lindenthal, the bridge builder of Pittsburgh, Pa., will cross the river in a single span 2860 feet in length, which is 1310 feet longer than that of the Brooklyn Bridge, and the weight of materials used must necessarily be more than double, far surpassing in all respects any similar structure now extant. The entire cost of such a work can only be estimated from imperfect data, as a difference of several millions must depend on the final choice of a terminus on the New York side, but, while the projectors of the scheme claim that \$16,000,000 will suffice, other engineers, perhaps not less competent, have named as high a figure as \$40,000,000. The plan is now on exhibition in the rooms of the House Committee on Commerce at Washington, and the incorporators named are: James King McLanahan, Jordan L. Mott, Henry Flad, J. Canda, James Andrews, Thomas F. Ryan, Gustav Lindenthal and William F. Shunk. All the parties are well known and peculiarly responsible. Jordan L. Mott is the large iron manufacturer of this city. James King McLanahan is a wealthy iron manufacturer of Hollidaysburg and Johnstown, Va. Henry Flad is president of the Board of Public Improvements of the city of St. Louis, was intimately connected with Captain Eads in the construction of the St. Louis Bridge, and was formerly president of the American Society of Civil Engineers. Charles J. Canda is the vice-president of the Western National Bank, of this city, and was formerly United States Assistant Treasurer here. James Andrews is a contractor of repute. He built the piers of the St. Louis Bridge and the works at the jetties of the Mississippi River. He is the successor of Captain Eads in the Tehuantepec Ship Railway project. William F. Shunk is a civil engineer, who was formerly chief engineer of the New York Elevated Railroad. Thomas F. Ryan is a banker of this city, of the firm of Smith, Oakman & Ryan. The author and projector of the proposed bridge, Gustav Lindenthal, is a member of the American Society of Civil Engineers, and his name is already identified with several important works in various parts of the country. Three of the bridges at Pittsburgh are evidences of his skill.

The bill authorizes the persons above named and their associates to build and operate a bridge across the Hudson River for the passage of railroad trains and other purposes, provided that said bridge shall be constructed with a single span over the entire river between the established pier lines in either State, and at an elevation over the river of at least 140 feet in the

clear above the level of ordinary high water, and that this minimum height shall be exclusive of the deflections of the superstructure from loads or temperature effects, and that no pier or piers or other obstructions to navigation, either of a temporary or permanent character, shall be placed or built in the river between said pier lines under this act. It is further stipulated that all railroad companies desiring to use the bridge shall be entitled to equal rights and privileges "for a reasonable compensation." The diagrams of Mr. Lindenthal's bridge indicate a structure in its main features similar to the East River bridge, except that there are double cables, one set below the other. There is a double tower on either side of the Hudson, with a single span suspended from gracefully bending cables. The length of the middle span is to be 2850 feet from center to center of the towers, and the length of the end spans 1500 feet each, making a total length, including the anchorages, of nearly 6500 feet. The towers are to be 500 feet high and will stand on masonry piers 840 by 180 feet, 25 feet high above high water, with foundations on rock. The towers will be of wrought iron and steel, containing 16 columns each. These columns are to be composed of angles and plates, all octagonal in shape and tapering from 7 feet in diameter at the base to 5 feet at the top. The columns are to be strongly braced together inside with heavy bracing and outside with lattice filling. The anchorages are to be each 320 by 180 feet and 210 feet high above high-water line. The six railroad tracks pass through a tunnel in each anchorage. The cables are to be 50 feet apart, strongly braced together to resist the deforming effects of heavy loads. Each cable will have a diameter of 4 feet. The steel wires forming the cables are to be inclosed in steel envelopes to protect them against the weather. An air space of 2 inches is to be left between the steel envelopes and the wire, for the better protection against the heating of the sun and to prevent unequal temperature effects. The designer says that in ordinary travel the proposed bridge would be strained only to about 10 per cent. of the maximum load for which it is designed.

It will be observed that the single span sustained by piers to be kept within the pier line, with a maximum height of 140 feet above ordinary high water, at once disarms all hostile objection. The one question to be determined is the feasibility of the undertaking. This settled, the approval of the Secretary of War will be only a formal act. That eventually the Hudson River will be bridged for commercial purposes as completely as is the Thames, at London, cannot be doubted. It remains to be seen to what extent it may be necessary to utilize the rocky bluffs on either side in securing the desired elevation.

Portable Rail Saw.—Messrs. Manning, Maxwell & Moore, 111 Liberty street, New York, are putting on the market a portable rail saw designed by Mr. E. C. Smith, of Brooklyn. A machine was made by Mr. Smith early in 1885 with which he cut a 60 pound rail in 35 minutes. As improved and now put on the market, it is said to be capable of cutting a 70 pound rail from 10 to 12 minutes. It will cut off a section as thin as $\frac{1}{4}$ inch, leaving the end of the rail smooth and true. Those who have used the saw speak well of it. It is operated by hand by means of two levers on opposite sides of a pivoted frame in which the saw blade is fastened. The feed is automatic. The blade is carried on pins in the frame.

The Baker Engine and Machine Company, of Geneva, Ohio, have been incorporated, with a capital stock of \$100,000.

New Beading Machine.

Manufacturers of Russia iron stove bodies and other similar articles of a cylindrical shape have experienced much difficulty heretofore in making bands of fancy embossed work, with a clear and sharp impression. The machines used for this work have not been sufficiently heavy to bring about satisfactory results. These difficulties have been completely overcome by the recent introduction of a powerful beading machine, illustrated on this page, valuable for beading, swedging and embossing sheet iron, stove bodies, stove-pipe, powder kegs and other articles of a like character. It is made by the E. W. Bliss Company, of Brooklyn, N. Y., and weighs about 800 pounds. The beading or embossing rolls are fitted on the outer

The break in the main was known to be between the banks of the river. A solution of bi-permanganate of potash was introduced at a hydrant on the side of the river nearest the reservoir, and observers were stationed on the river along the line of the main. A deep reddish purple discoloration of the river water at one point soon made the exact location of the leak apparent.

The Monitors.

One of the officers of the U. S. Steamship Boston, writing to the New York Times recently on the United States Navy, refers in the following interesting manner to the monitors:

Notwithstanding all the inventions and improvements in naval warfare during the

monitor type may still hold its own against the most powerful ordnance.

At the distance of a mile the Chief Constructor remarks that the 30 inches of side exposed subtends an angle of only 2 feet, and the turret an angle of but $\frac{1}{2}^{\circ}$. The chance of hitting this mark is, therefore, very small, and shot striking short may ricochet harmlessly over her decks. The 10-inch rifle will pierce 23 inches of wrought iron at the muzzle and 17 $\frac{1}{2}$ inches at the distance of a mile, and, as the Chief Constructor safely concludes, our present monitor may tackle the most powerful ships afloat. Their light draft and low hulls, as compared with other ships, give them a tremendous advantage, since they can lie in shoal water along our coasts, in the Chesapeake and Delaware Bays, and off our big cities, where the deep draft of ships of an enemy cannot follow, and thus keep up a destructive and harassing fire. Great speed is therefore not so vitally necessary with such a coast defender, since its light draft would enable it to choose its distance in most cases. An enemy would be compelled to send against us large, sea-going ships of high freeboard and great coal-carrying capacity, to enable them to sustain themselves for any length of time on our coast, and these ships, drawing much more water and offering a large target to shoot at, would be at a great disadvantage in fighting a monitor.

For the defense of New York no type would be more efficient. The shoals off Sandy Hook, along the Long Island shore and between the main ship channels would afford safe cruising ground for our light-draft sentinels, while torpedoes could be planted as thick as desired in the path the deep-draft enemy would be obliged to follow. There are no ships afloat to-day which carry such powerful guns with the light draft of the monitor. The Devastation, Thunderer and Dreadnaught, England's seagoing monitors of high freeboard, and all the more modern and powerful ships draw from 24 to 30 feet of water, which would compel them to maneuver with care in the vicinity of shoals.

If monitors are to be built in the future purely for coast defense their coal and provision carrying capacity could be reduced to a minimum, thus saving weight which would permit much thicker armor on turrets and sides for these floating batteries assigned for duty off our principal ports. They could run in frequently for coal and provisions at rendezvous well selected in shoal water where the enemy could not follow. To sum up, the monitor is a superb type, and by giving it a single turret the armor may be increased to 40 inches if necessary (which will defy the 100-ton gun, which pierces about 36 inches), and this with an armored turtle back but 2 feet out of water would make it practically invulnerable and a match for anything that floats.

In the City Court of Birmingham, Bammill & Co. filed a suit against H. F. De Bardeleben for \$20,000 damages. The bill of complaint alleges that the plaintiffs were residents of Belmont County, Ohio, and the owners of a boiler factory. Mr. De Bardeleben induced them to remove their plant to Bessemer, and, as the bill alleges, agreed to give them a deed to one acre of land in the Marvel City. This occurred in May, 1887, and the deed to the one acre of land has never been made, hence the suit.

The length of pipe laid in Paris for the distribution of power by compressed air already exceeds 30 miles. The compressing engines are of 3000 horse-power, and about 3,000,000 cubic feet of air are compressed daily to a pressure of 80 pounds per square inch at an expenditure of 50 tons of coal.

NEW BEADING MACHINE, BUILT BY THE E. W. BLISS COMPANY, BROOKLYN, N. Y.

ends of steel shafts, 2 $\frac{1}{2}$ inches diameter, 4 inches center to center, with bearings in the frame of the machine extending near to the rolls, thus giving a good support for heavy work. An adjustable apron gauge admits of beading work up to 14 inches from edge. An outer support for the work is provided with adjustable rolls for cylinders of different lengths and diameters, and may be removed entirely if desired. The two shafts are connected by steel-cut gears, and upon the outer end of lower shaft is mounted a cut gear 12 inches in diameter, driven by a 3-inch pinion upon a back shaft, which is also provided with a powerful friction clutch pulley, 14 inches diameter by 4-inch face. This clutch is connected with a treadle, which gives the operator complete control of its action. That part of the frame carrying the upper shaft is pivoted at the back end, the rolls being brought together by a screw and hand-wheel, and when released, strong spiral springs inside the frame separate them again.

A novel method of locating a leak in a water main was employed recently at Rochester, N. Y., with entire success.

past 20 years, the monitor is by no means an obsolete type to-day. On the contrary, it embodies many of the most essential features of a strong coast defender. The only respect in which it failed during the war, as shown by the official reports of all commanders, was in close range fighting against shore batteries and earthworks having a plunging fire and mounting a large number of guns. At long range the result was always different, and in every instance of fighting against other types of ships the monitor was uniformly victorious. Now, as the duty to which we will assign the monitor in the future will be mostly that of coast defense (fighting an attacking squadron), the one weakness developed in the past will not militate against it. The monitors were seldom pierced or permanently disabled during the war, though frequently subjected to a terrible hail of heavy projectiles. To be sure, there has been a great increase in the penetrating power of modern rifles since the war, but there has also been great improvement in methods of defensive construction, and, with thicker armor on the turrets and sides, double bottoms, and numerous water-tight compartments, our

Economy of Naphtha Engines.

As promised in a recent issue we present this week some particulars of tests of a naphtha launch engine, made a short time ago by Messrs. Paul A. Doty and Richard Beyer, at Stevens Institute, and recorded by them in their graduating thesis.

The engine upon which the experiments were made was furnished by the Gas Engine and Power Company, of New York, and was of the type illustrated and described in detail in *The Iron Age* of June 30, 1887, to which it may be interesting to refer. The engine was set up in a temporary building in the immediate vicinity of the institute building and tested several weeks. The pump which forces the liquid naphtha into the boiler is permitted to leak slightly, the liquid which escapes passing by the driving shaft, thus lubricating the bearings, and finally escaping with the exhaust vapor. As the latter is condensed and returned to the storage tank this leakage results in no loss of liquid, the only effect being the necessity of making the bore of the pump slightly larger than would be necessary if there were no leakage. But in order to test the engine it was necessary either to measure the amount of leakage or to prevent it entirely. As the latter could be more easily done the pump was changed accordingly. The dimensions of the engine are given below:

Principal dimensions of Engine and Boiler
 Number of single-acting cylinders.....3
 Diameter of cylinders, each.....3½ inches
 Stroke of piston.....4½ inches
 Piston displacement.....37¼ cubic inches
 Area of admission port.....7.32 x 2 1-16 inches
 Area of exhaust port.....5-16 x 2 1-16 inches
 Inside diameter of naphtha pump.....1¼ inches
 Stroke of naphtha pump.....1½ inches
 Travel of main valves, each.....¾ inch
 Clearance in admission port.....0.366577 cubic in.
 Clearance in indicator-pipe.....0.981750 cubic in.
 Clearance in cylinder.....0.518487 cubic in.
 Total clearance for each cylinder, 1.866814 cubic inches, or 5¼ per cent. of piston displacement.
 Floor space occupied by engine..24 x 18 inches
 Total height including stack.....6 feet
 Boiler dimensions in spiral coil:
 Height of coil.....12 inches
 Diameter of coil.....12 inches

There are seven spirals, each of four coils; inner diameter of smallest coil, 4 inches; coils are of seamless copper tubing, outside diameter of which is ½ inch. The coil is connected at its lower end to a tube leading to the naphtha pump, and at its upper end to a casting, which joins the coil to a stand-pipe. The stand-pipe is of iron, 1½ inches inside diameter, 2 feet long. The burner has 26 openings, each ⅜ inch in diameter.

Six indicator cards were taken from each cylinder with a 40 spring at as nearly uniform pressure as was practicable. It will be observed that in the first and second cylinders there is considerable initial expansion, while in the third the initial pressure is maintained with marked uniformity up to the point of cut-off, which was at half stroke. In all of them the drop at release is very abrupt, the pressure falling at once to very nearly that of the atmosphere. The back-pressure is uniform and small, and the compression line is good. The difference between the cards in the first and second engine and the third one appeared to be due to the working of the valve, although there was not time to examine into the cause.

Results.

The total horse-power developed from the three cylinders was:

	Horse-power.
First cylinder	0.9178
Second cylinder	0.9176
Third cylinder	0.9710

Total.....2.8064

The amount of naphtha burned in one hour was 9.89 pounds, and the amount of naphtha per horse-power per hour, 3.53 pounds. The market price of naphtha, June

5th, 1888, the date of the test, being 10 cents per gallon, the cost per horse-power per hour was 6.20 cents. The average number of revolutions per minute was 280.7. The number of cubic feet of water per horse-power per hour used to condense the exhaust naphtha was 135.27. The temperature in the smoke-stack was about 600° F. It was attempted to develop a higher horse-power, but when run at a much greater speed the engines did not work properly. It was inferred that the valves ought to have more lead, or else the pump should be larger, or both these conditions should exist in order to develop the higher horse-power, but the time at the disposal of Messrs. Doty and Beyer unfortunately was too limited to enable them to investigate these points.

Three sets of experiments were made to determine the relation between the press-

point does not appear to be a fixed quantity, owing to the complex chemical composition of the naphtha. In a continuous experiment, extending for one hour, the temperature at boiling rose from 140° F. to 155° F., the mean of which is 148° F. nearly. Under these circumstances the result, 142° F., found by the formula is as good as can be expected.

To find the latent heat of evaporation the exhaust vapor was condensed under atmospheric pressure by passing it through a surface condenser kept cool by a stream of water, whose initial and final temperatures were measured. It was found that the number of pounds of water passing through the condenser per hour was 25594.25. The increase in temperature of this water was 3.9° F., and the number of pounds of naphtha passing through the condenser per hour were 421.28. From

Fig. 1.—Diagrams from First Cylinder.—40 Spring.

INDICATOR CARDS FROM A NAPHTHA LAUNCH ENGINE.

ure and corresponding temperature of the saturated vapor of naphtha. These experiments gave:

At 60 lbs. pressure.....	258° F.
" 47 "	242° F.
" 35 "	235° F.

which substituted in Rankine's formula (Wood's Thermodynamics, p. 67),

$$\text{com. log. } p = A - \frac{B}{\tau} - \frac{C}{\tau^2},$$

gives, for the continuous relation between the pressure per square foot and the absolute temperature:

$$\text{com. log. } p = 6.47 - \frac{890}{\tau} - \frac{625750}{\tau^2}$$

As a partial test of the correctness of this formula Messrs. Doty and Beyer computed from it the temperature of the vapor for a pressure of one atmosphere, or $p = 2116.2$ pounds, finding $\tau = 602^\circ$ F. absolute, $T = 142^\circ$ F. above the zero of the Fahrenheit scale. An independent test was made in the laboratory to determine the boiling point directly. The boiling

this they deduce $25594.25 \times 3.9^\circ = 99817.575$ heat units; $99817.575 \div 421.28 = 236.94$ as the latent heat of evaporation at atmospheric pressure.

Volume of Vapor.

From equation (84), p. 98 of Wood's Thermodynamics, they have for the volume of 1 pound of the saturated vapor:

$$V_2 - V_1 = \frac{He}{\tau \frac{dp}{d\tau}} = \frac{He}{p \left(\frac{B}{\tau} + \frac{2C}{\tau^2} \right) \times 2.3026}$$

which for naphtha vapor becomes

$$V_2 - V_1 = \frac{236.94 \times 778}{24035.5} = 7.669 \text{ cubic feet.}$$

The volume of 1 pound of naphtha at 60° F. = 0.0284 cubic feet; therefore, $V_2 = 7.669 - 0.0284 = 7.6406$ cubic feet.

The number of pounds per cubic foot is $24085.5 \div 184339.32 = 0.1304$ pounds.

One pound of naphtha vapor at atmospheric pressure occupies $7.689 \div .0234 =$

using oil for fuel. The building is so large that an enormous stock of coal would have to be constantly carried to meet its requirements, while oil can be stored a.

flammable contents could be incurred. A cleaner and more controllable fuel than coal will also be obtained in this way, which is an important consideration in the minds of the builders of the Auditorium.

The Cruiser Charleston.

The first of the new cruisers laid down by the present Navy Department was launched last week from the Union Iron Works, San Francisco. The Charleston is a twin-screw cruiser of 3730 tons, built of steel throughout, having a length between perpendiculars of 300 feet, a beam of 46, a draft forward of $17\frac{1}{4}$ feet, and a draft aft of $19\frac{1}{4}$. She is double-bottomed under engines and boilers. She has also a curved or turtle-back steel deck from two to three inches thick running from stem to stern, and protecting everything below it, being a foot above load-water line at the crown and then sloping at its edges to four feet below the water. Coal bunkers are so arranged as to furnish further protection. The compound engines are in two separate compartments, and actuate 8-bladed twin-screws. The indicated horse-power under forced draft is 7500, and she is expected to make a maximum of fully 18 knots an hour. At 10 knots an hour her coal will last for 8600 miles, and at 8 knots for 11,000. She has no sail power, however, except storm sails, but has two military masts. Her regular coal capacity is 450 tons, but she can carry 800, with an increase then of $1\frac{1}{4}$ feet in her draft. Her hold is divided into many water-tight compartments by bulkheads, furnishing room for stores, ammunition, chains, and so on. The main battery consists of two high-power breech-loading, 10-inch steel rifles, mounted on central pivots, besides six 6-inch rifled breech-loaders. The secondary battery of the Charleston will consist of rapid-fire Hotchkiss guns and Gatlings, and she will also have a supply of automobile torpedoes, to be launched from tubes mounted above water in broadside.

The Molders' Union.—At the Iron Molders' National Convention which was held in St. Louis recently, it was reported officially that in 1886 and 1887 there had been 22 disagreements between employers and union molders over wages and hours of labor. Of these 12 cases were settled on terms favorable to the molders, 7 were defeats, 1 is still unsettled and 2 continue in active progress. The most notable defeat was suffered in the strike which began in March, 1887, at the stove works of the Bridge and Beach Mfg. Company, of St. Louis. The National Association aided the strikers for the following half year and then withdrew from the contest. It cost Union No. 10 alone the sum of \$23,348.40, and built up the Manufacturers' Defense Association in powerful opposition to the workingmen's organization. The strike fund was reported at the recent session to have received during the past year \$36,068.93, and to have disbursed \$33,833.54 among 18 unions, leaving \$2,235.39 on hand. There was a net increase of 3571 members in the year.

According to Prof. R. H. Thurston, there are three great chances left for inventors—viz., the production of electricity directly from the combustion of coal or similar fuel; secondly, the production of light without heat, as in the case of the light of the firefly and that of the glow-worm; and, thirdly, the production of a successful air ship.

The Blake and Blenheim, two of the latest English cruisers, have been designed for speeds of 22 knots per hour.

INDICATOR CARDS FROM A NAPHTHA LAUNCH ENGINE.

827.78 times the volume of 1 pound of naphtha at 60° F., while steam occupies about 1660 times its volume as water.

The great Auditorium building in Chicago is being fitted up with a view to

long distance from the building and piped in gradually as it is consumed. The tanks for storing the oil supply will be located on the lake front outside of the tracks of the Illinois Central Railroad, and so far away that no possible risk from their in-

Recent Customs Decisions.

DUTIES ON THIN SHEETS OF STEEL.

The Secretary of the Treasury has revoked a former decision that certain so-called "black taggers" iron was dutiable at the rates for steel in sheets, having reached the following conclusions upon the questions involved:

Schedule C (T. I., 151) provides that "all iron commercially known as common or black taggers iron, whether put up in boxes or bundles, or not," shall pay a duty of 30 per cent. ad valorem. This paragraph also expressly includes various kinds of plate and sheet iron, and closes with a proviso "that on all such iron and steel sheets or plates aforesaid, excepting, &c., when galvanized or coated with zinc or spelter or other metals, or any alloy of those metals, $\frac{1}{2}$ cent per pound additional."

"Taggers iron" was first mentioned *eo nomine* in the act of August 30, 1842, but does not seem to have been specially designated in subsequent tariff laws until the passage of the act of June 30, 1864, but during the period intervening between 1846 and 1864 was probably classified for duty under the provision in the various tariff laws for sheet iron, common or black, &c. Since 1864 it has paid duty at the rate of 30 per cent. ad valorem, it being specially enumerated.

The proofs show that during all this period, and down to the passage of this act of March 3, 1883, merchandise having substantially the same qualities, and produced by the same process of manufacture as the articles described in these importations, was commercially known as "taggers iron," or "black taggers," and was classified for duty under the provisions of law above referred to. Such classification continued after the passage of the act of 1883, until in January last, when it was insisted by the revenue officers that this merchandise was not iron or a manufacture of iron, but was steel or a manufacture of steel, and should be classified under paragraph 177, which imposes a duty upon steel bands, hoops, and sheets of all gauges and widths valued at 4 cents a pound or less, at the rate of 45 per cent. ad valorem, and if cold-rolled, &c., $\frac{1}{2}$ cent per pound in addition, and duty was levied accordingly; and it was in one of these cases that the decision of the Department was made.

It will be perceived from an examination of this decision that among other things it was based upon a report from the appraiser at New York stating "that brands identical with those covered by the entries in question have been invariably classified at that port as steel," &c. This proves to be an incorrect statement of the contents of the report in this respect, as the report merely stated that it was the practice at that port to classify such merchandise as steel, but that it had been invariably so classified at that port was an inference of the Department, and not a fact stated by the appraiser. A further report from the appraiser at New York was called for in these cases, from which it appears that for a period of 20 years or more it has been the invariable practice at that port to classify such merchandise as "taggers iron," and to assess duty accordingly. The same fact is also conclusively established by the papers submitted by the appellants, and the further fact that during all this period it was commercially known as "taggers iron," and bought and sold in the market as such.

Affidavits of the manufacturers are also submitted, from which it is, I think, satisfactorily made to appear that the article is in fact iron or a manufacture of that material, and not steel or a manufacture of steel. The only evidence tending to show that it is a manufacture of steel is

the report of the chemists who have made the analyses or tests of the metal, which is to the effect that it is a low grade of steel. Whatever the fact may be in this respect, I cannot doubt, from an examination of paragraph 151 and subsequent paragraphs, that it was the intention of Congress to subject it to duty according to its well-known commercial designation. Such seems to be the express language of paragraph 151, and the proviso also contemplates that some of the articles specified in the paragraph might also possess the properties of steel, for it declares "that on all such iron and steel sheets or plates aforesaid" an additional duty might in certain cases be imposed. So in paragraph 153 "iron or steel sheets or plates, or taggers iron," seemed to be regarded as convertible terms. The said decision, having been made upon an erroneous view of the facts in the case, is hereby revoked, and the claim of the appellants, which is that the merchandise is dutiable at the rate of 30 per cent. ad valorem, under the provisions in said schedule for "all iron commercially known as common or black taggers iron, whether put up in boxes or bundles, or not," is hereby sustained. The collector is instructed to reliquidate the entry accordingly, and to take the necessary steps for the repayment of the duties erroneously exacted.

DUTY ON POLISHED PLATE ZINC.

On an appeal from an assessment of duty at the rate of 45 per cent. on "zinc or tutenag in sheets nickel-plated," claiming that the merchandise is dutiable at 2 $\frac{1}{2}$ cents per pound, as zinc or tutenag in sheets, or at no more than 35 per cent. ad valorem, as plated articles, and returned by the appraiser as a manufacture of zinc, the Secretary of the Treasury says: "From the special report of the appraiser it appears that the merchandise in question consists of sheets of zinc not nickel-plated, which are specially manufactured for printing purposes, and are stamped 'polished plate for transfer or pen work,' that these sheets are cut in the forms and of the sizes to suit the special purposes for which they are designed, and that they are not the 'sheet zinc' of commerce. It also appears that these sheets have the surface of one side deadened by the apparent use of an acid, while the surface of the opposite side has been highly polished by friction. These articles are, therefore, manufactures, and, being of zinc and not otherwise specially enumerated or provided for, are dutiable at the rate assessed."

Among the papers just published by the American Institute of Mining Engineers, is one by Frank C. Roberts, of Philadelphia, on calculations of the available heat and the required dimensions of chimneys, combustion-chambers and gas burners in the use of blast-furnace gases for firing boilers.

Judge Wheeler, in the United States Circuit Court, has rendered a decision in favor of the city in the important suit of Campbell vs. the Mayor, &c., of New York. The claim was for the infringement of the patent of James Knibbs for a relief valve for steam fire-engines granted in May, 1864, and the amount involved was upward of \$2,500,000. The suit was commenced in 1877. Testimony was taken for four years, and the suit was first heard in 1881 by Judge Wheeler, who held the patent valid and infringed by the city fire-engines, and decided in favor of the complainant. A reference was then ordered to a master to compute the amount due from the city, and this reference has been continued for some years to the present time. The Court has now reversed its former decision, and holds that the patent is invalid, be-

cause the invention is proved to have been in public use for more than two years prior to the application.

Employers' Liability in Massachusetts.

Western Massachusetts, if not the entire State, has had for the past week the trial of the first cause under what is known as the Employers' Liability act, passed in 1877, in four cases tried together against the Hudson Iron Company. October 15 last Patrick Myers, Michael Flynn, Michael Kane and John Fallon, all employees of the Hudson Iron Company, while being lowered into the mine in the morning in a bucket commonly used for that purpose, and also for hoisting ore, received injuries which rendered one of the plaintiffs crippled for life, and the others were also badly injured. By some means the hoisting machinery was out of order, and when 50 feet from the top of the shaft it gave way and the four men fell a distance of 125 feet in the bucket to the bottom of the shaft. Myers brought suit for \$10,000 and the other three for \$5000 each against the Hudson Iron Company, a wealthy corporation, whose furnaces are at Hudson, N. Y., but whose mines are at West Stockbridge, just over the line in Massachusetts. The case was begun before Chief Justice Brigham, of the Superior Court, last week, and was concluded in a disagreement of the jury.

The plaintiffs claimed that under the new Employers' Liability act defendants were guilty of gross carelessness in not providing proper machinery; that it was old and had been frequently broken, and that the brake bar regulating the speed of the bucket going down into the mine had become so weakened that it could not hold a load of four men; that the horns of the friction-clutch operating drum had become beveled, and when they were applied to the rapidly descending bucket did not hold; also that the company did not employ a competent engineer at that time to manipulate the machine; that oil and water had been allowed to accumulate on the drum-head so that the brake would not hold. On the other hand the defendants set up that the men could go either by bucket or a chute in another part of the mine, and that going by bucket was their option, and that they did not exercise due care, and thereby contributed to negligence. Scores of witnesses, many of them expert machinists, were examined, and it appeared in evidence that shovelers, like the plaintiffs, were allowed no discretion, but had to go by the bucket, while the miners went by chutes.

The case has attracted a good deal of attention, especially as the Knights of Labor have furnished money for the prosecution of the company as a test case, while, on the other hand, many manufacturers and others have attended court in order to see what decision would be reached, as it might affect their own mills. Chief-Justice Brigham held that if the defendants had furnished an ordinarily safe machine that they had discharged their duty, especially if the plaintiffs had the option to go by the bucket rather than the chute. The jury deliberated nine hours and stood nine for a verdict and three against. The latter held that there was an option afforded plaintiffs to get to the mine, and that from a personal view of the premises by the jury when the trial began the machine that was capable of raising and lowering 700 pounds of ore was capable of carrying safely four ordinary sized men. Senator Dawes was of counsel for defense. Additional interest now attaches to the case from the fact that no decision has been reached, and that there will now be a delay of new trial before the question can be decided.

THE WEEK.

The directory "booms" of many prosperous and ambitious American cities are under full headway now. The little city of Portland, Ore., shows an increase of 1650 names over last year's directory and ten larger cities make the following gains in the number of names: Milwaukee, 5286; Atlanta, 5809; Denver, 5866; Kansas City, 6373; St. Louis, 6984; Omaha, 8135; Brooklyn, 8256; Baltimore, 9488; Minneapolis, 15,069, and Chicago, 16,675. The most remarkable figures are those from Baltimore and Minneapolis. There will be at least 30 cities in the United States in 1890, instead of 20, as in 1880, which will show a population of more than 100,000, and the number may reach 35.

The River and Harbor Bill, appropriating over \$22,000,000, the largest amount ever voted by Congress in that direction, now awaits the President's signature. The Conference Committee struck out the item of \$500,000 for the purchase of the Portage Lake Canal, Mich., but the items providing for surveys of the Hennepin Canal and the proposed canal between the Illinois River and Lake Michigan are retained on the condition that the Government be not considered committed to either of the schemes.

The sugar trade is badly demoralized by Trust operations and the corner of the raw product produced by their chief antagonist, Claus Spreckles. The whole sale grocers suddenly found their supplies seriously reduced, and the Trust was unprepared to meet the emergency both as to supply of raw material and refining capacity. Not only are refineries from one to two weeks behind in their deliveries, but for the most part they have declined to take orders except to book them at prices to be fixed for them on delivery. As a consequence the jobber has been forced to sell sugar at such a close margin of profit that there scarcely rests any motive for doing business. The jobbers gross profit on assorted grades is about 7 per cent. It costs him 6 per cent. to handle the goods, leaving him 1 per cent. net.

The total exports of petroleum and other mineral oils from the United States for the fiscal year ending June 30, 1888, amounted to 554,901,395 gallons, valued at \$45,150,708, compared with 576,094,849 gallons, valued at \$45,423,474, for the previous year. This is a decrease of 21,193,454 in gallons and \$272,766 in value. The following ports, which ship about 99 per cent. of the total exports, shipped amounts during the past two years as follows:

	1888. Gallons.	1887. Gallons.
New York.....	394,180,131	400,488,533
Philadelphia.....	146,671,617	156,519,944
Baltimore.....	8,684,648	12,428,145
Boston.....	5,364,999	6,658,227
Total.....	554,901,395	576,094,849

Of the \$8,000,000 invested in the pottery industry in this country \$4,000,000 is centered in Trenton, N. J. There are 26 potteries there. They give employment to about 5000 persons, who receive weekly in wages about \$50,000 when the potteries are running. A fine earthenware dinner set, decorated with flowers, gold edge, and so forth, can be purchased now from the American potteries for \$25. The same thing would have cost from an English pottery before 1878 \$45.

The subject of Australian trade is receiving special attention on the Pacific Coast on account of the Melbourne International Exhibition, as the Californians are anxious to secure the largest share pos-

sible. A San Francisco paper, looking at the statistics of the trade with the United States during the last two years, says: They show that our imports from the colonies increased to the extent of \$1,500,000 within a year, while our exports to the colonies decreased to about the same extent. The figures are as follows, and are for the fiscal year ending June 30:

Year.	Imports.	Exports.
1886.....	\$3,859,360	\$11,134,301
1887.....	4,411,119	9,668,435

This shows a considerable loss in our export trade, which is pretty evenly divided in proportion to its extent between Pacific Coast and Eastern points, thus:

	Exports. 1886.	1887.
Pacific Coast.....	\$2,150,046	\$1,731,675
Eastern points.....	8,984,255	7,936,760
Total.....	\$11,134,301	\$9,668,435

In the matter of imports, however, the Pacific Coast shows an increase of \$814,000 in the course of a year, while in the East the imports decreased to the extent of \$262,000 in the same year.

Dr. H. N. Allen, secretary of the Korean Legation to the United States, speaks of the growing intimacy between the two countries, whose relations are closer than those with any other. He is now in New York arranging direct telegraphic communication. California will probably be granted concessions to work the gold mines, which are believed to be very rich. American officers are reorganizing the Korean army and will introduce American weapons. A contract has been made with a firm in the United States for the exportation of 50,000 tons of rice.

Oscar S. Straus, United States Minister to Constantinople, who is about to return on a temporary leave of absence, reports that the relations existing between the two countries are of the most friendly character.

Wealthy Chinamen are obtaining subscriptions for a Chinese Exchange to be erected in Mott street, New York City, to be the headquarters for all Chinamen east of the Rocky Mountains.

There is now on the stocks at Waldoboro, Me., one of the most remarkable vessels ever built in the United States—a five-masted center-board schooner, which will be the largest vessel of its kind afloat. Her length of keel is 225 feet, her breadth is 50 feet, depth of hold, 21 feet, and her measurement will be 1800 tons. Her masts will be of Oregon pine, and her foremast, mainmast, mizzenmast, spankermast and jigger will be each 115 feet in length. There will be used in her construction 450 tons of white oak from Virginia, 800,000 feet of hard pine from Georgia, and 175 to 200 tons of iron. Her outboard planking will be 6 inches thick from keel to top, and her inside ceiling will be from 10 to 14 inches in thickness. She will have two full decks running the entire length of the vessel and nine hatches. She will be launched in October. She will be employed in the coal trade.

The work of regilding the copper dome of the State House, in Boston, has been commenced and will be completed in six weeks. It was originally gilded about 14 years ago. The dome is 35 feet high and 53 feet in diameter. The whole is enclosed in a cage of lumber, to serve as a framework for a canvas covering, for the protection of the gilders. The copper surface will be polished to the smoothness of glass, and then given a coating of size, over which will be a layer of yellow paint. The sizing will be composed of the best varnish, turpentine and the oldest pure linseed oil, and when this has partially set the surface is ready for the gilders. Two

hundred and forty packs of 23-carat gold-leaf will be required. Each book is worth \$4.70.

Col. Longendycke has been in the cattle business in Kansas and the Southwest for many years, and he believes that the days of the ranchmen in this country are numbered. He further believes that South America offers a fine field for the cattle industry, and that from the grassy plains of Brazil and the Argentine Republic must come the cheap beef of the future. With that in view he has formed an association who propose to secure a large tract of grazing lands in the Amazon Valley and export beef from Brazil for consumption in the United States.

One of the principal iron steamship builders in Philadelphia has in course of construction nine steamships, including those contracted for by the Government.

The Senate confirmed the nomination of Melville W. Fuller to be Chief Justice of the United States Supreme Court, by a vote of 41 to 20.

The population of California at the present time is officially stated to be over 1,500,000, almost doubling that of 1880.

Nearly 1000 houses in Port-au-Prince were destroyed by an incendiary fire which broke out in the Senate Building, July 4. On account of fears of a rebellion of the political factions valuable merchandise has been placed in fire-proof buildings so far as practicable. The best part of the city is in ashes.

The population of Washington city is 218,000, including 72,500 colored.

Orange culture in Louisiana is making good progress. A single parish this year will yield oranges to the value of \$170,000, or almost as much as the entire State eight years ago.

An appalling cloud-burst last Thursday in Western Virginia swept bare 100 square miles of agricultural country and at Wheeling several lives were lost. Nine railroad bridges and 25 wagon bridges are gone in Ohio County alone, and a low estimate puts the loss \$350,000. In Belmont County, Ohio, the loss will aggregate \$100,000.

The Pithole farm in the Pennsylvania oil regions once sold for \$1,500,000, but for 20 years has produced nothing. A few days ago, however, wells there began to yield 150 barrels a day and once more territory lately regarded as worthless is in demand.

The Cuban sugar crop promises a large yield.

The Industrial Home and School of St. Francis de Sales, near Bristol, Pa., founded by the daughters of the late Francis A. Drexel, was opened last week with 200 boys. The value of the property is \$200,000, and the generous founders have provided for the current expenses of the institution. Manual training will be its great feature.

Representatives of three-fourths of all the nut and bolt manufactories in the United States met at the Fifth Avenue Hotel last week and arranged the preliminaries for an association of all the manufacturers in this country to maintain prices and prevent disastrous competition and overproduction. Eighteen persons were present, representing over 30 of the 45 factories now in operation. It was determined that an organization of the character proposed should be effected if a sufficient number of those not represented in the meeting would co-operate to give the association the necessary strength. A committee was appointed to draft the form of an agreement for the signature of the members at the next meeting. By the agreement

special discounts are to be given to dealers handling exclusively the goods of the association factories, and all the members of the association bind themselves by strict penalties not to sell their goods below the association schedule. The product of the nut and bolt manufactories of the United States amounts annually to several million dollars. It has of late years increased beyond the legitimate demands of the trade. Competition in price has naturally diminished the profits of the contending manufacturers, hence this organization.

The contract labor law is practically a nullity. So far as it has any efficacy skilled labor is excluded, while the padrone and his counterparts of various nationalities meet with little impediment. The immigrant who comes with some definite knowledge of what he is to do to earn a living, and with some assurance of employment, is the most welcome, certainly, and yet it is against him that this law necessarily operates. Chairman Melbourne H. Ford of the Congressional Committee to investigate the violation of the laws bearing on immigration is taking testimony, and will in all probability occupy two or three weeks at the least in this city.

The Connellsville coke operators have shipped 8000 tons of coke to Newfound-land and expect to show that it is superior to the English product.

The Board of Water Commissioners of the village of Sing Sing awarded the following contracts for the construction of the new waterworks there: Gloucester Iron Company, Philadelphia, pipe and special castings, \$38,261; R. D. Wood & Co., Philadelphia, hydrants and valves, \$4244, and other contracts for reservoirs, &c., amounting to \$113,344. The sum of \$150,000 has been appropriated, and the contract for the pump, engine and boiler is yet to be given out.

Five ships are on their way to Tacoma, W. T., from Japan, with 12,000,000 pounds of tea, to be shipped East over the Northern Pacific Railroad. The first of the fleet has already arrived and the American company doubtless feels that it has scored a good point against the Canadian Pacific.

Traffic on the Erie Canal is the lightest experienced in July for three years. The loss is principally in the transportation of grain and lumber. Freight rates, too, are extremely low, while last year vessels were profitably employed the entire season.

The State Forest Commission last week summarily disposed of the 200 "custodians" that it received as a legacy from the Land Commission when the Forest Commissioners were appointed about two years ago. At the meeting of the board in this city, President Sherman W. Knerals presiding, the decision was to the effect that these custodians had never been legally appointed, and all their supposed rights were revoked. Unless the custodians contest their removal in the courts, some 200 cottages and villas in the Adirondack and Catskill Mountains will revert to the State, and their owners will have to find other sequestered nooks upon land not belonging to all the people in general and no one in particular.

The machinery of the great silk mill of the Phoenix Mfg. Company, in Pottsville, Pa., was started last week. The mill has been one year in construction, and is said to be the most extensive and completely equipped establishment of the kind in the country.

Naval officials are very much pleased over the successful casting of the stern post of the cruiser Charleston at the Pacific Rolling Mills, which is shown to have been an exceptionally fine, extra

smooth, sound casting of open-hearth steel. The weight of the charge placed in the furnace was 27,295 pounds of metal, and the dressed casting weighed 11,510 pounds. Test pieces taken from this casting gave an elastic limit of 33,742 pounds per square inch, a tensile strength of 63,112 pounds per square inch, 18 per cent. elongation in 8 inches and 20 per cent. reduction of area. Bending test pieces were bent cold over radii varying from $\frac{1}{4}$ inch to $1\frac{1}{4}$ inches through angles varying from 218° to 234° without fracture.

A statement, prepared at the Patent office, shows that during the six months ended June 30, there were 18,685 applications for patents and 1298 caveats filled. During the same time 10,855 patents and reissues were granted. The receipts of the office were \$568,091. In each of these items there is an increase over the same months of last year.

The Erie Railroad have adopted the same system as that in use by the Pennsylvania at their Jersey City terminus for protection against fire. They have 28 boxes in all, located at important points and covering all places controlled by them. A land force and fire-tug force have been established, with full instructions how to act in case of fire, each force having a chief and assistant chief.

The Detroit city hall was badly wrecked a few days ago by an explosion, which investigation proves to have been caused by a leakage of gas.

The report of the Secretary of the Prison Reform Association shows that the proportion of prisoners to the total population of the country has increased rapidly. In 1850 the census showed a percentage of 0.29, but in 1860 of 0.607. The percentage of foreign-born prisoners as compared with that of natives is now a little less than double. In 1850 it was more than five times that of native prisoners. In other words, the increase of crime has been greater among the native population than the foreign. Foreign disregard for law shows itself far more in immorality and disorder than it does in dishonesty or violence.

The Russian Consul at Nagasaki calls attention to the excellent opportunities for the introduction of Russian oil into Japan. He asserts that Russian kerosene is both cheaper and better than the American, and ascribes it to the want of enterprise of Russian merchants that this important article has not been widely spread all through Japan.

Another steel bridge will be built across the Allegheny River in Pittsburgh, for the electric lines of cars. The capital to be invested is \$500,000.

The Eclipse Mfg. Company.

The new works occupied by the Eclipse Mfg. Company in the manufacture of steam and hot-water radiators are located in the southwestern part of Chicago, on Twenty-second street, near Western avenue. These works were built by the company with a special view to their purposes, and form a very compact and well-arranged plant. One building, 60 x 256 feet, built of brick, shelters the whole working force. The front, to a depth of 130 feet, is occupied by the machine shop, with a portion at one side partitioned off for a shipping room and a small space in a corner on the other side for an office. In the rear of the machine shop is a room for cleaning castings, which extends the full width of the building. The foundry, 60 x 125 feet, occupies the remaining space and is open to the roof. The machine shop has a basement under it and the pattern shop

overhead in a second story. The building is constructed of brick and is supplied with numerous windows, the foundry being particularly well lighted from the sides and from windows in the ventilator, which extends along the comb of the roof.

As the output of the foundry consists of radiator loops and other hollow castings, an unusual number of core-makers is employed for the quantity of work performed. Over one-fourth of the 45 hands employed in this department are core-makers. The capacity of the foundry is now 400 to 500 radiator loops per day, with one 10-ton cupola. The metal is tapped from the cupola directly into casting ladles, which are carried at once to the flasks, in order to keep it as hot and liquid as possible. The melting of metal and heating of cores are done exclusively with coke.

The machine shop is equipped with lathes and with special tools for finishing and connecting the loops. After the loops are cast and cleaned the first process is to test them with water to see that they are free from holes. They are then taken to a machine and tapped. A special machine faces the upper ends of the hot-water loops, another dresses the ends to go together, another cuts the nipples, &c. A very interesting machine is used to screw the loops together, which it does more perfectly and economically than could be done by any hand process. These special machines were all built by the company except a very few, which were built elsewhere for lack of time. After the loops have been joined they are tested with water-pressure at 65 pounds to the square inch, and with steam from the boiler furnishing power to the engine, which ranges from 60 to 70 pounds. The radiators are shipped in the rough to their destination, the painting and decorating being done to best advantage after they are set in position to be used. In the machine shop and other departments outside of the foundry about 50 men are regularly employed.

The products of the company, in addition to steam and hot-water radiators, are steam traps, back-pressure valves, purifying valves for purifying water going into boilers, rocking-grate bars, and pressure regulators or reducing valves. The Eclipse back-pressure valve is an automatic device placed on the exhaust-pipe of a steam engine, so that the exhaust steam, which would otherwise be wasted, may be utilized for heating the building, &c., and the valve is so constructed that any surplus quantity of exhaust steam passes off through it into the atmosphere without noise and without the rapid wear usual to such devices. The Eclipse pressure regulator is adapted for use in heating apparatus or manufacturing when a constant, unvarying pressure below 10 pounds is required, notwithstanding the variations above this pressure that may take place in the boiler. New and improved forms of radiators are also being made by the company, embodying ornamental designs and securing greater efficiency.

The location of the works is excellent for gathering together materials, shipping goods, and expanding when greater facilities are required. A siding runs into the yard from the Chicago, Burlington and Quincy Railroad. A number of adjoining vacant lots are owned by the company, and additional buildings are contemplated, as orders are at present in excess of their capacity. A second cupola has already been decided upon, as ample room was left for it in the construction of the foundry. Gas for illuminating purposes is manufactured on the ground from gasoline, which is found to be economical and wholly satisfactory in every respect. The city office of the company is located in the Rookery Building, room 418, in which specimens of their products are exhibited.

MANUFACTURING.

Iron and Steel.

We are informed that the report that the Standard Iron Company, of Bridgeport, Ohio, whose works have been idle for some time, would sign the scale and resume operations on the 23d inst., is without foundation. The company have not as yet decided when they will resume operations again.

The Reeves Iron Company, of Canal Dover, Ohio, are constructing a regenerative gas furnace, with the necessary gas producers, from plans furnished by Alex. Laughlin & Co., engineers, of Cleveland, Ohio, and upon its completion intend erecting another furnace immediately, for their 8-inch mill.

The plant of the Warren Tube Company, at Warren, Ohio, is advertised to be sold by the Sheriff on the 14th of August next. The appraised value of the plant is \$115,000.

The Sharon Iron Company, of Sharon, Pa., signed the Amalgamated scale last week and their plant has resumed operations in all departments.

Negotiations are pending with persons who desire to lease the new charcoal furnace of the Decatur Land, Improvement and Furnace Company, at Decatur, Ala., which is now nearly finished.

J. W. Walker, proprietor of the Shiffler Bridge Works, at Pittsburgh, Pa., reports a large amount of business on hand at present. In the matter of mill buildings and steel plants, he is now engaged on a contract with H. Disston & Sons, the well-known saw manufacturers, of Philadelphia, to replace the buildings of that firm recently burned, which cover over 60,000 square feet of ground. He is also erecting, for the Allegheny Bessemer Steel Company, at Duquesne, Pa., a main building constructed entirely of wrought iron and covering about 40,000 square feet, and an iron building to be used as a cast-house for the Attala Furnace Company, of Attala, and several other smaller structures. In addition to these Mr. Walker has a large amount of bridge work for various railroads throughout the country, among which may be named Baltimore and Ohio, Pennsylvania Railroad and Pennsylvania Company's lines West of Pittsburgh, East Tennessee, Virginia and Georgia, Kanawha and Ohio, Chattanooga, Rome and Columbus, Oxford and Clarksville railroads.

A special dispatch from Warren, Ohio, under date of the 20th inst., reads as follows: "In 1883, when James Ward failed in the iron business at Niles, he owed his men \$15,000, and it was not thought possible that more than 50 per cent. of this could ever be paid. John M. Stull, of this city, was made assignee, and, by judicious handling of the property, he has been able to pay the debt in full, the men receiving the last dollar due them to-day."

The Catocin coke furnace was expected to be blown in about July 28. The property will be under the control of Thomas Gorsuch, as agent, until the new company are organized and a charter obtained.

The Bellaire Nail Works, of Bellaire, Ohio, are making some extensive additions to their plant. The steel department will be almost reconstructed throughout, and will not be ready to resume operations for several weeks yet. Among other improvements two new switches are being laid, making eight in all, which will be covered by a building 810 x 150 feet, covering over 1 acre under roof, and accommodating 32 cars at once. The necessity for this extensive dumping ground will be realized

when it is known that 18 cars of ore and 16 cars of coke are unloaded at the works every day. The blast furnace of this company is still doing remarkable work. For the six months ending on June 30 its output was 26,540 tons.

Charles Huston & Sons, proprietors of the Lukens Rolling Mills, at Coatesville, Pa., have just put in a new set of three-high rolls, 98 x 30, in place of 84 x 25, as heretofore. They also put a new cylinder of increased size, with Corliss valve-gear, to their engine, which was formerly of the slide-valve pattern. All the work is now complete and running satisfactorily. Orders are reported plenty.

Col. James Collord, of Collord & McKee, pig-iron brokers, of Pittsburgh, and John J. Spearman, of Sharon, Pa., have leased the Sharon furnace of Boyce, Rawle & Co. at that place, and will put it in first-class repair, with the intention of early resumption. They have an option on the purchase of the plant at a reasonable figure. The furnace has been idle nearly a year.

The rail-mill department of the Cleveland Rolling Mill Company, of Cleveland, Ohio, is running double time at present.

The rolling mills of the Oxford Iron Company, at Belvidere, N. J., resumed operations on Thursday. Harmony exists between employers and employees. The works have been closed for several weeks.

D. W. C. Carroll & Co., Limited, of the Fort Pitt Boiler Works, Pittsburgh, have just received an order for four 35,000-barrel oil tanks, six 600-barrel oil stills and three large tubular steel boilers, complete, all to be completed in 120 days.

The two Cedar Point furnaces of the Baltimore Iron Company, at Baltimore, Md., have been dismantled. The wharf property has been sold to the Philadelphia, Wilmington and Baltimore Railroad Company.

P. L. Kimberly & Co., Limited, of Sharon, Pa., signed the Amalgamated scale for the Atlantic Iron and Nail Works, at that place, and these works resumed operations in full in all but the nail department on Monday, the 23d inst. The plant has been idle since March last. Keel Ridge Furnace, also at the above-named place, and operated by this firm, will be put in blast at an early date. It has been idle since the first of the year.

About 300 employees of the Lake Erie Iron Company, of Cleveland, Ohio, have stopped work owing to the establishment of the monthly pay system. The men were employed in the nut and bolt department and but recently received notice of the monthly pay system. They were invited to sign an agreement to that effect, but refused and struck. It is thought that the trouble will be satisfactorily arranged in a few days.

The Ivanhoe Furnace, in Wythe County, Va., is expected to be ready to blow in with coke as fuel about October, 1888. It is being remodeled for this purpose, having heretofore been a charcoal stack.

The regular monthly meeting of the Western Wire Nail Association, which is composed of the wire nail manufacturers west of the mountains, was held in the Monongahela House, Pittsburgh, on Friday, the 20th inst. C. B. Beach, of Cleveland, is president, and R. H. Johnson, of New York City, officiated as secretary. The following named firms were represented in person: Pittsburgh Wire Nail Company, Pittsburgh, Pa.; Hartman Steel Company, Limited, Pittsburgh, Pa.; New Castle Wire Nail Company, New Castle, Pa.; Phillips, Townsend & Co., Philadelphia, Pa.; Salem Wire Nail Company, Salem, Ohio; H. P. Nail Company, Cleveland, Ohio; American Wire Nail Com-

pany, Covington, Ky.; Cincinnati Wire Nail Company, Cincinnati, Ohio; Wetherald Wire Nail Company, Findlay, Ohio. The St. Louis Wire Nail Company, of St. Louis, were represented by proxy. Nothing but the usual routine business was transacted. The members present reported the trade to be in a fairly satisfactory condition. The next meeting of the association will be held in Cincinnati about August 20 next.

The annual meeting of the stockholders of the Catasaqua Mfg. Company, of Catasaqua, Pa., was held in the office of the company, on Wednesday, the 18th inst. In consequence of the unprofitable character of the iron business for the past six months, and the unsatisfactory outlook for the future, the semi-annual dividend was passed, for the first time in many years.

The Chandler mine, 25 miles east of Tower, on the main range of the Vermilion district, Minnesota, will commence shipping iron ore on the 1st of August, and will forward 600 tons a day of high grade Bessemer. This mine is expected to be a heavy producer and to rank among the big mines of the country. Joseph Sellwood is superintendent of mining operations.

The Iron Mountain Company, of St. Louis, are rapidly opening up the "new find" of iron ore at their Iron Mountain mines in Missouri, notwithstanding the dull market. Prof. W. B. Potter, who has charge of their operations as consulting engineer, is entitled to the credit of this discovery, which resulted from explorations made on his advice and in a direction indicated to him by a thorough study of the geological formation. A very large deposit of a most excellent quality of high grade Bessemer ore has been opened up, which will again bring this company to the front as heavy producers of ore. Faces of ore from 30 to 50 feet thick have already been exposed in the underground workings.

The foundations for the hot-blast stoves, furnace stack and draft stack of the blast furnace at West Duluth, Minn., are about completed, and the brick masonry of the casting house is well under way by this time. The builders expect to begin placing the columns for the furnace stack about the 1st of August. The size of the furnace will be 75 feet by 16 feet. At West Superior, Wis., across the bay from West Duluth, the proposed pipe foundry has been laid out and the erection of the walls has been put under contract. The initial capacity of this foundry will be 50 tons per day.

The Cherokee Land and Iron Company, of Cherokee County, Texas, have proceeded so far in their plans for developing their iron ore deposit as to authorize John Birkinbine, engineer, of Philadelphia, to prepare plans for a 50-ton charcoal furnace. With the sole exception of the State furnace, three miles distant, this will be the only blast furnace in a radius of 500 miles from the site selected. The furnace will be operated on foundry iron.

The Calumet Furnace, operated by the Chicago Furnace Company, and situated at Cummings, near Chicago, was blown out last week for repairs. This furnace ran a year and ten months on a lining which was merely patched when the present blast was started. It was the third blast on one lining, although both the previous blasts were rather short. The hot-blast stoves will be overhauled while the lining is being renewed, and the furnace will probably start up again in 60 days. Charles Himrod & Co., sales agents, state that a sufficient stock of pig iron is on hand to supply the wants of customers in the interval. While the Calumet Furnace

was being blown out, the Minerva Furnace, at Milwaukee, Wis., operated by the Milwaukee Furnace Company, consisting of substantially the same stockholders, was being blown in, after thorough repairs. The Minerva Furnace will run on a Bessemer contract for the remainder of the year, to supply a local steel company.

In May the first Ensley furnace of the Tennessee Coal, Iron and Railroad Company made 4548 gross tons of pig iron, an average of 1027 tons a week, figures which certainly go far beyond anything yet done in the South. The second Ensley furnace was blown in on the 2d inst.

Some changes have taken place in the management of the Norton Iron Works, of Ashland, Ky. D. B. Meacham, formerly secretary, has been elected vice-president and general manager, and J. K. Pollock has become secretary.

A contract was signed with the Chester Rolling Mill Company at Thurlow, Pa., on the 23d inst. for the construction of a new Bessemer steel plant and blooming mill, with a weekly output capacity of from 2000 to 2500 tons. The new steel mill will be completed early next spring and will employ a large force of men.

Contracts have been made for the cabling of the West Madison street railway in Chicago. The tunnel under the Chicago River at Washington street will be used to secure an uninterrupted connection with the business center of the city. About 2500 tons of cast iron will be used for the yokes and pulleys, and 1500 tons of tank steel for the conduit in which the cable will operate.

Machinery.

William Shimer & Co., engineers and machinists, of Freemansburg, Pa., have commenced the erection of a new foundry, 75 x 100 feet, which they hope to have finished by August 1st next. It will increase their capacity about 50 per cent.

The new car shops of the New York and New England road at East Hartford, Conn., which have cost \$250,000, will be ready in 30 days. The plant includes 30 acres and has accommodations for 1300 cars.

The Excelsior Iron works, 160 North Clinton street, Chicago, Ill., have secured a contract from the city of Chicago for 15 steel boilers for the new water works. These are to be tubular boilers, each 62 inches in diameter and 20 feet long, and containing 49 4-inch tubes. W. S. Mallory & Co. will supply Park Bro. & Co.'s steel for this work.

The Whitin Machine Company, of Whitinsville, Mass., will light their large factories with 170 Waterhouse arc lights, to be supplied by the Waterhouse Electric and Mfg. Company, of Hartford, Conn.

At the Ohio Valley Centennial Exhibition, now open at Cincinnati, the John H. McGowan Company, of that city, exhibit pumps of their make run by air pumped by their Rival air pump into a receiver, from which connection is made, the pumps referred to running the same as if operated by steam. They have also a direct-acting steam pump for use in connection with hydraulic machinery for tobacco manufacturers, which is something new in that line. Eight of the Machinery Hall boilers are being fed by means of their Rival boiler feeder, having been used for that purpose since expositions were first held in Cincinnati. One of their Monitor Rivals feeds the 500 horse-power Heine safety boiler which is supplying power to the hall.

Messrs. Lodge, Davis & Co., of Cincinnati, Ohio, are running full on orders, having just secured a large contract from

Messrs. Lloyd, Booth & Co., of Youngstown, Ohio, for some heavy machine tools. They have also an order for an entire machine-shop outfit for the Wm. Anson Mower and Reaper Company, of Youngstown, who propose moving their entire plant to Chattanooga, Tenn.

During the months of May and June of this year the Babcock & Wilcox Company, of New York, sold boilers amounting in all to 8354 horse-power.

Miscellaneous.

Operations are about to be resumed at some of the iron-ore mines along the East Pennsylvania Railroad between this city and Allentown. Work had been suspended on account of the depressed condition of the iron trade, and the miners found employment among the farmers at haymaking and harvesting at \$1.25 per day. They now return to the mines at 80 cents per day for surface work and 90 cents for underground work. — *Reading (Pa.) Times*.

From the Marquette (Mich.) *Mining Journal* of the 14th inst. we take the following: The season's shipments of ore from the Lake Superior mines now amount to 1,350,369 gross tons, this being 192,980 tons behind the shipments at the corresponding date last year. The shipments for the week ending Wednesday were 155,947 tons, of which amount 32,892 tons went from Marquette, 2020 tons from St. Ignace, 51,854 tons from Escanaba, 48,553 tons from Ashland and 20,628 tons from Two Harbors. The shipments of this week show a slight falling off from those of the previous week, the shrinkage being almost wholly in the quantity sent from Escanaba. The following table shows the shipments by ports for the present season to date, and for the corresponding periods in 1887 and 1886:

	1888.	1887.	1886.
Marquette.....	175,089	290,273	344,246
St. Ignace.....	46,709	34,590	21,778
Escanaba.....	722,407	775,433	534,168
Ashland, Wis..	308,096	353,095	215,795
Two Harbors..	98,068	109,368	99,773
Total.....	1,350,369	1,543,349	1,265,760

The J. M. Schoonmaker Coke Company, of Pittsburgh, have secured an order for 2000 tons of coke, to be shipped to Newfoundland via Perth Amboy, N. J. Some time ago the firm shipped 1000 tons as an experiment. It proved so successful and the coke was so much better than the English product that foundries there ordered more. This opens up a new market for Connellsville coke, which gives promise of developing into a healthy demand. The cost of transporting it from the Connellsville region to Newfoundland is about \$5 per ton.

Messrs. Bornholz & Co., 232-234 Front street, New York, have issued a circular letter in which they announce that they are prepared to buy up all kinds of old metals in any shape, with the exception of iron and steel, specifying more particularly dirt and scraps of tin, solder, lead, spelter, type, &c.; scraps, turnings, filings of copper composition, brass, zinc, &c. To those who have on hand waste material of this kind it may be of interest to submit samples to Messrs. Bornholz & Co.

The Bridgeport Crucible Company, of Bridgeport, Conn., manufacturers of black-lead crucibles and plumbago, report an active business. The company are now under the management of Mr. W. T. Macfarlane, who is well known to the trade, having been formerly connected with the Taunton Crucible Company, of Taunton, Mass.

The Chalmers-Spence Company of New York, whose asbestos goods, more particularly their removable pipe and boiler coverings, are well known throughout the United States, removed their Philadelphia

office July 16 from 32-34 South Second street to 24 Strawberry street.

The Aluminium Brass and Bronze Company, of Waterbury, have decided to locate their works in Bridgeport, Conn. At present the company are receiving bids and estimates on buildings, machinery, &c.

The Phoenix Iron Company.

A very pleasant visit was made on Thursday last to the works of the Phoenix Iron Company, at Phoenixville, Pa. About 20 gentlemen made up the party, which was taken in charge by Mr. G. Gerry White, secretary of the company. The party from Philadelphia included Mr. F. Dundore, J. Meeley, C. S. Tyson, G. M. Newhall, G. A. Carson and the Philadelphia representative of *The Iron Age* and Mr. B. Archer, of Camden, N. J. Connected with the new sugar refinery being built by Mr. Claus Spreckles were Mr. A. B. Rorke, the contractor for the building, and Messrs. Watson and Mueller, engineers, besides several other gentlemen. Two special cars carried the party from Ninth and Green street, Philadelphia, directly to the works, at which point they were taken in charge by Mr. David Reeves, president of the company, and Messrs. W. H. Reeves, Amory Coffin and A. Bonzano, who are in charge of various departments of the Phoenix Iron Company's works. The first visit was to the rolling mills, which are 930 feet in length, with 430 front, one of the largest and best equipped mills in the country. The mills were at work rolling steel shapes for the Government cruisers now being built by the Cramps for the U. S. Government, as well as on various other work, including some for the Spreckles refinery. The next building visited was the erecting shops of the bridge works, in which were seen vast quantities of material for shipment to various parts of the country, one portion of upward of 6000 tons being for the new bridge over the Ohio at Cincinnati. The party were next taken to the drafting rooms, in which 40 to 50 draftsmen were at work getting out plans for other work expected to be taken later on in the season. Models of a very interesting character were also shown, explanatory of the various modes of constructing and securing these immense bridges in position, which were of special interest to the engineers. The three blast furnaces were also visited, as well as the blooming mill and new open-hearth plant, which is now being constructed for the company, and which is to be completed at an early date. The establishment, employing about 2000 hands all told, proved to be altogether beyond what could be gone over in a half day's visit, so that a mere glance was about all that could be given to many interesting features. After leaving the works the party were taken to the residence of Mr. David Reeves and were handsomely entertained, returning to the city about 9 p. m., the entire party feeling that they had not only spent a most enjoyable day, but had received enlarged ideas in regard to the magnitude and importance of Pennsylvania's leading industry.

The Calumet and Hecla copper mine has been so far exhausted of water introduced to extinguish the fire that rock from the old workings will once more be hoisted out by the close of this week.

A large deposit of red hematite ore suitable for the manufacture of paint has been found near Monroe, Jasper County, Iowa, and a company is being formed to mine it for that purpose. It is reported to be 20 feet thick and to cover an extent of 200 acres.

The Iron Age

New York, Thursday, July 26, 1888.

Dissolution of an Iron Manufacturers' Association.

For several years the iron manufacturers of Pittsburgh and points further west have maintained an organization known as the Association of Manufacturers of Iron, Steel and Nails. Its principal object was to unite the manufacturers of that part of the country in support of a common policy on the labor question, to meet the issues presented by their workmen, organized as the Amalgamated Association of Iron and Steel Workers. Committees of conference from these two bodies have met annually to discuss rates of wages, and if no cause of disagreement arose they would adopt a scale which was binding on both parties for 12 months from the 1st of July. This year, it is almost unnecessary to say, there was a disagreement, the manufacturers desiring a reduction of the scale on account of the low price at which they were obliged to sell their products, while the workmen insisted on preserving the old rates. The officers of the manufacturers' association and many of the firms composing the membership positively asserted that the reduction of the scale was asked in good faith, and that their rolling mills were prepared to lie idle for months if this concession was not made by the workmen or if trade did not improve sufficiently to make the old scale equitable. On the first Monday in July a general shut-down of the Western rolling mills was made and the struggle began. The signing of the scale by several firms during the first week was conclusive evidence that the manufacturers were not presenting a united front, but the officers of their association stated that they expected these defections for special reasons. More followed in the second week, and their action was also explained on special grounds, but by the beginning of the third week it became plainly apparent that only a portion of the manufacturers would be left to continue the contest. They did not propose to keep their mills standing idle, however, and see their trade falling into the hands of competitors, and on the 18th inst. the Conference Committee of the association met at Pittsburgh and concluded to dissolve, releasing the members from all pledges regarding the starting of their works. This is accepted generally as a dissolution of the organization, and some of the manufacturers of Ohio are already discussing the formation of a new association to look after their local interests.

For several reasons, which it is unnecessary now to discuss, this is a bad year for labor contests, if they can be avoided. A number of the manufacturers must have been of this opinion, or the disintegration of their forces would not have been so rapid, and would not have

included so many prominent establishments among those which first yielded. There are some, however, who sincerely believed that the trade conditions required a lowering of the wages scale, and who earnestly desired a contest to be fought out on this line if their mills had to lie idle for months. They are inclined to take a gloomy view of the collapse of the manufacturers' strength and look forward with apprehension to the future. The lower wages paid in the East are alleged to give the mills of that section an advantage in markets which are claimed to belong naturally to Western manufacturers. At all events the Eastern mills will be better able to hold their own against Western competition now that Western wages are to be maintained at the old level. If serious results to Western manufacturers follow the action which has thus been forced upon them by some of their number, a bitterness of feeling will be created far surpassing the chagrin now manifested by those who were in favor of heroic measures. The dissolution of the Manufacturers' Association is the first important event indicating ill feeling.

This disruption of an association which had existed for years is variously regarded. The leading members of the Amalgamated Association are reported to deplore it, because they preferred to treat with a committee representing all the mill-owners rather than with each manufacturer separately. Some of the principal iron companies also regret the occurrence very much, as they fear that the strength of the labor organization will be increased in the proportion in which the manufacturers have divided their power. There are others, however, and they are by no means few, who regard the whole matter with indifference, alleging that the association merely existed for the transaction of business which each member was perfectly able to take care of himself, and that it will be found in time that no harm has been done to anybody by the abandonment of a conference committee which only nominally represented the mills. Its importance was largely fictitious, owing to the great changes which have of late years taken place in the Western iron trade, and through which the interests of manufacturers do not lie so much in common as was once the case. Many mills now devote their attention to specialties, instead of making finished iron and steel for the general market, and only in the primary processes of manufacture do they find themselves in line with their neighbors. Sufficient uniformity may exist to make a general scale of wages applicable, but, as to times and seasons of dullness and brisk trade, special considerations enter which will prevent a simultaneous shut-down, unless it is agreed upon long in advance, and every manufacturer then makes his preparations for it in good faith. Evidently this was not done in anticipation of the lockout of July, 1888.

The announcement that a delegation of American glassworkers sailed for Europe on the 21st inst., to endeavor to "organize" the Transatlantic glassworkers, recalls the effort made from 1870 to 1872 by American ironworkers to induce their English co-laborers to demand better wages. The details of the scheme were

not made public, but labor agitators were quietly sent from this side to show English workmen how much more they ought to receive for their labor than they were being paid, citing the rates of wages ruling on this side of the ocean as evidences of what men were entitled to in their occupations. The result of the mission was beneficial to some extent, as wages were raised at numerous works in compliance with the demands made, but a depression in trade soon after came on, and the advance was lost in spite of very extensive and protracted strikes, in which the supply of labor was shown to be hopelessly in excess of the places to be filled. The professional labor agitator will find abroad a good field to work in, and he will be entitled to genuine praise if he can not only succeed in elevating labor, but can also permanently sustain it on a higher level.

Important Acts of the Legislature.

The New York Legislature met on Tuesday, 17th inst., in extraordinary session, the special object being to provide for the employment of convicts in the State prisons, and its proceedings lasted four days. Messages upon other topics were received from the Governor from day to day, but none excepting those relating to labor and the Aqueduct were acted upon. Senator Fassett, Chairman of the Aqueduct Investigating Committee, was gratified in the passage of a bill by a decided vote, abolishing the present Aqueduct Commission and substituting a board composed of Mayor Hewitt, Controller Myers, Commissioner Newton, of the Department of Public Works, and four citizens, two Republicans and two Democrats, to be appointed by Mayor Hewitt. Moreover the act gives the Mayor of New York and the Governor authority to remove on charges the Aqueduct Commissioners—a power, it is said, which they do not now possess. The Governor has already approved the bill. Mayor Hewitt pronounces it a step in the right direction, and says he will appoint as commissioners four of the most independent men he can find, who will outvote him every time he is wrong.

No small share of interest was concentrated on the prison labor question. The measure adopted is known as the Yates bill, which was defeated in the regular session. It provides the sum of \$250,000 and abolishes the State account system. It declares that none of the goods made in the penal institutions of the State shall be sold except to the State charitable institutions. The convicts henceforth shall do no labor except hand labor, the use of machinery in the prisons being forbidden. It is to be deprecated that a measure so radical could not have had more deliberate consideration than was possible at a special session, especially as it is so much entangled with the labor question as represented by trades unions in prospect of the pending election. A recommendation of the Governor concerning a modification of the conspiracy laws, and which originated with the Central Labor Union, was allowed to slumber until some future occasion. At best the Yates bill can only be regarded as a temporary expedient adopted in deference to the labor vote. It is hardly possible that the State ac-

count system, with all its plant of valuable machinery and well organized processes, to say nothing of the skill acquired by men during their confinement, fitting them for future usefulness, will be so summarily done away with.

The Western Iron Trade.

Fires, accidents, labor disputes, lack of business and insolvency have latterly been operating with unpleasant harmony in suspending activity at quite a large number of Western iron establishments. Taking also into consideration the nail factories and steel works now running on part time only, the diminution of production has been very heavy, and, if the depression in business can be cured by a curtailment of the output of iron and steel, the remedy is being administered in doses which ought to insure speedy recovery. Undoubtedly the first step toward securing a better condition of the trade is to adjust the supply to the demand. Prices will then cease to decline. After that other circumstances must determine the extent of the demand—its growth or decay.

Judging from the recent course of prices it would seem that—in the West at least—the supply had been brought down to proper dimensions to suit the demand. Bar iron has been quite steady; pig iron appears to have touched bottom; plate iron is firmer and wrought-iron pipe resists attempts to force it lower. The association of Western bar-iron manufacturers, formed at Cleveland on the 27th ult., will, if it meets the expectations of its promoters, assist still further in preserving the proper relations between the supply and the demand and will extricate the trade from its present unsatisfactory condition. While Bessemer pig iron is the only kind in which there has thus far been an actual advance in price, other classes of pig iron are not being offered so freely, and shrewd buyers are quietly absorbing the cheap lots on which they had been given option some time since. The cheapest grades of Southern iron are firmer and not so abundant as they have been. Even old rails are not so weak as they were a month since, when free offerings met with a quick response from buyers, which soon changed the tone of the market.

But the conditions now prevailing seem to favor a better state of things than merely a balance of the supply and demand. It is true that orders for steel rails are far below the capacity of the mills, and that a very important branch of the iron and steel trades is thus deplorably dull, yet railroad building has not been suspended this year, and the new mileage so far laid surprises nearly everybody, while the prospects for the closing months of the year are fairly bright. A better demand for rails will surely be felt in the next six months. Even now large orders could be taken if bonds would be accepted in whole or part payment for them. With abundant money and with idle capital accumulating in our financial centers it would be strange if the best of the projected railroad enterprises should not be undertaken while rails and other railroad material as well as labor can be had cheap. The fact that this is Presidential year may influence some enterprises, but there are plenty of others which will be pushed

without regard to that disturbing influence. The crop prospects are also continually improving, and the indications are that we shall not only raise enough for our own wants, but that we shall have something to spare for export. With our farmers prosperous the nation is blessed. A direct result of their prosperity is the heavy trade in agricultural implements which is now in progress, and which in some lines surpasses all previous experience. Three of the largest manufacturers of harvesting machinery in the Northwest state that by the 1st of August they will have empty warehouses, whereas they usually carry over a good stock to the following season. Their orders for material to be worked up into farm machinery for next year will be larger than ever, and the iron and steel trades may expect to be correspondingly benefited. When these abundant crops, which now seem to be assured, begin to be moved, the railroads of the West will be lifted out of the Slough of Despond, and their increased earnings will enable them to make sorely needed repairs and add to their equipment, also with benefit to the iron and steel trades. The collapse of the Western rolling-mill lockout is far from being a calamity under these circumstances. Individual manufacturers may suffer loss or receive no profit from the operations of their mills because their workmen are paid a higher rate of wages than present selling prices justify, but the country generally is the gainer by the resumption of activity in an industry employing many thousands of well-paid men and consuming materials whose production and transportation employ other thousands.

Much more of an encouraging nature could be gathered from the situation, but it is not our purpose to enter fully into such details, as a wrong impression would be created. The prospects are not favorable for a "boom" by any means, but, on the other hand, those who are waiting for prices to settle still lower in consequence of a more depressed state of trade should heed the conditions now existing and not defer their purchases too long. The evident holding back of orders for the past three months, and the large consumption going on, must have resulted in low stocks in many lines of goods throughout the West, and if a general buying movement should set in a sharp advance would result. This is not desirable and would not be beneficial to business in the end, as the inevitable reaction would cause business to sag again, with the usual unsatisfactory results to buyers and sellers.

It is a matter of congratulation to the members of the iron and steel trades that the present severe depression in business and the long-continued decline in prices have not been accompanied with numerous and important failures. Few have been reported thus far, and of them the most conspicuous have been caused by outside operations apart from the legitimate conduct of their business in manufacturing iron or steel. This argues a soundness of financial condition among our manufacturers which is indeed highly gratifying, and at the same time speaks volumes for their generally excellent management, through which this has been secured.

A Tin-Plate Industry.

The tin-plate question has been so thoroughly discussed in public and in private for years that it would seem almost impossible to present a new phase. Yet there is a new view of it to be taken, and possibly it may upon examination be found to be an important one. Nobody is satisfied with the present rate of duty imposed on tin plate. It offers no inducement to capitalists to embark in the business of manufacturing tin plate, as they cannot figure out a possible profit on the investment of capital and the expenditure of time and energy required to equip and operate the works, when tin plates can be laid down in this country so cheaply, paying 1 cent per pound duty, by the Welsh and English makers. Nor are the American consumers of tin plates pleased with the existing arrangement. The duty of 1 cent per pound appears to them to be a wholly unwarranted tax on their business, as the revenue derived from it is not required by the national Government, and has proved to be of no use in building up, under its protecting influence, a tin-plate industry in this country. The manufacturers of black and galvanized sheet iron and their special customers defend the duty, not because they deem it right in itself, but because their trade will be seriously disturbed if tin plates can be brought into this country at a considerably lower price than is now charged for them.

The rate of duty, from present appearances, bids fair to be continued as it now stands, notwithstanding the determined effort which has been made on the one hand to remove it and the urgent appeals from important interests on the other hand to double it. If it remains at 1 cent per pound what will be the outcome? Will those who desire to see a tin-plate industry established in this country continue their slow course of agitation and education in favor of higher duties, hampered meanwhile at almost every session of Congress by appeals for the total abrogation of the duty? The last serious attempt to advance the duty was made in 1883, when the tariff was revised largely upon the lines laid down by the Tariff Commission. The commission recommended a duty favorable to the views of the advocates of an American tin-plate industry, but a Congress of protectionists refused to be guided by their advice and even reduced the duty from the old rate of 1½ cents. From 1883 to 1888 what has been done? Five years have really been wasted.

The vital point to-day in the discussion of the tin-plate question, in the light of the possible creation of an American tin-plate industry, is that no attempt is being made at the actual establishment of thoroughly-equipped works on this side of the Atlantic. Quires of foolscap have been wasted in writing on the subject and bewailing the unfortunate position of America in not supplying her own wants in this important branch of trade, but nothing tangible is being done, and years and years are being allowed to slip by unimproved. Those who say that higher duties will start the wheels of enterprise and set them in active motion are told that protective duties are intended to protect something in existence and not to create industries, if indeed they are not told that

higher duties would be useless because the art of making tin plates is not understood by our people.

It is suggested that it rests plainly with the advocates of an American tin-plate industry to get together, subscribe the necessary capital, build tin-plate works, operate them, show that good tin plate can be made here, publish the actual figures of cost from their books showing what can be done under the most careful and economical management. Then it is urged they may trust to the good sense and patriotism of the American people to do what seems to be right afterward to continue the start thus made toward founding a new industry. It is insisted that the manufacturers of sheet iron, of galvanized iron, of roofing materials and of all other articles affected by the condition of the tin-plate trade are the people who should contribute to an experiment of this kind and do all in their power to make a practical test of the tin-plate question. It is argued that if they do not there is little hope that the end they desire can be accomplished, while there is every prospect of increased protests from consumers having the effect in time of entirely wiping out the tin-plate duty.

Engines of a class now but seldom met with in large sizes are those of the trunk type, which in past years, working under low pressures, have been known to give very good results. With the main peculiarities of their design many of our readers are no doubt familiar, the pistons being made of cast iron, and, with their trunks, constituting really open-ended cylinders working through large stuffing-boxes in the covers of the engine cylinders proper. In virtue of this construction piston-rods were entirely dispensed with, and the connecting-rods were directly attached to pins bolted to the pistons inside the trunks. The compactness secured in this way was the chief advantage gained, especially for use on board ship, where economy of space is always an important desideratum. In this respect the engines compared favorably with those of the oscillating type, admitting, moreover, as the latter also, of being so placed as to bring the center of gravity to a low level. Even with low pressures, however, considerable difficulty was experienced in keeping the trunks in a steam-tight condition, and the exposure to the atmosphere of large surfaces coming in direct contact with the steam in the cylinders gave rise to appreciable losses from radiation and condensation. In these circumstances may be found a partial explanation of the relegation of the trunk engine to comparatively light work, for which we still find it sometimes used, some of the older makers of small hoisting plants supplying examples. One of its features, which we did not mention above, is the absence of crosshead and guides. It is on this account that trunk engines are always worked in the opposite direction to ordinary engines, no downward thrust of connecting-rod being thus added to the weight of the piston and trunk to be supported by the cylinder surfaces. This weight alone is very often considerable and would scarcely admit of being increased without causing great wear. With the direction of revolution adopted the thrust of the connecting-rod is always

upward, and the weight resting on the cylinder surface is therefore only the difference between the two.

Naphtha Launch Engines.

Elsewhere in this issue we publish results of several tests which were made at Stevens Institute a short time ago with the view of determining the cost of power in the recently much-talked-of naphtha launches. The results are at the present time specially interesting, bearing out in a great measure the truth of the claims made for the engines in point of economy, and moreover opposing, though only apparently, much that has hitherto been regarded as incontrovertibly established by the accepted laws of thermo-dynamics. Experiments which have been conducted in England within the past few weeks with practically the same type of engine as that used by Messrs. Doty and Beyer in their work at Hoboken have, in addition, given results which tend to thoroughly sustain the conclusion that, as compared with steam, naphtha vapor is much the more economical working fluid in an engine cylinder. It is greatly to be regretted, however, that the conditions under which the Hoboken tests were made did not admit of giving the subject as much time as its importance warranted, and some very desirable comparisons had, therefore, to be omitted, the work thus being left incomplete, though still in such shape as to indicate about what might be expected. We refer particularly to the fact that the engine was tested under naphtha alone, no steam test being made, and no comparison of the powers developed and actual costs of running with the two fluids therefore being possible. We are glad to know, however, that this matter will receive special attention in another and more extensive series of trials shortly to be carried out at Stevens Institute. In the present instance, moreover, the engine, as the published indicator diagrams show, worked under the disadvantage of late valve opening, and attempts to run at a speed higher than that obtained—about 280 revolutions per minute—proved unsatisfactory. The power developed, therefore, fell short of the full capacity, being a little over 0.9 horse-power for each of the three cylinders, or, according to the table of results, a total of 2.8 horse-power, and with the ruling market price of naphtha at the time of the test the cost per horse-power per hour was 6.2 cents. It is in this figure probably more than in any of the other results arrived at that interest will chiefly be felt, though here, as well as in the determination of the quantity of water necessary to condense the naphtha vapor exhausted from the engine, the want of a basis for comparison will be keenly experienced.

In the absence, for the present, of this information from the report before us, it is of interest to turn to the records of the English trials, in the course of which naphtha and water were used alternately. The trials themselves, as reported in the *London Engineer*, consisted of continuous runs of three hours' duration, over a measured distance, during which, at frequent intervals, indicator cards were taken, and the number of revolutions of the engine and the speed of the launch recorded. The difference in power developed was

very marked, and the speeds were found to be practically those due to the differences in power, confirming thus the correctness of the diagrams. When running with naphtha the mean results of four trials were as follows: Cylinder pressure, 84.85 pounds; revolutions per minute, 263; indicated horse-power, 2.588. For steam, under precisely the same conditions, the figures were, 15.09, 141 and 0.598 respectively. These results, we need scarcely say, may be studied with a good deal of interest. The English experiments showed also that with steam the engines developed about 1 horse-power for every 17 square feet of boiler heating surface, while with naphtha barely 4 square feet were sufficient to accomplish the same work, the reduction of boiler weight per horse-power when using naphtha being thus very remarkable. It is interesting to note here that in the case of the engine tested at Stevens Institute a very close approximation to one of these figures was obtained. The heating surface of the boiler there used may be taken according to the given dimensions as about 12 square feet, not sufficient, if we accept the customary rating for steam boilers of 15 square feet for each horse-power, to develop one horse-power when working with steam, and yet giving with naphtha a little over 2.8 horse-power, or a proportion of about 4.2 square feet of heating surface to each horse-power. Assuming, as was actually the case in the English trials, that equal amounts of heat are supplied to the boiler both when running with steam and with naphtha—or, in other words, that the quantities of stored up and available energy are the same in both cases, it is obvious that the superior result obtained with the naphtha vapor is entirely due to the fact that the proportion of this energy held by it which can with present methods be converted into useful work; is greater than that which can be obtained from the steam. A comparison of the latent heats of evaporation and of the methods of condensation which are necessarily employed will more clearly illustrate this. For the present, therefore, it may not unreasonably be questioned whether successful competition of a non-aqueous vapor with steam is so entirely impossible of achievement as it has been generally represented to be. In any event, further investigation both here and abroad bearing upon the merits of the naphtha engine will be followed with interest.

The contest over railroad freight rates in Iowa continues very interesting. A strong protest has been made against the new rates fixed by the State Commissioners, the railroad companies claiming that the schedule adopted was ruinous to them and that it was much lower than the rates paid in more populous sections of the country. Their appeal to the courts to interfere in their behalf has already been referred to in these columns. In view of this litigation the commissioners are advising shippers to pay the rates charged in excess of the tariff under protest and to await the final decision of the matter. In the meantime, shippers are sending to the commissioners, to be used in evidence in the courts, bills of lading on all the different roads interested, showing rates paid from one-fourth to one-half less than the

new State tariff, and these rates were voluntarily made during the period extending from December to June. Nearly 1000 of these silent but powerful witnesses against the railroads had been received up to last week and more will probably follow. They will establish a justification of the action of the commissioners which will be difficult to combat. Evidence has also been submitted to show that the Iowa tariff is not lower than on Eastern roads in populous districts, the rates submitted as charged on the Pennsylvania Railroad being one-half lower. Whatever the outcome of this contest may be, it is evident that the Iowa shippers are determined that they will secure more considerate treatment from the railroad companies traversing their State.

The great "Q" strike, like Banquo's ghost, will not down. Although the company's officials have professed to ignore the existence of a strike, the financial statements published show that a surplus of \$1,000,000 at the end of last year has by some means become converted into a deficit of \$3,000,000, which can be accounted for on the theory that the company and the discharged engineers are engaged in a relentless struggle. Chairmen Hoge and Farrell, of the local Grievance Committee, agree that there are 1600 engineers and firemen now in idleness who are drawing on the treasury of the order at the rate of more than \$1,500,000 per annum. Already the expenditure exceeds \$800,000, according to common report, and it is not difficult to believe that on either side the situation is becoming desperate. Contemplating this whole affair, no friend of law and order has reason to regret that the courts are at last compelled to take cognizance of the facts in the case. It is alleged that an overt act has been committed in the placing of dynamite upon the tracks of the "Q" road, thereby hazarding life and property. Upon this showing no compromise is admissible apart from the infiction of penalties that shall fully vindicate the majesty of the law. The most serious fact in the situation is the attitude of the Brotherhood of Engineers in its relations to the alleged offenders, which is equivocal, to say the least. Chairman Hoge, of the striking engineers' Grievance Committee, and Chairman Murphy, of the firemen's committee, are among those now out on \$5000 bail, charged with being deeply implicated in the conspiracy. Despite this fact the singular spectacle is presented of these men "virtually doing the company's work," as explained by the counsel for the prosecution, at whose request the trial, to have taken place on the 21st, was postponed to July 28th—the alleged conspirators meanwhile making an extensive tour among their disaffected compatriots at St. Joseph, Galesburg, Creston, Atchison, Hannibal, Quincy, &c. Already the ominous intelligence comes from Chairman Hoge, at Omaha and St. Joseph, that "the votes thus far taken are practically unanimous for continuing the strike," all of which may be construed as a rejection of the terms offered by Arthur and the "Q" officials, and a resolve to persist in the ruinous course which Hoge and others seem to have marked out for themselves,

possibly once more stopping the interchange of freight by all connecting roads. But the courts remain to be heard from. Clearly enough the course of events fore-shadows a disruption of the Brotherhood, by which process it will be purged of the radical element.

CORRESPONDENCE.

Nickeline.

In reference to the inquiry which we published last week for the address of the makers of "nickeline," we have received from Messrs. Belcher & Loomis, 60 to 64 Weybosset street, Providence, R. I., the following letter, addressed to our correspondent, "J. B. K.":

"We answer your inquiry for nickeline by stating that it is made by the Wessell Metal Company, 521 West Twenty-fourth street, New York. We are selling agents, and the price in 100-pound lots only is \$1 per pound, the metal not being thinner than No. 25 by the Brown & Sharpe gauge.

"In this connection allow us to call attention to another metal, for which we are also agents, called Corinthian Silver. This also is as white as nickeline, and possesses the same non-tarnishing quality. It differs from nickeline in that it can be shaped, raised, spun or struck up in any form, the same as sheet brass. Nickeline will not do this, being very hard and stiff, like a plate of steel. The price of Corinthian Silver is 60 cents per pound up to No. 20 A B gauge in any quantity. We are selling just now large quantities of this to manufacturing jewelers, who make it up into ornamental boxes and charms and ornaments to hang on the watch guard, and which they probably sell for silver. In fact, it is better than silver, because it holds a beautiful polish and will not tarnish or change color. In wire it costs 15 cents more. Thinner than No. 20 is advanced 1 cent per pound for each number up to 26 and 2 cents for each number above 26 to 36."

The Chicago Smelting and Refining Works.

E. A. C. Du Plaine, proprietor of the Chicago Smelting and Refining Works, has erected a building specially adapted to his business at 240 South Jefferson street, corner of Congress, Chicago. His old quarters at 64 and 66 South Canal street, which were sufficiently large in the early days of the establishment, were outgrown, and more extensive facilities have for some time been required. In the new building referred to, the arrangements are such as to insure the operation of every department to the best advantage. The works occupy a lot 30 feet in width by 125 feet in depth. The foundry department has a capacity of two No. 150 crucibles, two No. 80 crucibles and two No. 50 crucibles, equal to 4000 pounds of brass or bronze daily. The necessary core ovens and molding tubs are provided. The building is very light, ample room is given to the machinery, and wherever improved appliances could be introduced they have been used, so as to secure the highest efficiency.

The list of products made by Mr. Du Plaine is quite extensive, embracing bronze or brass castings, phosphor-bronze, nickel-bronze, architectural or ornamental work, and United States standard gun metal work of any required weight for machinery, engines, rolling mills, mining pumps and railroads. A special plant is employed for making anti-friction or Babbitt metals, tin-smiths' and plumbers' solder, plumbago and nickel Babbitt, stereotype and electro-

type metal, coffin and fusible alloys, &c. The erection of the new works enables Mr. Du Plaine to add the assurance of prompt execution of orders to the guarantee that the goods ordered will be of the best quality.

The Strike at Singer, Nimick & Co.'s Works.

A conflict of no little importance is now being waged at Pittsburgh between Singer, Nimick & Co., Limited, the well-known steel manufacturer of that city, and the Knights of Labor, the outcome of which is being anxiously watched for not only by the parties directly interested, but by other manufacturers and labor organizations all over the country. The differences which led to the trouble are somewhat different from those frequently occurring between firms and their employees, as the controversy is not one of wages, but was caused by the firm arriving at the conclusion to conduct their business in the future independent of the Knights of Labor, the Amalgamated Association or any other labor organization. Last May the firm announced that a 10 per cent. reduction in wages would be made, to take effect on the first day of June. The majority of the workmen belong to the Knights of Labor, while a few are members of the Amalgamated Association. The men decided to accept the reduction, and continued at work without interruption until the annual meetings of the above-named organizations, which were held in Pittsburgh last month. As soon as the officers of these organizations learned that the men had accepted a reduction in wages without being authorized to do so they were at once notified that they must demand the restoration of the reduction or be expelled from their association. The men at once complied, and when a return to old wages was refused struck, the works being closed down in all departments. On Wednesday, the 27th ult., the firm announced that all their employees had been discharged, and that any person wishing to enter their employ must do so independent of any labor organization—or, in other words, the firm had decided to employ only non-union men. The firm later announced that the 10 per cent. reduction in wages had been withdrawn, and the same wages would be paid as before the reduction was ordered. The action of the firm in discharging all their employees was wholly unexpected by the Knights of Labor and the Amalgamated Association, and at a joint meeting of these bodies it was decided to notify all their members to remain away from the works until the trouble is settled. Any member who resumes work without permission will be at once black-listed. Up to this time the firm seem to have decidedly the best of the situation, as about one-half of the works are in operation, and applications are being received every day from old employees who wish to return to work.

It is confidently predicted that inside of a month enough men will have been secured to run the works full time in all departments. In view of some very disastrous defeats which the Knights of Labor have suffered in Pittsburgh during the present year, it is safe to assert that that organization is not the power it once was. It sustained a defeat some months since at the hands of Park, Brother & Co., Limited, proprietors of the Black Diamond Steel Works in that city. The plant of this company is one of the largest in the country, and its employees are all non-union men. No labor organization of any kind is recognized. Only a few months ago Carnegie, Brothers & Co., Limited, proprietors of the Edgar Thomson Steel Works, administered a crushing defeat to this organization which came well nigh

disrupting it altogether, and now comes Singer, Nimick & Co., Limited, who bid fair to do the same. From these facts the deduction is drawn that the Knights of Labor are slowly but surely losing their hold, and that in time the organization will exist only in name, so far as the Western steel mills are concerned.

Washington News.

(From Our Regular Correspondent.)

WASHINGTON, D. C., July 24, 1888.

The Tariff Reduction bill of the Committee on Ways and Means, after a long and tedious discussion, has at last passed the House of Representatives. The vote, as is known, was: Yeas, 162, and nays, 149. This gave the bill 13 majority, which was larger than was expected by the friends of the measure. The illness of Mr. Randall had something to do with the scattering of his followers, who originally numbered eight, and fell to four when the vote was taken.

Chairman Mills has had a very carefully compiled table prepared, which shows the operations of the bill upon articles placed on the free list and in the schedules. The following is the official exhibit:

Free List	1887.—Importations.		Average ad val'm under	
	Value.	Duties.	Present per cent.	Proposed per cent.
Wood, salt, hemp, chemicals, metals, &c.....	\$61,672,120	\$16,799,450	27.24
Wool.....	18,206,988	5,390,054	29.00
Total free list	\$79,879,108	\$22,189,504	27.78

Schedules.	Importations of 1887.		Estimated		Average ad valorem under	
	Values.	Duties.	Duties under proposed bill.	Amount of duties remitted.	Present per cent.	Proposed per cent.
A. Chemicals.....	\$5,060,325	\$2,012,121	\$1,133,847	\$878,274	39.84	22.45
B. Earthenware and glassware.....	10,492,067	6,920,108	5,163,820	1,756,288	65.96	49.21
C. Metals.....	16,152,789	8,456,847	6,976,375	1,480,473	52.35	43.19
D. Wood and woodenware.....	889,559	307,805	260,218	47,587	34.60	29.25
E. Sugar.....	68,897,102	56,515,602	45,223,514	11,292,088	82.04	65.04
F. Tobacco.....	26,441	21,567	10,064	11,502	81.57	38.06
G. Provisions.....	3,235,988	1,711,806	1,890,321	831,485	52.89	42.65
I. Cotton and cotton goods.....	2,423,585	1,233,600	955,989	277,610	50.90	40.00
J. Hemp, jute and flax g'ds.....	17,434,514	6,228,310	4,185,955	2,042,356	35.72	24.01
K. Wool and woolens.....	42,448,127	29,256,443	16,925,862	12,330,581	68.92	39.87
M. Books, papers, &c.....	57,298	13,982	10,425	3,557	24.40	18.19
N. Sundries.....	11,221,253	4,984,936	3,905,795	1,079,141	44.42	34.79
Total dutiable.....	\$178,329,049	\$117,663,127	\$86,132,185	\$31,530,942	65.98	48.30
Total free list.....	79,879,108	22,189,505	22,189,505	27.78
Total.....	\$258,208,157	\$139,852,632	\$86,132,185	\$53,720,447	54.16	33.36

It will be seen that the aggregate average ad valorem reduction in the free list is 27.78, and under the schedules of dutiable articles from 65.98 per cent.; the present average standard of protection, down to 48.30 per cent.

The Senate Sub-Committee on Finance closed their hearings for the present last week. A delegation representing the metallurgical interests under the bill, consisting of H. W. Oliver, John Kennedy and Robert G. Bushnell, of Pittsburgh; Cyrus Elder, of Johnstown, and Charles J. Gilpin and J. M. Swank, of Philadelphia, gave the committee the benefit of their knowledge and experience in this important branch of industrial enterprise and activity. In the Senate bill cotton ties are left at 35 per cent. ad valorem; tin plate at 1 cent., and steel rails $\frac{1}{8}$ cent a pound.

The House bill has been referred to the Senate Committee on Finance. That com-

mittee is ready with its substitute, but there seems to be a hitch in the proceedings. The Republican Senators are divided upon the expediency of embarking in a long tariff debate at this unusually late date in the duration of a session of Congress. The opponents of discussion favor reference of the Mills bill to the Committee on Finance, with authority to sit during the adjournment of Congress and with instructions to take testimony and mature a bill making a reduction of \$70,000,000 of revenue by repeal of the tobacco tax and duties on sugar and alcohol used in the arts, together with such an adjustment of duties as may be in harmony with the maintenance of the principle of protection of home industries. The other wing favor reporting a substitute for the House bill forthwith and pending the debate continue their hearings.

The Democrats, upon the advice of the President, favor discussion. The President is not satisfied with the debate in the House. He regards it there as having been of a sectional character viewed from the standpoint of the interests of the district represented by the Speaker. In the Senate he expects a broad national view to be taken of the doctrines enunciated in his message, which will represent it to better advantage. The Republicans will hold a caucus to determine their course. It will require a unanimous vote on their part to postpone, as the Democrats will be equally solid on the other side. If the tariff debate is once begun in the Senate the middle of September will have arrived before the end of the contest will have been reached. The Senate will doubtless have passed their substitute. The question will then be thrown into conference. The conferees will disagree, pending which Congress will adjourn. The two propositions, the House bill and the Senate substitute, will then stand side by side with the people in the campaign to decide for

themselves as to the safest and surest method of reducing redundant revenues.

The Attalla Furnace.—The Attalla Furnace Company, of Chattanooga, Tenn., of which L. S. Colyar is president, D. J. O'Connell is vice-president and D. W. Hughes is secretary, are pushing work on their furnace at Attalla, Ala. The stack is to be 55 feet high by 11 feet bosh, equipped with cast-iron stoves of special pattern, with 60 pipes, and two boilers, each 54 inches in diameter and 28 feet long, and two 18-inch flues. The Weimer engine has a 26-inch steam cylinder and 60-inch blowing cylinder, with 4-foot stroke. The iron cast-house is 55 x 100 feet. Of the three stock-houses two are 50 x 150 feet and one 50 x 300 feet, with elevated tracks and a full equipment of tracks for all other purposes. The foundations are now complete and all the ironwork is on the ground.

All the machinery is contracted for and will be on the ground by October 1, and it is expected that at the latest the furnace will be in blast on January 1, 1889. The furnace is to be run with charcoal, with a view of making high grade car-wheel iron. The ore to be used is what is known as the Dirt Seller vein, obtained near Round Mountain, 30 miles from Attalla, on the Rome and Decatur Railroad. Iron has been made from this ore long before the war, and was used quite extensively in the mixture at the Confederate States Gun Foundry, at Selma. For car-wheel purposes and for requirements calling for great strength the iron made from this ore has acquired a reputation.

Rapid Transit in Chicago.

The South Side Rapid Transit Company, of Chicago, deposited \$100,000 with the city treasurer on the 20th inst., in compliance with the terms of the ordinance empowering them to build and operate their elevated railroad. The line is to be completed for one mile from Van Buren street within two years, or this money will be forfeited. The route to be traversed by the road is as follows: Commencing at the North line of Van Buren street, at some point between Dearborn and Wabash avenue, and running southwardly over such lots, lands and property as the company now own or hereinafter may acquire between Dearborn street and Wabash avenue to a point to be selected by the company between Thirty-seventh and Thirty-ninth street, thence eastwardly or south-eastwardly, to a point to be selected by the company between Dearborn street on the west and Forest avenue on the east, at which point to cross the city limits. The right of way to be acquired must not exceed 80 feet in width, except at curves and termini and at intermediate stations. The right of way must be parallel with and immediately adjacent to an alley or alley lines. The structure in style, strength and architecture is guaranteed to be equal to the best in New York, Brooklyn and Boston. The rate of fare to be charged is not to exceed 5 cents per passenger for any one continuous trip within the now city limits. It is understood to be the intention of the company to construct three tracks. This will enable them to mass the cars and run through trains into the city in the morning and out of the city in the evening on the third track, while the regular local trains, stopping at all stations, will be run on the other two tracks. Condemnation of property for the right of way has already begun.

Superintendent Bell of the Foreign Mails Service has received a copy of a contract concluded in January last between the Government of the Argentine Republic and Robert P. Houston, of England, by which the latter agrees to construct ten steamers of at least 4000 tons burden and 16 knots per hour each, to ply between the north of Europe and the ports of the Argentine Republic, and four steam launches for emigrant service in Europe; also four steamers to ply between the United States and the ports of the Argentine Republic. The Government of the Argentine Republic guarantees a loan of 5 per cent. per annum on £1,250,000 for the European service, and 5 per cent. per annum on £360,000 for the United States line.

With a weight of 20,000 pounds on each driving wheel of a locomotive, a safe maximum has probably been reached. Close examination of the steel rails where engines having this enormous weight on the drivers are running, indicates that the limit of economy has been passed.

CHILI.

VALPARAISO, May 25, 1888.—*Copper*.—Up to the 14th inst. \$30 $\frac{1}{2}$ quintal was still paid, but on lower cable news a decline subsequently took place to \$24.80, dealings aggregating 10,785 quintals, the latter price with 27/6 freight per steamer, equaling £71. 18/8. *Nitrate*.—The demand both for Europe and the United States abated somewhat during the fortnight, transactions being limited to some shipments per steamer. Holders have meantime remained quite stiff at \$2.72 $\frac{1}{2}$ @ \$2.75 for 95 %, which equals, with 28/9 freight, 8/31 $\frac{1}{2}$ cwt., there being a scarcity of 96 % Nitrate, \$2.90 is asked for the same. Sales sum up only 84,500 quintals. Charters have amounted to 19,800 tons for Europe. There were shipped since January 1:

	1888.	1887.	1886.

Total..... 4,142,785 3,301,608 2,180,987

Coal has been sustained: We quote Newcastle, February shipment, 55/; March, 49/; April, 43/6 @ 44/6; May, 37/6, and June, 36/; Australian, August, 33/. *Exchange*, 90 days' sight, 25 $\frac{1}{2}$ d.—*Weber & Co.*

WEST INDIES.

PORT OF SPAIN, TRINIDAD, June 22, 1888.—*Asphaltum*.—A moderate demand has prevailed since my last reports, at well-sustained figures. I quote to-day, f.o.b., including export duty: Balled, $\frac{1}{2}$ ton, \$14.04, and Crude, \$6.84. There have been shipped altogether since January 1, 26,081 tons, against 16,412 last year, and 14,696 in 1886. *Exchange*, 90 days' sight, \$4.74 @ \$4.80.—*E. P. Masson.*

SOUTH AFRICA.

PRETORIA, June 11, 1888.—*Gold*.—The May gold production of the Witwatersrand gold fields has been 19,002 ounces, as compared with 15,853 in April; 14,706 in March; 12,161 in February, and 11,299 in January, constituting a total in five months of 72,991 ounces, and demonstrating the rapidly rising importance as a gold producer of the district named.—*Tremvaal Mining Argus.*

EAST INDIES.

COLOMBO, June 14, 1888.—*Plumbago*.—Our market has been moderately active and steady. We quote in rupees $\frac{1}{2}$ ton: Large Lumps, 145 @ 160; Ordinary ditto, 125 @ 150; Chips, 80 @ 95, and Dust, 40 @ 65. Shipments since October 1 have been as follows: To England, 53,862 cwt.; to Marseilles, 38; to Trieste, 419; to Hamburg, 6955; to Antwerp, 3189; to Bremen, 1012; to India, 82, and to the United States, 98,914—altogether, 164,471, against 172,413 in 1887; 133,564 in 1886, and 127,003 in 1885. *Coir Yarn*, Nos. 1 to 4 may be quoted 7 to 12 rupees $\frac{1}{2}$ cwt. *Exchange*, six months' 1/4 7-16.—*Volkart Brothers.*

PENANG, June 9, 1888.—*Tin*.—While the demand for Europe and America has ceased altogether, China, on the contrary, has taken 6500 piculs. There was a decline from \$34.75 $\frac{1}{2}$ picul to \$34.10, followed by a recovery to \$34.60, winding up to-day at \$34.50. Receipts for the fortnight summed up 7500 piculs, and there are only left unsold in bazaar 50 tons. Some of the shipments to China were made for smelters' account. During the first five months shipments from here have summed up 76,072 piculs to England, against 63,571 same time last year; to the Continent, 338, against 815, and to the United States 485, against 9682. *Gum Benjamin* may be quoted: No. 1, \$34 @ \$39 $\frac{1}{2}$ picul, and No. 2 \$30 @ \$50; prime *Gutta Percha*, \$60 @ \$100, and *India Rubber*, \$70 @ \$75. *Exchange*.—Four months' bank, London, 3/0 $\frac{1}{2}$.—*Schmidt, Kustermann & Co.*

SINGAPORE, June 2, 1888.—*Silver Coin*.—A strong movement is on foot to induce the home government to coin a British Silver dollar to

circulate in the Straits Settlements and Hong-Kong in the place of the Mexican dollar; the latter, though it has full weight, wears off rapidly, is rough-looking, and entails a dependence on Mexico frequently of an annoying kind. Since the failure of the Hong-Kong mint all agree that it would be useless to try to prevail on the home Government to make another experiment of the kind and create a Colonial mint, but it may not object to the British mint coining such dollars of the fineness and weight of the Mexican for circulation here, at Hong-Kong and China. While the Hong-Kong Chamber of Commerce is ready to support the project, the Hong-Kong Colonial Government declines to favor it, because in its opinion the British dollar cannot be produced as cheaply as the Mexican. Yet France and Spain have taken steps to coin dollars for their East India colonies.—*Straits Times.*

MANILA, July 16, 1888.—*Hemp*.—Has been steady during the week at \$8.62 $\frac{1}{2}$ $\frac{1}{2}$ picul as compared with \$7.75 last year. These quotations equal $\frac{1}{2}$ ton, cost and freight, £28. 12/6, against £26. 14/4; cleared for the United States, since last cable, 2000 bales, against none; ditto since January 1, 99,000 bales, against 123,000; loading for ditto none, against 13,000; cleared for England since January 1, 186,000, against 112,000; loading for ditto 22,000, against 23,000; cleared for all other countries, 42,000, against 22,000; receipts at all ports since last cable, 9000, against 8000; since January 1, 323,000, against 250,000 in 1887, and 200,000 in 1886. *Freight*, \$5.50, against \$5. *Exchange*, 3/5 $\frac{1}{2}$, against 3/5 $\frac{1}{2}$.—*Ker & Co. to Charles Nordhaus, New York, per cable direct.*

CALCUTTA, July 9, 1888.—*Jute*.—The market has remained steady during the week. In new crop Jute a steady, moderate business is being transacted daily, the bulk being for shipment via canal in August and September, either to London or Dundee. The amount shipped to the latter is considerably less than the previous months; it seems that the higher prices cause this falling-off. There is for the present little prospect that prices will drop all of a sudden, hence our balers are by no means anxious sellers. The first receipts of new are likely to be bought up by the East India spinners. These will stand in need of a supply in August. As at the same time bales sold extensively, August delivery of new Jute, there is going to be a sharp competition, which will not favor a decline during that month. The old crop supplies being exhausted on all hands, all consumers are eager to get the new jute; indeed, everything seems to point rather to higher than lower prices at the opening of the campaign. Week's sales, 50,000 bales at 24 $\frac{1}{2}$ @ 27 $\frac{1}{2}$ rupees. Now balers ask more, and in a few instances have got it. Many orders from abroad have remained unexecuted. The weather is all that can be wished for to propitiate the new crop. Rains have been general without being too heavy anywhere.—*Times of India.*

SINGAPORE, July 15, 1888.—*Tin*.—Exports from here and Penang to the United States during the fore half of the present month have amounted to 150 tons, against 100 last year; to England, 200, against 500. Since January 1 they were respectively 1000, against 2700, and 19,200, against 7100.—*Giffillan, Wood & Co. to Charles Nordhaus, New York, per cable direct.*

SPAIN.

BILBAO, July 7, 1888.—*Iron Ore*.—Business has been resumed by the purchase of several single cargoes at 7/6 @ 8/ for Campinil, and 6/10 @ 7/3 Rubios. Since February, the demand for our Ores has fallen off considerably, some 400,000 tons. Since January 1 there have been shipped 1,965,633 tons, against same time last year 2,350,805. *Pig Iron*.—For export, 3875 tons were shipped during the week, and coastwise 1096. The spot price of the latter is 57 @ 60 pesetas f.o.b. here $\frac{1}{2}$ ton, and futures are worth 55 @ 58; "Lingotillo" at Huelva or Seville, 65, all quotation of the "Vizcaya Company."—*Bilbao Marítimo y Comercial.*

SWEDEN.

STOCKHOLM, July 12, 1888.—*Iron*.—The Government will not yet allow the new duty of 80 oere $\frac{1}{2}$ 100 kg. on Pig Iron (about 1 $\frac{1}{2}$ $\frac{1}{2}$ American), to become operative, because for the time being it will afford no protection whatever to Swedish blast furnaces, but on the contrary would prove unwelcome to machine shops and foundries, so long as these remain unprotected by reason of the Franco-Swedish treaty of commerce. Should France consent to a modification of the latter, the way would be smoothed for a protection of Swedish Iron industry, and Parliament may then act accordingly.—*Dagbladet.*

GERMANY.

HAMBURG, July 14, 1888.—*Iron*.—Business revives slowly in Rhenish-Westphalia from the interruption it suffered during stock-taking. There has been less of an export demand for

Spiegel ever since May, when it was active. Domestic consumers continue taking the same steadily. The fact is that in consequence of dear raw material competition abroad has become difficult. Siegen quotes 10 to 12 $\frac{1}{2}$ 57. The quotation there for prime Forge Pig is 48 @ 49, at Siegen, and 50 @ 52 elsewhere; Luxembourg, 38.70 marks; all $\frac{1}{2}$ ton. English Bessemer is steady at 42/6. Finished Iron is quiet; the rolling mills have booked orders to last them for a couple of months. The domestic demand for Hoop Iron has improved, but it does not suffice, hence sacrifices have to be made to get rid of the excess on hand by consigning it abroad. Thin Sheets are dull still. Wire Rods have been placed more readily at home, but the American demand is slack still. Machine shops and foundries continue doing tolerably well. Car works are very busy. *Lead*.—At a general meeting of Spanish, German, English and French lead producers, recently held at Paris, the question was discussed most thoroughly what could be done to place the European Lead markets permanently, if possible, on a sounder basis. A committee of three was appointed to submit to another general meeting soon to come off a series of resolutions to be elaborated by the same. The committee was ordered to study particularly whether there is an approximate equilibrium between production and consumption; if it should be found that there is an excess of production, the committee is to suggest to what extent the latter ought to be curtailed. Finally, the meeting gave it as its opinion that the sale of European Lead should be concentrated in one hand in the future. *Sewing Machines*.—Manufacturers of and dealers in Sewing Machines in Germany have petitioned Parliament to raise the duty from 3 marks $\frac{1}{2}$ 100 kg., to 60 marks on the machines and 15 marks on the stands; the import was 18,435 metrical cwt. of 100 kg. in 1887, against 25,354 in 1886, and 26,848 in 1885; the amounts from the United States having been respectively 16,935, 21,840 and 24,358; and from Austria, 1864, 1844, and 1386. The export of German Sewing Machines was on the other hand 64,237 cwt. in 1885, 67,758 in 1886, and 73,473 in 1887. The impression at Hamburg is that under the circumstances it would have been wiser to let the subject rest where it is.—*Borsenhalle.*

The Vestibule Law Suits.—In the United States Circuit Court at Chicago two weeks ago, Judge Gresham and Blodgett granted the motion of the Wagner Palace Car Company to modify the preliminary injunction issued last month in the vestibule car case between the Wagner and the Pullman companies. The effect of the decision is that the injunction is dissolved, and the Wagner Company is at liberty to use the vestibule platform as originally constructed. By this action all proceedings in the litigation are stopped until the matter can come up for trial in the regular way, which will probably not be for over a year. In the meantime the Wagner Company give bonds.

The North Chicago Rolling Mill Company started up part of their Bay View Works at Milwaukee, Wis., on the 19th inst., having signed the scale. In reply to inquiries they state that for some time they will not run their puddling furnaces on metal direct from the blast furnace, as they have an accumulation of pig iron on hand which will first be disposed of. The resumption of direct puddling will depend upon the condition of trade, as the pig iron in stock may last for several months if the demand for finished iron is not more active. When it is cleaned up direct metal will again be used, as the results obtained with it in the first half of the year were very satisfactory.

The Postmaster-General has received official notice that the South American Steamship Company of Chili have been subsidized by the Chilean Government to establish a fortnightly service between Valparaiso and the Isthmus of Panama, to connect with the Pacific Mail Steamship Company to and from New York. The fleet of the South American Steamship Company consists of 18 large steamships, which are commanded principally by Americans. The subsidy is \$250,000 per annum.

TRADE REPORT.

Philadelphia.

Office of *The Iron Age*, 220 South Fourth St.,
PHILADELPHIA, Pa., July 24, 1888.

The general tone of the market seems to have improved during the past week, although upon a careful investigation Pig Iron appears to be the only article that shows genuine strength. This is probably due to the resumption of work at mills in the West, as most of them had cleaned up their stocks in anticipation of a more or less protracted lockout, and as they are now starting up they all require material to go on with, hence the active demand. It is not clear, however, that this signifies that the turning point in the market has been reached. Finished Iron is not as firm as it was two or three weeks ago, and, paradoxical as it may seem, for the same reason that Pig Iron is firmer. Pig Iron weakened on prospect of decreased consumption while Finished Iron strengthened on prospects of a decreased production, so that now the position is again reversed. Of course it is quite possible that a firmer and more active market may be developed along the entire line—we are rather inclined to believe that this will be the case—but as yet there are no positive indications of such an event, so that in the meantime it is all a matter of opinion.

Pig Iron.—As already stated, the market is firmer. A great deal of Iron has been bought during the past couple of weeks, and a continuance of the demand on a similar scale, and for a similar time, would probably lead to higher prices. The probabilities are, however, that the most needy buyers have covered their requirements for the next 30 or 60 days, and that the demand for some time will be of the usual routine character. Meanwhile large consumers are likely to watch the market closely, and if the indications point to a larger consumption than was met with during the first half of the year orders will be pretty sure to come in at a rate that will start prices on the way to a somewhat higher level. As far as we can learn the chances of an increased production are not very strong, as there is no money in the business at present prices. Three or four new furnaces in the South may be "blown in" some time before the middle of September, but they are not likely to exercise any material influence on the market, unless consumption proves to be smaller than the trade anticipates. Taking the market as a whole, there appears to be a possibility of somewhat higher prices as the season advances, while there is no probability of a movement in the opposite direction. This we believe fairly represents the feeling of the trade today, and is apparently fully warranted by recent developments. The excitement and uncertainty attending a Presidential election are not favorable for any very pronounced changes, but, when that question is finally settled every one expects a more active business. Prices of Pig Iron tide-water delivery may be quoted firm at the following prices, say: No. 1 Foundry, \$18 @ \$19; No. 2, do., \$17 @ \$17.50; Gray Forge, \$15.75 @ \$16. Southern Irons are not offered here to any extent, but could probably be bought ex-ship at \$1 below Pennsylvania or Western makes, but they are not sought for, unless at low figures. A 2000-ton lot of Tennessee Iron was sold for Pipe making at something less than \$14.50, but the transaction was somewhat exceptional in its terms, &c.

Foreign Iron.—Prices are entirely nominal, as there is no demand, and no inquiries likely to lead to business at present. Asking prices are as follows:

Bessemer, \$19 @ \$20, c.i.f., duty paid, and 20 % Spiegel, \$26 @ \$26.50.

Blooms.—Business is rather quiet, but Steel moves fairly in small lots. Prices about as follows: Slabs and Billets from \$29 to \$35, f.o.b. cars at mill, according to analysis; Charcoal Blooms, \$52 @ \$54; Run-out Anthracite \$42 @ \$44; Scrap Blooms, \$34 @ \$35 per "bloom" ton of 2464 lb. Foreign at tide, c.i.f., duty paid, \$29 @ \$30 for Nail Slabs; \$31.50 @ \$32.50 for 4 x 4 Billets, and \$35 @ \$39 for Siemens-Martin, price according to analysis, &c.

Muck Bars.—The demand is improving, and sellers find the market about 50¢ per ton in their favor. Sales during the week have been made at \$27 @ \$27.50, delivered, with a general disposition to hold for the outside figures.

Bar Iron.—There is a somewhat heavier demand, but it is more than offset by the increased number of sellers. Prices are, therefore, more uneven than they have been for several weeks past, which in the majority of cases means lower prices. Mills are busy and can run two or three weeks on such orders as they have on their books, but beyond that there is some anxiety to secure new business. Competition is closer than ever, and the worst of it is that those making strictly first-class Bars have to bid against some who use a mixture of old rails and other cheap material. In one instance we hear of what was claimed to be a first-class quality of Bars offered at less than 1.7¢, delivered, but it is doubtful if anything strictly up to requirements could be had for less than 1.8¢, although some people seem to be willing to run the risks of a guarantee, even if what they furnish is not up to the standard. For this reason it is almost impossible to quote prices correctly, because, while 1.8¢ @ 1.85¢ is the usual quotation, some offer large lots at a great deal less. Skelp Iron is also a shade lower, although there is a better demand, and some good-sized lots have been taken at from 1.75¢ to 1.8¢ delivered.

Plate and Tank Iron.—The demand is fairly active and mills are nearly all busy for the present. Orders for fall delivery, however, could be readily placed at the low rates quoted some time ago, although for small lots early delivery prices are well up to the asking rate. The outlook is not specially discouraging, although for the present there is very little in sight beyond the ordinary routine demand. Asking prices about as follows: Ordinary Plate and Tank Iron, 1.95¢ @ 2.05¢; Shell, 2.4¢ @ 2.5¢; Flange, 3.5¢; Fire-Box, 4¢; Steel Plates, Tank and Ship Plate, 2.3¢ @ 2.4¢; Shell, 2.7¢; Flange, 3¢ @ 3½¢; Fire-Box, 3½¢ @ 4½¢.

Structural Iron.—A good demand for small lots is reported and the mills are kept fairly employed on this class of business. The outlook is not particularly bright, but manufacturers express themselves somewhat hopeful of the fall trade, although with such a large capacity it will require a heavy demand to keep all the mills busy. Prices are unchanged, although it is said that Angles are steadier than they were some time ago. Quotations about as follows: 2¢ @ 2.10¢ for Bridge Plate; 2¢ @ 2.10¢ for Angles; 2.6¢ @ 2.7¢ for Tees, and 3.3¢ for Beams and Channels, Iron or Steel.

Sheet Iron.—A moderate amount of business is reported and at steady prices for the best makes, but there is a good deal of inferior stuff offered at low figures. Standard makes are quoted as follows for small lots:

Best Refined, Nos. 26, 27 and 28....3½¢ @ 3½¢
Best Refined, Nos. 18 to 25.....3 @ 3½¢
Common, ½¢ less than the above.
Best Bloom Sheets, Nos. 26 to 28....4½¢ @ 4½¢
Best Bloom Sheets, Nos. 22 to 25....4 @ 4½¢
Best Bloom Sheets, Nos. 16 to 21....3½¢ @ 3½¢

Blue Annealed.....2.8 @ 3 ¢
Best Bloom, Galvanized, discount.....62½ ¢
Common, discount.....67½ ¢

Merchant Steel.—Fine Tool Steel has been in good demand during the past week, and several large sales have been made, while for cheap Steels there has been considerable inquiry, but very little in the way of immediate business. Prices for lots from store are quoted as follows: Tool Steel, 8½¢; Machinery, 2½¢; Crucible Spring, 4½¢; Open-Hearth Ordinary Spring, 2½¢ @ 2½¢; Crucible Machinery, 5¢; Best Sheet Steel, 10¢; Ordinary Sheet, 8¢.

Steel Rails.—There is very little doing, and at \$30 only small lots are taken. Mills in this vicinity claim that it would require to be a very desirable order to secure attention at a very low figure, although it is believed that several orders have been taken at less money by mills in the West. Still \$30 at mill is the usual asking price for the present.

Old Rails.—The few lots that are here are held above the market, say \$21.50 @ \$22 in store. Buyers for small lots could be found at about \$21, f.o.b. cars, but sales are chiefly at about \$21.50 @ \$22 delivered at mills in the interior.

Scrap Iron.—Market very dull, and prices feverish and irregular. Small lots of good quality command about the figures quoted a week ago, but the market will not bear much pressure: \$18 @ \$19 for cargo lots; \$20 @ \$21 for carload lots, delivered, or for choice \$21.50 @ \$22; No. 2 do., \$14 @ \$15; Turnings, \$13 @ \$14; Old Steel Rails, \$19 @ \$20; Cast Scrap, \$14 @ \$15; do. Borings, \$9 @ \$10; Old Fish Plates, \$24 @ \$25. Old Car-Wheels, \$17 @ \$18, Philadelphia, or its equivalent.

Wrought-Iron Pipe.—Contrary to all expectations the improving condition of trade in this department noted last week continues, and manufacturers feel confident of a fair business from this time on. Discounts are quoted as follows: Black Butt-Welded 55 ¢; on Galvanized do., 45 ¢; on Black Lap-Welded, 65 ¢; on Galvanized do., 52½ ¢; on Boiler Tubes 60 ¢.

Nails.—Trade is hesitating and there is absolutely nothing of interest to note. The small amount of business being transacted consists principally of small orders for city delivery. Price is nominally \$2.05 from store, with the usual discount for carload lots.

Chicago.

Office of *The Iron Age*, 95 and 97 Washington St.,
CHICAGO, July 23, 1888.

Pig Iron.—An increased volume of business is reported, but trade cannot yet be called active. The inquiries received cover a very large quantity in the aggregate, and if but half of them were to be placed, the complexion of the market would undergo a decided change. An attempt is being made to push prices up a trifle, but the effect is generally to turn buyers to brands which are still to be had at old prices. Both buyers and sellers are very conservative. The former are slow to make contracts ahead for any considerable time, and the latter insist that they prefer to sell only for reasonably easy delivery at present prices. The market is in a very sensitive condition just now and ready to respond to a decided influence in either direction. If the large purchases usually made at this time of the year should be speedily completed, the situation will be greatly improved for the furnace companies, and they will be able to maintain prices for the fall trade. Cash quotations are as follows, f.o.b. Chicago: Lake Superior Charcoal, all numbers, \$19 @ \$19.50; Alabama Car-Wheel, \$26.25;

Southern Charcoal Foundry, No. 1, \$18 @ \$19; Jackson County Softeners, No. 1, \$17.50 @ \$18; Hocking Valley, Soft Foundry, No. 1, \$16.50 @ \$17.50; American Scotch (Blackband) No. 1, \$18.25 @ \$19; other Ohio Scotch Irons, No. 1, \$17.50 @ \$18; Lake Superior Coke, No. 1, \$17 @ \$17.50; No. 2, \$16 @ \$16.50; No. 3, \$15 @ \$15.50; Southern Coke, No. 2, \$16.50 @ \$17; No. 2½ and Open Bright, \$16; No. 3, \$15.50; No. 1 Mill, \$15 @ \$15.50.

Bar Iron.—Opportunities are now offered by the Agricultural Implement trade for the sale of large quantities of Bar Iron, but agents are considerably hampered by the backwardness of their mills to get into good working trim, or by the indifference with which they regard contracts for very long delivery at present prices. The general demand is not very heavy, and competition is quite strong for the orders for early delivery now coming forward. Common Iron is still quoted from mill at 1.65¢, half extras, f.o.b. Chicago, but this can be shaded on some sizes. The stores report a very steady demand from small consumers at 1.90¢ @ 2¢.

Structural Iron.—The country demand for Beams is now better than the city trade, as building seems to be much more active in the outlying towns. Some good orders have been placed for Bridge work. Store prices range from 2.40¢ to 2.70¢ for Angles; 2.60¢ to 2.90¢ for Tees; 3.80¢ for Beams and Channels. From mill Angles are quoted, f.o.b. Chicago, at 2.20¢; Universal Plates, 2.25¢; Tees, 2.45¢; Beams, 3.40¢.

Plates, Tubes, &c.—The general demand for Plates has been very good, and plenty of orders are still in sight. Bids have been solicited for 1500 tons of Tank Steel for the West Side cable road. From store prices are as follows: Heavy Sheets, Nos. 10 to 14, 2.65¢; Tank Iron, 2.55¢; Tank Steel, 2.80¢; Shell Iron, 3¢; Shell Steel, 3.25¢; Flange Iron and Steel, 4¢; Fire-Box Steel, 4.75¢ @ 5.75¢; Boiler Rivets, 4¢ @ 4.25¢; Ulster Iron, 3.75¢; Boiler Tubes, 60 % and 10 % off on 2½-inch and larger and 62½ % off on 2-inch and smaller.

Sheet Iron.—No. 27 Common Black is still quoted at 2.95¢, f.o.b. Chicago, in carload lots, but inquiries have not been so numerous the past week, although it is believed that a considerable percentage of the larger buyers have not yet contracted for their season's supply. Jobbers are quoting 3.10¢ @ 3.20¢ from store, according to quantity, for No. 27, but this has been shaded under special circumstances.

Galvanized Iron.—Manufacturers' agents report a slight hardening of prices under the continued good demand, but the jobbers are now less firm, as they are receiving stocks bought at concessions some time since. Quotations for small lots are nominally 60 % and 5 % off for Juniata, and 60 % and 10 % off for Charcoal.

Merchant Steel.—Some Plow manufacturers have begun to place orders for Syndicate Steel, but they strongly protest against the rate of 7½¢ @ 9¢ lb, f.o.b. Pittsburgh, which they insist is too high. The demand from the general trade has been light for several days. Quotations from store are as follows: Bessemer Bars, 2.30¢ @ 2.50¢; Tool Steel, 8½¢ @ 9½¢; Specials, 13¢ @ 25¢; Crucible Spring, 4.40¢; Open-Hearth Spring, 2.90¢; Open-Hearth Machinery, 2.75¢ @ 3¢; Crucible Sheet Steel, 7¢ @ 11¢.

Steel Rails.—The condition of this branch of trade shows no change, manufacturers anxiously awaiting a turn in the tide. Only small orders are being received, ranging from a few carloads to a few hundred tons, on which prices still range from \$32 to \$32.50.

Old Rails and Wheels.—Old Iron Rails are reported higher. A sale of 200 tons was made early in the week at \$18.50, but later \$19 was refused, railroad companies insisting that they were worth from \$19.25 to \$19.50. Old Car-Wheels are very quiet. They are probably worth about \$18.50.

Scrap.—The supply is very abundant, but sellers are not so weak as they were, anticipating an early demand from the rolling mills now starting into operation again. An exception is found in the lowest grades of Scrap, which are to be had at slightly easier prices. Some sales of Wrought are reported, but the quantity was not large. Mixed Country Scrap is now quoted at \$11 @ \$11.50. Selling quotations for carefully selected are as follows, per ton of 2000 lb: No. 1 Forge, or Railroad Shop, \$17 @ \$18; Track, \$16.50; No. 1 Mill, \$13; Light Wrought, \$9; Horseshoes, \$16.50; Axles, \$22; Cast Machinery, \$12.50 @ \$13; Stove Plate, \$9; Cast Borings, \$8.25; Wrought Turnings, \$10; Axle Turnings, \$12; Coil Steel, \$13.50; Leaf Steel, \$14.50; Locomotive Tires, \$15.

Hardware.—The demand for Shelf Hardware is unusually good for this time of the year. It very seldom happens that night work is necessary to dispose of a rush of orders in midsummer, yet that has recently been the experience of some of the leading houses in this city. While the demand is of a general character, all classes of goods moving very freely, an especially heavy trade is noted in Grain Cradles, caused by the difficulty encountered in using machinery in fields of grain beaten down by the severe storms. Carriage Bolts have now settled down to 75 ¢ off, but no other changes in prices worthy of notice have been made. Collections are always light in the harvest season, but they are fully up to expectations. Heavy Hardware is moving a little more slowly, but a good demand is experienced from manufacturing consumers.

Nails.—Manufacturers' agents have made some good sales of Steel Nails to parties who believe they are a good purchase at the terms, although the consumption is very light at present and the demand does not warrant the laying in of large stocks. The price of large lots from factory is now quoted at \$1.90 @ \$1.92½, f.o.b. Chicago, but special terms are made on almost every sale, according to specifications, &c. Jobbers' quotations are \$2.05 for small lots of Steel Nails, and \$2.50 @ \$2.60 for Wire Nails, but prices are weak under the slow demand and concessions are made when necessary.

Barb Wire.—The demand is very light. Manufacturers are piling up Wire in their warehouses and many of them are preparing to shut down on the 1st of August for repairs, the dullness of the trade being a strong inducement to the suspension of operations for a longer period than usual.

Pig Lead.—Quite a healthy consumptive demand is noted in this market. Sales reported for the week aggregate 700 tons at prices ranging between 3.80¢ and 3.85¢, closing with a feeling of slight weakness resulting from lower prices in Eastern markets.

Copper.—Buyers display much timidity in making contracts involving any considerable quantity of material, evidently fearing a collapse in prices by the culmination of the foreign speculative syndicate's plans. Negotiations of importance are pending, but prices are firmly maintained at former rates.

Chattanooga.

Office of *The Iron Age*, Carter and 9th Sts.,
CHATTANOOGA, July 23, 1888.

The prospect of good crops throughout our entire South was never better at this season of the year. Many of them are be-

yond any probable contingency. Should cotton bear out indications this year will be another one added to prosperous years of the South. Neither have the manufacturing interests anything to complain of. None of those that have been started on any thing like a sound basis have shown any backward movement, but, on the contrary, have been gaining in financial strength and in many cases have added largely to their capacity.

Pig Iron.—The status of the market of this article appears to remain about the same as last reported, and the general expression appears to indicate that there is a feeling that prices will go no lower. Among some large consumers there appears to be a desire to make contracts to extend through the balance of the year, but which most of the furnaces are disinclined to do. There has been no disposition on the part of buyers to ask for lower figures. They appear to be satisfied if they can purchase round lots at present prices. There is still a perceptible scarcity of good Foundry grades, and some of the stacks are not quoting to new customers, as their make is wholly absorbed by those who have been taking their output regularly. Foundries through the South are gradually increasing their consumption, which is getting to be a matter of considerable importance to some of the stacks that have been giving this market their special attention. Forge grades may be said to be in better demand, and for the past week or ten days there has been quite a spirited movement of these Irons. Upon the whole the outlook is a little improved since the last report.

Cleveland.

CLEVELAND, July 23, 1888.

Iron Ore.—All dealers in Bessemer Ores report the season's output nearly disposed of. Prices have slightly strengthened, a 50,000-ton lot of Menominee Bessemer having been sold during the week at \$5, whereas the same Ore could have been bought three weeks ago for \$4.75. The very best grades of Ore did not maintain their fixed prices, sales having been made at \$5.75 for the most valuable Ores obtainable. Lake freights have also advanced, the rate from Ashland being \$1.25; from Marquette, \$1.15, and from Escanaba, 90¢. These changes are incidental to the close of every season's sales. Bessemer Hematites seem to have sold more freely than any other grade of Ore, dealers being quite unable to supply present demands. Gogebic Bessemer have sold with so much freedom during the past two weeks that there are really but small lots left for sale. The season's shipments from upper lake ports slightly exceed 1,525,000 tons, against 1,750,000 tons up to a corresponding period last year.

Pig Iron.—Buyers are purchasing liberally. Transact ons embrace considerable Iron for future delivery in round lots. Charcoal Irons have been in especial good demand during the past week. The inquiry for Bessemer Iron has been active and prices have been fully maintained. The following quotations are reported today:

No. 1 to 6 Lake Superior Charcoal.....	\$20.50 @ \$21.50
No. 1 Strong Foundry, Bessemer quality, per ton.....	17.25 @ 18.25
No. 1 Strong Foundry, per ton.....	17.00 @ 17.75
No. 2 Strong Foundry, per ton.....	16.00 @ 17.00
No. 1 American Scotch, per ton.....	17.50 @ 18.00
No. 2 American Scotch, per ton.....	16.50 @ 17.00
No. 1 Soft Silvery, per ton.....	17.50 @ 18.50
Mahoning and Shenango Valley Neutral Mill Irons, per ton.....	@ 14.75
Mahoning and Shenango Valley Red Short Mills, per ton.....	@ 15.25

Old Rails.—The sale of a small lot of Old Americans at \$21.50 constitutes the week's business. Old Wheels are quoted nominally at \$19.50, and there is still a demand for Selected Axles.

Nails.—Steel Wire Nails at \$2.60 are still selling freely. Iron Nails are quoted at \$1.90, and Steel Nails at \$2.

Coke.—Heavy sales have been made during the past week at the rate of \$1 per ton at the ovens.

Cincinnati.

CINCINNATI, July 23, 1888.

Pig Iron.—There has been a more urgent demand for both Mill and Foundry grades, especially for long forward deliveries, but there has also been more buying for the near months. Furnaces, while indisposed to sell except at an advance, have taken some orders of moment at last week's figure, the deliveries of which embrace the rest of the current year. Rolling mills, now that they have settled their strife with the Ironworkers, have been in the market for large amounts, and there have been sales here of between 10,000 and 15,000 tons of Forge Iron. Stocks of Iron have continued to decline, and upon this both sellers and buyers base their opinions of improvement in the future. The new furnace blowing in, in the South, will probably increase the general output, as compared with the consumption, but little. The off grades of Mill Iron have been well cleaned up, and the market has improved correspondingly; in fact, the market for Mill Iron is now relatively in its normal condition. While the aggregate volume of business has continued to increase the individual sales have not been large. No. 2 Southern Coke Foundry Iron has sold at \$15.50, and at the close furnaces are not ready sellers under \$16; No. 24 Foundry has been sold at \$15 @ \$15.25. No. 2 Mill has been sold on the basis of \$18.50, and No. 1 at \$14.25, and there have been a few transactions within 25¢ of this rate. One thousand tons of Lake Superior Car-Wheel Iron sold at about \$20.50 here. Prices current here, cash, f.o.b., are approximately as follows:

Hot-Blast Foundry.

Southern Coke, No. 1.....	\$16.50 @	\$17.00
Southern Coke, No. 2.....	15.50 @	16.00
Southern Coke, No. 3.....	15.00 @	15.50

Southern Car-Wheel.....	20.00 @	23.00
Hanging Rock, Cold Blast.....	22.00 @	25.00
Lake Superior Car-Wheel and Malleable.....	20.50 @	21.50

Manufactured Iron.—The manufacturers' Association have practically withdrawn from the contest with the Amalgamated Association, and all those who have not signed the scale will probably do so during the present month, although several of the mills will hold out until the repairs have been fully completed. There has been a more active demand for manufactured Bar and Plate Iron at about rates current before the strike. Bar and Sheet Iron—Common Bar Iron, 1.90¢ @ 2¢; Charcoal Bar Iron, 2.90¢ @ 3¢; Sheet Iron, Boiled, Nos. 10 to 27, 2.50¢ @ 3.25¢; Sheet Iron, Charcoal, Nos. 15 to 25, 3.4¢ @ 4.4¢ per lb.

Nails.—There has continued to be a fair jobbing demand for both Iron and Steel Nails, and moderate sales have been made from the mills at about 15¢ under the quoted jobbing prices, which are based upon 12d @ 40d, which sell at \$2 per keg, with 10¢ rebate in carload lots at mills; 50d @ 60d, 25¢; 10d, 10¢; 8d @ 9d, 25¢; 6d @ 7d,

40¢; 4d @ 5d, 60¢; 3d, \$1, and 2d \$1.50 per keg more. Steel Nails sell at \$2 and Steel Wire Nails at \$2.65 @ \$2.75 per keg.

Old Material.—There has been but little change in the market, and moderate sales of Old Rails have been made at \$19.50 per ton and Old Wheels at \$18.50 per ton spot cash at Cincinnati, or equivalent to such rates.

Louisville.

LOUISVILLE, KY., July 23, 1888.

Pig Iron.—Sales of Iron in lots of from 300 to 500 tons continue to be made at prices current last week. There is a decided feeling on the part of nearly all the buyers that bottom has been reached, and though it is not expected that much of an advance will take place, prices will probably advance from 25¢ to 50¢ a ton, and it is thought a good time to buy. The disposition on the part of furnacemen not to sell for long delivery is increasing, and the more conservative furnaces are offering Iron only for from 60 to 90 days. Sales of Southern Iron have been made East by a Louisville house during the last week at prices fully 50¢ a ton higher than the same would bring in the Louisville market, and it is evident that prices must readjust themselves in the West, or else Iron will be shipped East in large quantities. We think it looks more favorable than at any time this year for large sales, and at prices better than those recently current.

Pittsburgh.

Office of The Iron Age, 77 Fourth Ave.,
PITTSBURGH, July 23, 1888.

While the Iron lockout is virtually over, there is a great deal of dissatisfaction manifested on the part of manufacturers generally; they consider that they are not being treated fairly by the Amalgamated Association, in having to pay more than Eastern manufacturers, with whom they have to compete. A number of Iron firms, both here and elsewhere, have not yet signed the scale, nor is it likely that they will until they are ready to start up their mills, in regard to which they do not appear to be in any especial hurry. In some respects, however, the outlook is favorable. Crop reports are generally encouraging. This, to some extent, will offset the discouraging effects of the political excitement of the Presidential campaign as well as the tariff agitation.

Pig Iron.—There has been a largely increased volume of business during the past week, consequent upon the starting up of a number of the mills, and the market, as might be expected, has stiffened up. Consumers, who two weeks ago would not think of buying, are now at least willing to talk on the subject; some of them have bought pretty freely already, and others are anxious to do so. They all made it a point to close down June 30 with as little stock as possible, and, being apprehensive of an advance, it is not strange that they are wanting to buy both for present and future delivery; moreover, there have been some sales on speculation, and it is evident that those of a speculative turn are of the opinion that prices will go higher, otherwise they would not buy. However,

there is not likely to be much of a boom, as there is nothing in the market for finished stuff to warrant it; even now it is claimed that the raw material is bringing all it is worth to consumers, when the price of Finished Iron is taken into consideration, and if this is the case no material advance in the former can reasonably be expected, although there are those who argue that it will go considerably higher, and that it will take Finished Iron up with it. Some of the sales reported show an advance of 25¢ per ton, and some furnacemen are refusing to make additional sales at rates now current. The sales reported during the week under review exceed 20,000 tons, the great proportion of it Gray Forge, chiefly at \$14.25, cash, with some few sales at \$14.40 @ \$14.50. Bessemer may be quoted at \$17.50 @ \$17.75, four months, with sales of several lots reported at \$17.25 @ \$17.30, cash. We quote prices as follows:

Neutral Gray Forge.....	\$14.00 @	\$14.75, 4 mos.
All Ore Mill.....	15.50 @	16.00, "
No. 1 Foundry.....	16.75 @	17.00, "
No. 2 Foundry.....	15.75 @	16.00, "
No. 3 Foundry.....	15.00 @	15.25, "
Charcoal Foundry.....	22.00 @	24.00, "
Cold Blast Charcoal.....	25.00 @	28.00, "
Bessemer.....	17.50 @	17.75, "

Muck Bar.—There is more doing, but prices remain unchanged. We can report a sale of 1000 tons at \$26, cash, and 750 tons at \$26.75, cash, the latter delivered at works of the buyer. The demand has improved considerably during the past week.

Manufactured Iron.—Now that the strike is virtually over, and the mills are resuming business, there is no longer any apprehension of a scarcity of stock, and the tone of the market, by reason of an increased production, is easier. Some firms have not yet signed the scale, and their mills are still standing idle, but all orders are now readily accepted, and buyers have no longer any apprehension about getting their wants promptly supplied, and that, too, within the range of our quotations. We continue to quote Bars at 1.70¢ @ 1.80¢; Plate Iron, 2.15¢ @ 2.20¢; No. 24 Sheet, 2.70¢ @ 2.80¢, all 60 days, with usual discount of 2 % off for cash.

Nails.—There is no improvement to note in the Cut-Nail trade. Demand continues light for the season and prices continue unsettled and unsatisfactory. Pittsburgh manufacturers are still holding for card rate, \$1.90, 60 days, 2 per cent. off for cash, in car lots, but they are getting very few orders. It is said that some manufacturers not very far west of Pittsburgh are selling at \$1.75 @ \$1.80; hence there is not much chance for the Pittsburgher unless he meets the price which he is refusing, claiming that it is better to do nothing than to work for nothing.

Wrought-Iron Pipe.—Buyers continue to have it pretty much their own way and manufacturers continue to report the market just about as mean as it can be. There is nothing like the business there was a year ago, but there is a possibility that the fall trade may pan out better than most people expect, as there is often a change for the better unexpectedly. That there is so little doing is accounted for by the fact that natural gas and oil development is very light as compared with what it was a year ago, while the capacity for making Iron Pipe has been considerably increased, several new mills having been completed within that time. It is impossible to quote prices as long as the market remains in its present go-as-you-please condition—every fellow for himself. Some manufacturers are indifferent about getting business, claiming that there is nothing in it at ruling prices.

Old Rails.—There has been very little business the past week, but, with the mills starting up, an increased demand is

looked for. A sale was reported two weeks ago at \$20.75, and there are buyers now at \$20.50, cash, but no sellers. It is doubtful whether a seller for American Tees could be found under \$21, as the supply is small and there are but few offering. The railroads centering here have but few for sale, and the same appears to be the case elsewhere.

Steel Rails.—Are still quoted at \$31 @ \$31.50, cash, delivered on cars at mill here, but it is intimated that for a desirable order the inside quotation would be shaded. The Edgar Thomson Works are busy, working up well to full capacity, but it is chiefly on orders booked some time ago.

Billets, &c.—There is a continued fair demand for Bessemer Steel Billets, which we continue to quote at \$28 @ \$28.50, cash, as to size, quality, delivery, &c. Nail Slabs remain unchanged at \$27.75 @ \$28, with but little inquiry. Sale 500 tons Domestic Bloom Ends at \$17.50, cash, and 250 tons Domestic Crops at \$17.25.

Railway Track Supplies.—Trade continues light, while prices remain about as last quoted: Spikes, \$2 @ \$2.10, 30 days, delivered; Splice Bars, 1.75¢ @ 1.85¢; Track Bolts, 2.85¢ with square, and 2.95¢ with hexagon nuts. It may be that a desirable order would be placed below our quotations.

Merchant Steel.—There is no improvement in the demand and no change in prices. Best brands of Tool Steel, 8½¢; Crucible Spring Steel, 4½¢; Crucible Machinery Steel, 5¢; Open-Hearth do., 2½¢.

Old Material.—We can report a sale of No. 1 (railway shop) Scrap, at \$19, net ton; Old Car Axles are quoted at \$23 @ \$24; Cast Scrap, \$15 @ \$15.50, gross; Cast Borings, \$11.50 @ \$12; sales 200 tons Scrap Steel, at \$17.

New York.

Office of *The Iron Age*, 66 and 68 Duane street, New York, July 26, 1888.

American Pig.—There is little change to be noticed in the Pig-Iron market, which continues very dull with no new business offering. It is remarked, however, that those who purchased early in the year for future delivery are taking Iron more freely now than heretofore. This delayed delivery of Foundry Pig is due to the fact that the foundries have been using considerable quantities of Southern Iron and have consequently put off delivery of Northern brands. The Lehigh furnaces are carrying very heavy stocks, but there is no weakening in price. Southern Iron may be quoted \$17.50 @ \$18 for No. 1, and \$16 for No. 2, delivered in New York. We quote standard and choice Northern Irons, tide-water delivery, as follows: \$18 @ \$18.50 for No. 1 Foundry, \$16.50 @ \$17.50 for No. 2 Foundry and \$14.75 @ \$16 for Gray Forge.

Scotch Iron.—The Scotch-Pig market is quiet and dull, and the slight advance in Glasgow is not felt here. We quote: Coltness, \$19.50 @ \$19.75; Summerlee, \$19.25 @ \$19.50; Langloan, \$19 @ \$19.50, and Dalmellington, \$18 @ \$18.50 for large to small lots.

Bar Iron.—The volume of trade is slightly improved, quotations for carload lots, half extras, on dock, being 1.60¢ @ 1.65¢ for Common Iron, 1.7¢ for Medium, and 1.8¢ for Refined, with special qualities selling up as high as 2¢ @ 2½¢.

Plates.—We quote: Tank, 1.9¢ @ 2¢; Shell, 2.15¢ @ 2.30¢; Steel Tank, 2.4¢ @ 2.5¢; Shell, 2.15¢ @ 2.25¢; Flange, 2.6¢ @ 2.75¢, and Fire-Box, 3¢ @ 3.25¢.

Structural Iron.—We quote: Bridge Plates, 1.9¢ @ 2¢; Universal Mill Plates, 2¢; Angles, 2¢ @ 2.2¢; Tees, 2.5¢ @

2.7¢, and Channels and Beams, 3.3¢, on dock.

Steel Rails.—There is absolutely nothing doing in Steel Rails. There are a number of inquiries in the market, but no business is done. The market is undoubtedly weak, but, as there are no sales, prices remain unchanged. On an exceptionally good order current quotation would very likely be shaded, but, as it is, the price remains nominally \$30 for moderate lots at Eastern mill. The passage of the Mills bill through the House has perhaps influenced the views of buyers somewhat, but otherwise has not affected the market.

Old Rails.—There is nothing new to report, \$20 being bid here, but with only sales of small lots at this figure.

Scrap.—The market is dull at unchanged prices. We note a sale of 200 tons American No. 1 Wrought Foundry Scrap at \$22, but what little trade there is mostly confined to small lots. Foreign Scrap is quoted at \$19 @ \$20.

Fastenings.—The market continues quiet, with Spikes at \$2 @ \$2.05 delivered and Angle Bars at 1.85¢ @ 1.9¢ delivered.

Billets.—There is nothing new to report in this market, quotations remaining unchanged. Sailer shipments are \$28.50 @ \$29, ex-ship, and steamer \$30.50, ex-ship.

Wire Rods.—Very little business is being done in Wire Rods, no sales having been reported during the week under review. Freight rates are still high, and no reduction is anticipated before the fall. We continue to quote \$39.75 @ \$40 for future and \$40.25 @ \$40.50 for near-by delivery.

Coal Market.

Anthracite Coal is moving off freely at prices agreed upon prior to the recent advance, but the wholesale jobbers are as yet unable to report sales in any amount at prices up to the new schedule. The advance had a decided effect in hastening the receipt of orders, and solicitude is shown on the part of buyers to expedite shipments while railroad tolls remain at the rates now in force. At the meeting of representatives of the Anthracite Coal roads, held in New York a week ago to consider the subject, it was decided to defer the proposed advance of tolls until at least August 15, when it is said a renewed effort will be made to add 10¢ @ 25¢ per ton. On this point the Philadelphia *Record* remarks: "The Reading and Jersey Central Roads were in favor of the advance, but the objections of the Lehigh Valley, Lackawanna and Hudson Companies, reinforced by the Pennsylvania, decided against the motion, and the rates will be maintained until probably September 1. Tolls are now higher than they have been at the corresponding period for many previous years, and only a fraction lower than the rates charged during last winter." Complaint is made of delay in loading vessels at shipping ports; nevertheless shipments both East and West have been unusually active from the principal points. The facilities for transportation from the mines are also spoken of as inadequate. Respecting deliveries, the Philadelphia *Ledger* says: "The Reading Company report that their orders for Coal already booked will more than cover their entire output for this month, and that no orders will be filled after the 31st inst., excepting at whatever prices may be ruling on and after the 1st prox." The Pennsylvania Railroad Company complain that they are receiving from the Reading scarcely half the amount of Coal that was agreed upon. The Pennsylvania last week carried 218,000 tons over their lines east of Pittsburgh. The Reading shipped during the week 35,000 tons to Port Rich-

mond and 7000 tons to Elizabethport. Philadelphia is quoting freights 90¢ @ \$1.05 and discharge to Boston; New York, 80¢ @ 85¢. Quotations are as follows: Wyoming Free Burning, f.o.b. at South Amboy and Weehawken, Broken or Grate, \$3.85; Egg, \$4.15; Stove and Chestnut, \$4.50; Reading Hard White Ash, Chestnut, \$4.40; Stove, \$4.50; Egg, \$4.25, and Broken, \$4.10. The small steam sizes can be bought as low as \$2.40, and Buckwheat, \$2 @ \$2.10 f.o.b.

The output of Anthracite Coal is in larger volume from week to week, in anticipation of a more active demand. For the week ending July 21 the total production was 877,285 tons, as compared with 787,704 tons the previous week, and as against 664,000 tons for the corresponding week last year. Since January 1 the aggregate is 18,784,381 tons, an increase of 147,000 tons over the corresponding period in 1887. Both the Schuylkill and Lehigh regions were more active last week, but the Wyoming district produced much less.

The Bituminous trade is mainly confined to deliveries on contract. Prices are irregular and are quoted \$3 @ \$3.25 alongside.

The Reading Company will build extensive Coal docks at Buffalo, in combination with the Vanderbilt interests, the Lehigh Valley's terminals at that point being insufficient for both companies.

Metal Market.

Copper.—During the week spot Chili Bars opened in London at £78. 15/, but subsequently improved to £79. 10/, at which they closed, while futures remained unaltered £78. Best Selected gave way from £76. 10/ to £75. 10/. Trading in our own market has been restricted to preparations for the month's settlement, with the tendency slightly a hardening one. Sales did not exceed 600,000 lb in the aggregate; spot at 16.75¢; July, 16.80¢ @ 16.85¢; August, 16.65¢; September, 16.55¢; October and November, 16.50¢, and December, 16.35¢. The closing prices were 16.75¢ bid and 16.85¢ asked. Rio Tinto shares rose on the Paris Stock Exchange 41 francs during last week.

Tin.—London opened at £87. 5/, spot, and £87. 15/, futures, rising gradually to £88. 12/6 and £89. 5/, respectively, but giving way this morning to £87. 12/6 and £88. The market over there has been discounting the anticipated favorable statistical statement that is to appear at the close of the month, and is, moreover, swayed by the contending manipulators. Our own market followed suit steadily, spot rising from 19.40¢ to 20.25¢, July bringing 20.30¢ toward the close yesterday; August, 19.60¢, and October, 19.50¢. On the Metal Exchange, on first call, 10 tons August Tin brought 19.10¢; 10 ditto, 19¢, and 10 September, 18.80¢, the market being weakened by the decline in London above noted. At the close 19¢ was bid and 20.25¢ asked *Tin Plates*.—The stocks are very light; the demand has been fair, but not heavy; prices remain unchanged, with a few exceptions, owing to extreme scarcity, such as the higher grades of Coke Tins and some sizes of Stamping Plates. We quote at the close, large lines, on the spot: Siemens-Martin Steel, Charcoal finish, \$4.85 @ \$5.25; ditto Coke finish, \$4.75; Terns, \$4.30 @ \$4.40; Bessemer Cokes, \$4.45 @ \$4.60, and Wasters, \$4.20 @ \$4.25. Coke Tins are selling at 13/ in Liverpool, for prompt delivery. This is an advance of 3d. owing to the higher price of Pig Iron.

Lead.—There were sold during the week in the open market some 500 tons Common Domestic Lead to consumers at \$3.87½ @ \$3.90, while at St. Louis the

market remains steady at \$3.80 @ \$3.85. At the Metal Exchange 500 tons changed hands, with a downward tendency, spot ranging between \$3.85 and \$3.90, July selling at \$3.90, August at \$3.90 @ \$3.92½, and September at \$3.90. The closing prices were 3.85¢ bid and 3.92½¢ asked. In London Soft Spanish declined from £13. 5/ to £13. 2/6, and English Pig from £13. 15/ to £13. 7/6. The London *Mining Journal* of July 14, alluding to the Paris meeting of European Lead producers recently held for the purpose of forming a syndicate to improve the position over there, remarks: "The constitution and surroundings of the Lead market are altogether unfavorable to such a combination. Not only has the Spanish production of Lead increased of late years, but that of America, it is computed, will this year be quite up to the average, the opening up of the mineral resources of Idaho and Montana, in all probability, more than compensating for the falling off in the productiveness of the Leadville carbonate deposits, which for years had been the bugbear of the Lead market. The production of Lead in all countries—and more especially in America—is not altogether dependent upon the price of the metal itself, a large quantity being produced from the smelting of argentiferous and auriferous ores, the Lead in which would not pay to extract in the absence of the precious metals, and thus large quantities are annually put on the market almost as a by-product. The position of the Lead market is not favorable to concerted action among producers; at the same time there is a margin for improvement in price without jeopardizing the market by induced heavy deliveries."

Spelter.—A moderate trade has been done at firm rates for Common Domestic, which remains 4½¢, while Silesian is worth 5¢ @ 5½¢, as to brand. In London Silesian has declined during the week from £16. 7/6 to £16. 2/6. The London *Mining Journal* of July 14 reviews the Spelter situation at some length, as follows: "The depression in the Spelter market appears to have arisen from a variety of causes, chief among which is undoubtedly the stagnation in the Copper market, which has directly influenced the Brass trade and those of kindred alloys of Copper and Zinc in this country. The sudden advance in the price of Spelter also disadvantageously influenced the consumption of Zinc-White produced at the Silesian, Rhenish and Belgian Zinc works, and to such an extent that certain factories ceased operation altogether. As a consequence, abnormal quantities of Silesian Spelter were thrown on the English market from the stock which had accumulated there, and also from Austria, where large quantities had been stored as a precautionary measure taken on the spreading of a report last year that that country was about to impose a new import duty. These supplies, however, appear now to be absorbed, and the price has risen on the relaxation of sale pressure. Another influence on the market may have been the knowledge that the price had receded to within dangerous proximity of the limit fixed by the Belgian and Rhenish smelters at the beginning of last year, when it was proposed to form a syndicate in co-operation with a well-known English firm for the withdrawal from the market of 10 % of the production, as reported in the *Mining Journal* of the 17th September last. Apart from this, however, there would appear to be every justification for the improvement in the Spelter market. The Galvanizing trade is in a very healthy state, and has developed to an unprecedented extent during the past two or three years. On the other hand, the production of Spelter has fallen off since 1885 from all sources of supply, ex-

cluding America, where the make is almost entirely absorbed in home industries, and does not affect the European market. The European supply, however, appears to be still too large to maintain the high price which ruled a few months since. But the statistical position of the market equally appears to warrant an advance on the present price. The best interest of all will probably be found in the happy medium somewhere between current quotation and the highest point reached."

Antimony.—Nothing of special interest has occurred; the local demand is moderate but steady, and prices have been sustained in a jobbing way at 13½¢ Cookson and 10¢ Hallett, the latter remaining £39 in London.

New York Metal Exchange.

The following sales are reported:

THURSDAY, JULY 19.

25,000 lb Lake Copper, July.....	16.75¢
16 tons Lead, September, seller's right to double.....	3.95¢

Financial.

The general tenor of trade accounts is of a hopeful character, despite the usual summer dullness expected at this season. Perhaps, in surveying the actual situation, the possibility of a general strike on the Northwestern railroads is the most disquieting feature. The radicals in that section would doubtless invite an extreme resort, but it is hoped wiser counsels will prevail. The outlook among the iron-workers is decidedly better. Benjamin G. Clarke, president of the Thomas Iron Company, is reported as saying: "We have all the business we can attend to from now until November. Daylight is appearing, and both steel and iron are firmer and in better demand than they have been." The passage of the Mills bill in the House is another factor having a direct bearing on this important interest, respecting which further developments are awaited. New York dry goods jobbers report a trade satisfactory for this season, with a good representation from interior and Western markets. The feeling of increased confidence is especially due to excellent crop prospects in this country, coupled with increasing indications of a shortage in Europe. Railway warfare continues. The Nebraska rates took effect on Monday, and are as follows: Classes 1, 2, 3, 4 and 5, new rate, 52, 44½, 34½, 26, 20½; old rate, 52, 45, 40, 25, 35 respectively. For 200 miles, classes 1, 2, 3, 4 and 5, new rate, 73, 63, 48½, 46½, 29½; old rate, 73, 65, 58, 46, 41, respectively. The greater proportion of the business is in the third, fourth and fifth classes. The Nebraska railroads ask for another conference with the commissioners to revise rates. The Illinois Central

has withdrawn its high rates in Mississippi and adopted the lower rates of the commissioners. The new tariff sheet in Colorado likewise took effect on Monday.

The general markets are quiet, excepting sugar, which is advancing.

The rate on zinc was reduced by the Eastern roads to 17¢ between Chicago and New York, to correspond with the rates on pig lead and spelter.

The total clearings of 38 cities for the week ended July 21 were \$943,772,861, against \$359,616,605 last year, an increase of 10.3 %. Outside of New York the increase was 5.5 %.

The Stock Exchange markets have been dull and irregular, though generally strong. At the beginning of the week in the foreign business a feature was an active demand for American bonds, particularly from Berlin. On Friday the denial of the report that the American cable had been bought by Mr. Gould caused a partial fall in Western Union. At a later hour buying was stimulated by the news that the cable rates would be advanced to 25¢ per word on or about August 1. On Saturday Chicago advices concerning the railroad situation were unfavorable, reporting fresh cuts in passenger and freight rates. Neither this news nor the loss in the bank reserve, however, had any influence upon prices. On Saturday there was an advance, based on the Government crop reports, and an improved demand for coal was a pretext for advancing Reading and other coal shares. As the Week closes more strength is developed.

United States bonds are quoted as follows:

U. S. 4½s, 1891, registered.....	108½
U. S. 4½s, 1891, coupon.....	107½
U. S. 4s, 1907, registered.....	127½
U. S. 4s, 1907, coupon.....	127½
U. S. currency 6s.....	119½

Purchase of United States bonds under circular of April 17: Amount purchased, 4s, \$18,741,500; 4½s, \$8,567,600. Total, \$27,809,100. Cost of 4s, \$28,802,333.70; of 4½s, \$9,226,298.70. Total, \$33,028,634.40.

The weekly bank statement showed a decrease in reserve above the 25 % legal requirements of \$1,294,000. The excess of reserve is thus decreased to \$26,440,400. The latter amount is, however, several times in excess of the reserve at the corresponding time last year. Specie showed a decrease of \$2,218,800. In loans there was very little change. The demand for money has been rather more active, with little change in the rates. Local institutions are not disposed to increase their discount lines in prospect of finding a better use for their funds at a later date, but outside money is plenty for temporary investment. We quote 60 @ 90 days' indorsed paper 4 @ 4½ %; longer dates, 5½ @ 5½ %. There was also some hardening of rates in the West. Surprise was occasioned by the failure of the old dry goods firm, Levi M. Bates & Co., who confessed judgments to the amount of \$126,264. The liabilities are reported to be about \$250,000, an amount probably not exceeding the actual assets. Mr. Bates lost heavily by a Detroit failure and business of late has not been profitably conducted. Wm. T. Coleman & Co., of San Francisco, propose to settle with their creditors at 40 cents on the dollar. It is now believed that the creditors of James D. Fish, formerly president of the Marine Bank, will receive their dues in full, the court having decided that certain real estate in this city is available for this purpose. In the United States Senate the bill appropriating \$1,000,000 to reimburse the depositors of the Freedmen's Saving and Trust Company for losses incurred by its failure was passed without a division. The \$700,000 in securities which were taken from the Union Bank, of Providence, by Teller Pitcher, now under arrest in Montreal, were recovered intact.

Sterling exchange is heavy; posted rates are \$4.87½ @ \$4.89½. The London *Economist* of July 14th says: "Gold is being withdrawn from the bank for export, and further amounts are, it is understood, to be taken for South America; and capital is being steadily, if slowly, absorbed in connection with the multitude of new undertakings that are being launched. All these are influences that work in the direction of dearer money."

The imports of merchandise at this port during the week were valued at \$8,303,000, of which \$3,000,000 represents dry goods. Since January 1 the total is \$266,870,000, as compared with \$262,300,000 for the corresponding period last year, and \$242,426,000 in 1886. The exports for the week amounted to \$6,289,265.

Imports.

The imports of Iron and Steel, Hardware, &c., at this port from July 14 to July 20, inclusive, and from January 1 to July 20, inclusive, were as follows:

Iron and Steel.		
	July 14 to July 20.	Jan. 1 to July 20.

Wages in Steel Works.

The Pittsburgh *Despatch* has published the following tabular comparison of the wages paid in the steel works at Braddock and at Chicago:

Blast Furnace Department.	Furnace No. 2, Union Steel Company, Chicago.
SLIDING SCALE.	STANDARD SCALE.
Turn 12 hours.	
Keeper.....	\$2.23
First helper.....	1.70
Second helper.....	1.60
No third helper.....	2.45 th'd h'p'r.
Stoveman.....	1.70
Top filler.....	1.61
Filler.....	1.51

Converter Department.

First converter.....	\$1.33	per 100 tons.	\$1.80	per 100 tons.
First pitman.....	1.32	"	1.80	"
First ladleman.....	.99	"	1.80	"
Blower.....	1.08	"	2.34	"
Bottom builder.....	1.06	"	.89	tonnage of 2 turns.
Spiegel melter.....	1.33	"	1.80	per 100 tons.

Blooming Department.

Heater.....	\$5.00	per 100 tons.
Heater's help'r.....	\$1.32	per 100 tons.
Assist. roller.....	1.09	"
Leverm'n (sh'rs).....	.63	"

Rail Mill Department.

Roller.....	\$210.00	per month.
Leverman.....	\$3.10	turn 12 h.
Spell leverman.....	2.85	"
First engineer.....	2.38	"
Water tender.....	2.00	"
Straightener.....	1.43	100 tons on entire output of mill.
		9.00 100 tons on individual work.

Engineer and Boiler Department.

	Per turn of 12 hours.
Water tender.....	\$1.95
Asst. w. tender.....	1.43
Ingot loco. eng.....	1.72
1st blowing eng.....	2.38
2d blowing eng.....	1.90
3d blowing eng.....	1.57

Crusher engin'r.....	1.43
Sp'gel ladle eng.....	1.19
Skull br'k'r eng.....	.91
Boiler tender.....	1.57
Bloom train en.....	2.00

The Edgar Thomson figures are from the sliding scale, on the basis of \$30 at mill. The Chicago figures are said to be from the official scales of the Bridgeport Mill, and the North Chicago Rolling Mill Company's mill.

WESTERN IRON MILLS.

The Lockout Ended.

The Lockout in the Western iron mills, which has been in progress since the beginning of the present month, has been definitely settled by the manufacturers agreeing to sign the scale and resume work as soon as repairs are completed. A meeting of the Manufacturers' Association of Iron, Steel and Nails was held in Pittsburgh on Wednesday, the 18th inst., with President A. F. Keating in the chair. There was a large attendance of manufacturers as it was known that important business would be brought before the meeting. After a somewhat lengthy session, the following resolution was unanimously adopted: "Resolved, That the Conference Committee of manufacturers be dissolved, and that all members of the Association of Manufacturers of Iron, Steel and Nails who have not signed the Amalgamated Association scale be absolved from all pledges, written or verbal, and are authorized to act in their individual capacity regarding the starting of their works." This action dissolves the conference committee, and, of course, puts an end to the lockout. In addition to this the manufacturers' association is practically dissolved, and unless a reorganization is effected there will be no conference committee appointed by the manufacturers to meet a similar committee from the Amalgamated Association, when the present scale expires next year. Each firm will settle the scale question individually and on its own responsibility. At this time it is of course impossible to state what the manufacturers will do before another year passes, but it is the impression that a mistake has been made in allowing the association to go to pieces. It has been pointed out that in 1882, when the great strike took place, the manufacturers were strongly united and succeeded in administering a defeat to the Amalgamated Association, and it is claimed that if the manufacturers had been as well united this year as they were then they would have been successful and would have compelled the Amalgamated Association officers to recognize and sign their scale. It is thought that before the time arrives for the annual conference next year the manufacturers will have realized that they have made a mistake and that their organization, which at present is about dissolved, will be reorganized on a stronger basis than it ever has been, and that they will be prepared to meet the Amalgamated Conference Committee as a united body. The dissolution of the Manufacturers' Association of Iron, Steel and Nails in no way affects the standing of the Western Iron Association as has been erroneously stated. The two organizations are entirely separate and distinct. The first named dealt with labor questions exclusively, while the last named organization deals with prices only, and is still in

existence. While a number of the mills are still idle and have not signed the scale, it is for the reason that repairs have not been completed and not because of any determination to resist signing the scale. The manufacturers realize that they have lost the fight, and those whose mills are yet idle will sign the scale as soon as they are ready to resume operations. Since our last issue the following named firms have signed the scale:

Sharon Iron Company, Limited, Sharon, Pa.
 Canonsburg Iron and Steel Company, Canonsburg, Pa.
 P. L. Kimberly & Co., Limited, Sharon, Pa.
 Chess, Cook & Co., Pittsburgh, Pa.
 Arethusa Iron Works, New Castle, Pa.
 Zug & Co., Limited, Pittsburgh, Pa.
 Henry Lloyd Son & Co., Pittsburgh, Pa.
 Columbia Iron and Steel Company, Uniontown, Pa.
 Cherry Valley Iron Company, Leetonia, Ohio.
 Hussey, Howe & Co., Limited, Pittsburgh, Pa.
 Kirkpatrick & Co., Limited, Leechburg, Pa.
 Chartiers Iron and Steel Company, Limited, Pittsburgh, Pa.
 P. L. Kimberly & Co., Limited, for Atlantic Iron Works, Sharon, Pa.
 North Chicago Rolling Mill Company, Bay View, Wis.
 Falcon Iron and Nail Company, Youngstown, Ohio.

British Iron and Metal Markets.

[Special Cable Dispatch to The Iron Age.]

LONDON, WEDNESDAY, July 25, 1888.

There has been further improvement in the statistical position of Block Tin during the first half of July, and to this fact, rather than to what is generally termed "speculative manipulation," is due the advance in prices. The policy of the producers in refraining from sending forward excessive supplies doubtless has some bearing upon the situation, but heavy deliveries have latterly figured more conspicuously than anything else and make a deep impression. Returns for the first half of the month show total deliveries of no less than 2800 tons, which, together with the smaller receipts from primary points, make a total reduction of 7600 tons in the supply on spot and afloat. There is still a considerable amount of Metal due consumers on three months' contracts. Shipments from the Straits, it is stated, will have been moderate the last half of the month, and a further decrease in stocks is expected. Speculation has been moderate, however, despite the improved situation.

Copper has fluctuated to a very moderate extent, and the turnover of contracts during the week has been rather small as well, outside interest being tame and the purchases by consumers still of a conservative nature. Chili Bar three months' futures are maintained at £78 by the syndicate, and new form contracts are at within £5 @ £6 of that price. The syndicate is still a ready buyer of Chili Bars at £78, but does not go beyond that price. It is the belief in well-informed quarters that the syndicate efforts are directed toward holding the market on the £78 level, and that no great advance is contemplated. There are rumors afloat of a projected amalgamation of the lead-

ing Spanish mine interests, which, if carried to a successful end, will greatly strengthen the situation. It is also stated that means are being sought in Paris to conciliate the interests of the English smelters. Several important sales of furnace material have been made by the Société des Métaux, particulars of which are kept strictly private. The Bratsberg Company have concluded sales covering the entire production of their mines up to June, 1889, at 13 francs. The contracts specify that the output shall not exceed 2000 tons.

The Scotch Pig-Iron market is showing decided improvement in tone. Makers have ceased storing in "makers' brands," and the "bears" in the speculative arena have consequently turned about in alarm to cover their "short" sales of warrants. This movement is reflected in an advance on warrants to 38/9. There has been no further curtailment of the production, and the change above referred to is attributed to the receipt at Birmingham of orders for a new arsenal for the Ameer of Afghanistan. The latter, it is anticipated, will require the use of a considerable quantity of Scotch Pigs. In to-day's transactions in Scotch warrants as high as 39/ was touched, and the firmness there was reflected in other branches. Makers' brands are better by about 6d than a week ago in most instances, and Middlesboro' Pig has improved 6d, while Bessemer Pig displays greater firmness at present rates.

The Steel trade has shown but a moderate degree of animation. Prices are a shade lower on Blooms and Slabs, but otherwise fairly steady.

There is not the slightest improvement in the demand for any class of old material.

There has been no important change in the condition of the Tin-Plate trade. A steady business is reported in most quarters and the favorable position of supplies, in the face of the heavy production, together with the further rise in the cost of Block Tin, serves to hold values very steady.

A new make of Siemens Steel in bars will shortly be placed on the market, and also the make of a new Bessemer Steel works, both located in Glamorganshire.

The Hope Plate Iron Works are again in operation. The sale is reported of the Glaisdall furnaces for £8900. The Newport rolling mills have been started by the John Hill Company, employing 30 puddling furnaces.

Scotch Pig.—More business doing and the market stronger:

No. 1 Coltness, f.o.b. Glasgow	48/
No. 1 Summerlee, " "	47/6
No. 1 Gartaherrie, " "	44/6
No. 1 Langloan, " "	44/6
No. 1 Carnbroe, " "	39/6
No. 1 Rhotts, " at Leith	45/
No. 1 Glangarnock, " Ardrossan	43/
No. 1 Dalzellington, " "	40/
No. 1 Eglinton, " "	39/

Steamer freights, Glasgow to New York, 5/; Liverpool to New York, 7/6.

Cleveland Pig.—The market quite strong with demand active. No. 1 Middlesboro', G.M.B., 35/; No. 3 do., 32/6.

Bessemer Pig.—Demand brisker, and prices show greater firmness. West Coast brands, mixed numbers, 43/, f.o.b. shipping point.

Spiegeleisen.—There has been no material change the past week. English 20%

quoted 80/, f.o.b. N. W. England shipping point.

Steel Rails.—A fair volume of business at steady prices. Standard sections quoted at £3. 17/6, f.o.b. at N. W. England shipping point.

Steel Blooms.—Values rather weaker, but a fair trade at the decline. We quote at £3. 12/6 for 7 x 7, f.o.b. at N. W. England shipping point.

Steel Billets.—Business moderate and prices barely steady. Bessemer, 2½ x 2½ inch, £3. 17/6, f.o.b. at N. W. England shipping point.

Steel Slabs.—Rather weak market, with demand light. Bessemer, £3. 16/3, f.o.b. at N. W. England shipping point.

Steel Wire Rods.—A quiet market, with prices steady. Mild Steel No. 6 quoted at £5. 13/9 and No. 5 at £5. 10/, f.o.b. at N. W. England shipping point.

Old Rails.—The market very quiet. Tees quoted at £2. 15/, and Double Heads £2. 17/6, c.i.f., New York.

Scrap Iron.—No improvement in the demand. Heavy Wrought quoted at £2. 5/ @ £2. 7/6, f.o.b.

Crop Ends.—Only small sales making. Bessemer quoted £2. 5/ @ £2. 7/6, f.o.b.

Tin Plate.—The demand has been good, and prices are firm. We quote, f.o.b. Liverpool:

IC Charcoal, Allaway grade	14/6 @ 15/
IC Bessemer steel, Coke finish	13/ @ 13/3
IC Siemens	13/3 @ 13/6
IC Coke, B. V. grade	13/ @ 13/3
Charcoal Terne, Dean grade	12/6 @ 12/9

Manufactured Iron.—The market rather quiet. Prices a shade higher on Sheets, but otherwise unchanged. We quote, f.o.b. Liverpool:

Staff. Ord. Marked Bars	£ s. d.	£ s. d.
" Common	4 17 6	@ 5 0 0
" Bl'k Sheet, singles		@ 6 15 0
Welsh Bars (f.o.b. Wales)	4 12 6	@ 4 15 0

Tin.—The market somewhat easier to-day, and less active, showing £1. 15/ decline from the highest price. Straits quoted at £87. 10/6 @ £87. 15/, spot, and £88 @ £88. 5/ for three months' futures.

Copper.—Transactions have been moderate, but the market remains very firm. Chili Bars closed at £79. 15/, spot, and £78 @ £78. 5/, three months' futures. Best Selected, £75, nominal.

Lead.—There has been a very fair business and a better tone to the market. Soft Spanish, £13. 15/ at the close.

Spelter.—Demand has run fairly and prices show but slight change. Silesian, ordinary, £16. 2/6 at the close.

It is reported that the vacancy in the presidency of the Columbia School of Mines, New York City, caused by the resignation of President Barnard, may be filled by the selection of a Western metallurgist of national reputation, Prof. Wm. B. Potter. His selection would give general satisfaction to those interested in the success of this institution, but his retirement from his present field of usefulness would be the cause of universal regret among his present associates.

Crude oil from Lima, Ohio, will arrive at Chicago through a pipe line this week, and it is stated that the company expect to distribute 800,000 barrels of it per day.

Hardware.

Manufacturers and merchants are making active preparations for the fall trade, which has not yet opened in any considerable volume. Prices are receiving careful revision, and some minor changes are to be noted, but the market, as a whole, remains without important variation. Prices generally are not regarded as strong, and buyers are careful not to order beyond their requirements.

Cut Nails.

Considering the season, a fair trade is being done in Nails, and for the month has been above the average. Prices are pretty firmly adhered to, at least so far as standard brands are concerned. We continue to quote \$1.90 to \$1.95 for carload lots on dock, and \$1.95 to \$2 for small lots from store.

Wire Nails.

The demand is moderate, and prices continue without material change. Carload lots at factory are quoted regularly at \$2.45 to \$2.50, and small lots from store are offered at the usual advance.

Miscellaneous Prices.

The Association of Emery Wheel manufacturers have been formed, and most of the manufacturers have agreed upon the adoption of a common list to secure uniformity in list prices, which will be appreciated by the trade, to whom the diversity of lists has been a source of annoyance. The list, which goes into effect August 1, is on substantially the same basis as those heretofore in use. No agreement in regard to discounts has been entered into. The following companies are members of the Association:

NORTHAMPTON EMERY WHEEL CO.
UNION STONE CO.
SPRINGFIELD GLUE AND EMERY WHEEL CO.
GRANT CORUNDUM WHEEL CO.
NORTON EMERY WHEEL CO.
WALTHAM EMERY WHEEL CO.
STERLING EMERY WHEEL CO.
CELLULOID EMERY WHEEL CO.
NEW YORK BELTING AND PACKING CO.
PHILADELPHIA EMERY WHEEL CO.
LEHIGH EMERY WHEEL CO.
VITRIFIED WHEEL CO.

J. L. Otis, of the Northampton Emery Wheel Company, is the president; W. P. Lashure, of the Grant Corundum Wheel Company, vice-president, and C. L. Allen, of the Norton Emery Wheel Company, secretary and treasurer.

Some of our readers may not have observed the change in the classification and price of Screw Hooks and Strap Hinges and of heavy welded Hook Hinges which has been made by the manufacturers. It is indicated below, the prices given being f.o.b. factories, 60 days, or 2 per cent. discount for cash in ten days:

6, 8, 10 and 12 inch, per pound..... 3%
14, 16, 18 and 20 inch, per pound..... 3%
22, 24, 30 and 36 inch, per pound..... 2%
..... 2%
..... 2%
..... 2%

The Nimick & Britton Mfg. Co., Pittsburgh, Pa., have issued their Padlock list in a separate sheet with the quotation of discount 70 per cent.

The prices on Tackle Blocks remain without open change, but slightly lower quotations are made in some cases, and the market is not quite as regular as could be desired.

Heavy Hammers and Sledges remain in a somewhat demoralized condition, and some low quotations are current.

Copper Rivets and Burrs are rather weaker than heretofore, notwithstanding the condition of the Copper market, and slightly lower quotations are made by some of the manufacturers. There is, however, some irregularity in the prices at which

the different manufacturers are offering the goods, for which quotations are from 7½ to 10 per cent. apart.

The Lock market shows little sign of improvement, low prices prevailing and competition between the manufacturers being animated.

The prices of Padlocks also rule low, the extreme figures at which the goods are sold being somewhat lower than those which have prevailed for considerable time.

The following changes have recently been made in the extras on Rope: The extras on uncoiled Manila and Sisal Rope have been reduced from ½ to ¼ cent per pound, a similar change having been made on coarse and medium uncoiled Hay Rope. The extras on the fine Hay Rope have been changed from 1½ to 1¼ cents. The base prices remain as before.

The Mallory-Wheeler Company, New Haven, Conn., and 64 Reade street, New York, have issued under date of July, 1888, a pamphlet containing revised list prices and discounts for their Locks, Knobs, &c. The list remains on substantially the same basis as heretofore, the changes which are made being for the purpose of equalizing some goods that were out of proportion. The company have also added an entirely new line of low-priced Locks and Latches, which are furnished with their flat Steel Keys. They have also omitted some of their former numbers, which were prefixed by an "x," and added a number of patterns. At the same time the company send out extra pages for insertion in their catalogue. The regular discounts remain as before, all goods in the list being subject to a discount of 50 and 10 per cent., except Padlocks and Padlock Keys, which are subject to a discount of 65 and 10 per cent., a bonus of 2 per cent. in addition for cash within 30 days.

The following quotations on goods made by E. Blair, Bucyrus, Ohio, will be of interest:

Blair's Adjustable Husker, per gross..... \$8.00
Blair's Adjustable Clipper Husker..... 7.00
Blair's Fodder Squeezer, per doz..... 2.00
Blair's Climax Fodder Squeezer, per doz. 1.25

The market for Steel Squares continues practically as at our last report, when we referred to the termination of the combination. Since that time prices have, however, settled slightly, somewhat lower quotations being made owing to the active competition between some of the makers. This line of goods is regarded as quite unsettled, and there are no indications of an immediate arrangement by which prices will be controlled.

The Water Elevator and Purifier Company, Cincinnati, Ohio, in a circular relating to their Bucket Pump, allude to its special features and state that they are desirous of placing the sale of the Pumps in the hands of energetic and responsible dealers. They further state that they will ship sample orders for six Pumps, f.o.b. Cincinnati, at \$10 each, subject to a discount of 40 and 5 per cent.

Ammunition.

A report is current that the E. C. Meacham Arms Company have made application to the association to be reinstated, but inquiry develops the fact that it is without foundation, no such proposition having been made by the company. That the company had made such application is referred to by some opposed to them in interest as indicating that they have failed in obtaining a supply of goods and as being *prima facie* evidence that their stock is broken and their supply cut off. As such report is without foundation the conclusion thus drawn from it of course falls to the ground, but the fact

that the report is thus circulated indicates the annoyance caused by the cut prices of the company, and the efforts which are necessary by their competitors to break as far as possible the force of their quotations. Moreover advices indicate that the company are in fact supplying a good many goods at the slight concessions which it is their present policy to make, while at the same time many other goods are sold in a regular way, thus making the policy a profitable one. It is generally acknowledged that in the present condition of things a sufficient supply of goods can easily be obtained by the company which will enable them to continue their policy at least during the season. In this state of things there is a more pronounced feeling on the part of the trade that the association will be acting the part of wisdom if without unnecessary delay they reach such an understanding with the Meacham Company as will remove this demoralizing influence. It is assumed that with the recent withdrawal of the requirement that contract houses purchase one-third of their goods from the manufacturers and with such other minor modifications as may be desirable, arrangements might be agreed upon which would be satisfactory to the company and advantageous to all concerned. It is the general opinion of the best-informed parties that such a result is likely ultimately to ensue, unless in the meantime something radical is done in the way of recasting the existing system by which the association is marketing its goods. It is also believed that the company are now willing to be reinstated, provided they are given all the privileges of other specials.

The real difficulty in the case, however, is not the position taken by the Meacham Company, occupying though they do an influential position in the trade, but in the fact that the system which the association has adopted, and on the whole carried out thus far with a good measure of success, has apparently run its course, so that it fails to accomplish the desired ends of protecting the different classes of trade and securing uniformity of prices. This is indicated not only by the fact that retail buyers are able, in many cases, to obtain from their jobbers slight concessions in price, but is also alluded to in the remark of an exceptionally well-informed party that a large proportion of the contract houses are believed to be obtaining their goods with an extra 2½, 5 or 7½ per cent., given indirectly and in a covert way. To such an extent is this irregularity in price carried that well-posted buyers, large and small, who have not heretofore had the benefit of these cut prices are endeavoring to procure them, and the association in the present juncture are apparently not disposed to look too closely into the facts, or to press their authority too far. The general fact that the trade are not disposed to enjoy the protection given them by the carefully elaborated scheme of the association, but in this case, as in so many other combinations, are willing to divide their extras, is a matter that must force itself upon the attention of the manufacturers, and unless the existing unsettled and unsatisfactory condition of things can be corrected, it is thought not unlikely there may be a decided change in their policy, and the adoption of a scheme of prices much simpler than those in force, in which there would not be attempted so complicated a protection for the trade.

Items.

Horton, Gilmore, McWilliams & Co., of Chicago, are making a new departure for a Hardware house. In addition to the 40 salesmen they now employ, they propose to put on from 10 to 15 more men to sell Jewelry to those who handle such goods—embracing dealers in fancy articles, drug,

gists, gentlemen's furnishers, dry-goods stores, &c. They will carry a full line of Optical Goods, Pocketbooks, Oxidized Jewelry and fine Cutlery. Their stock will be as complete as any of the best Jewelry houses in Chicago, with the exception of Watch Cases and Movements, which would have been added if they had room to carry them. Their Revolver department has been enlarged and made one of the most complete in the country. They recently gave an order for one of the largest stocks of Carving Knives known by the oldest salesman to be taken outside of Chicago. Their Bicycle and Tricycle business has exceeded their expectations and they intend next season to make it a more prominent branch of their business. The store has just been remodeled, to give more room to the Cutlery and Jewelry departments, and sliding ladders have been put along the shelves to expedite getting out orders. The removal of the offices to the front of the store has also given increased capacity for laying out goods in the rear, their facilities having been badly cramped by their greatly increased business. The room thus gained represents an increase of about 20 per cent. of space in the shipping department. The offices are now well adapted also for the accommodation of the increased force of clerks rendered necessary by the expansion of the business. The efficiency of the force has further been increased by the engagement of men of special training and proved ability to take charge of the several departments. It is their intention in all the lines handled to be second to none, whether they deal exclusively in Firearms, exclusively in Jewelry or exclusively in Hardware.

Sidney Shepard & Co., Buffalo, N. Y., have issued their July 1 illustrated price list of goods manufactured by them. Two pages are devoted to illustrations of their works, office and salesrooms, the remainder of the pamphlet being occupied by Deep Stamped Ware, Shallow Stamped Ware and Trimmings, Pieced Tinware, Japanned Ware and miscellaneous goods. The latter department includes an extensive variety of household specialties, Water Coolers, Coal Vases, Coal Hods and Grocers', Druggists' and Spice Dealers' Tinware. They will be pleased to mail a copy of this pamphlet on application.

The Mercantile Mfg. Co., Cleveland, Ohio, issue circulars relating to the Regent, Cyclone and Hercules Wringers, in which these goods are illustrated, with list prices.

J. F. Wollensak, Chicago, Ill., issues a circular and price list relating to the Eagle and the Shield Transom Lifters, which are similar to his Class 3 and Class 4 goods, except that they are a cheaper grade, and are put on the market to meet the demand for a low-priced Transom Lifter. The Shield Lifter has the patent Safety Spring, which acts as a cushion and receives the shock to prevent the breaking of the glass should the Transom be allowed to fall accidentally or through carelessness.

W. B. Avery Mfg. Company, Cleveland, Ohio, issue a price list devoted to their Avery Seamless Steel Elevator Bucket, Avery Combined Leather Punch and Saw Set and the Holt Combined Anvil and Vise. These goods are illustrated, with information in regard to their special features and advantages.

From the advertisement on page 42 it will be seen that King, O'Connor & Co., Baltimore, Md., call attention to the Little Giant Scroll Saw, the advantages of which they allude to. Its simplicity and the ease with which it is worked are points that they specially mention, as well as the low price at which it is offered.

E. Blair, Bucyrus, Ohio, issue circulars relating to his Hog and Pig Rings and

Ringers, Blair's Fodder Squeezer, Adjustable and Clipper Husking Pins and the Climax Fodder Squeezer, in which these different articles are illustrated.

By the announcement which appears on page 46 it will be seen that the attention of manufacturers is called to the advantages possessed by Des Moines, Iowa, as a location for manufacturing enterprises. Among these it is mentioned that there are 16 lines of railroads there, and that coal is procurable at a very low figure.

The Pacific Lock and Seal Company, 304 North Eighth street, St. Louis, Mo., have issued a prospectus relating to the company and their manufactures. It is proposed to incorporate the company under the laws of Missouri. The pamphlet gives a full description with illustrations of the different goods for the manufacture of which the company hold patents.

The circular issued by Walter Hart, 65 Stone street, New York, describing the National Flag-Staff Bracket, of which he is the patentee, calls attention to the advantages possessed by it. It is pointed out that the separate parts when put together allow of the Bracket being set on any surface, giving any desired angle to the pole. Its safety is also referred to as follows:

By examining the cut at head of circular you will notice that the separate parts, when put together, allow of the Bracket being set on any surface, giving any desired angle to the pole. This Bracket is essentially a safety one, for as it is removable (and the only one that is) it should be made a fixture to the end of the staff, where it will balance the overhang of the staff, and act as a handle to the butt. By this it removes the danger (which exists with every other Bracket) arising when leaning over the ground to place the staff in position, for with mine, the staff being already in the Bracket, all that is required is to slip the foot of the Bracket into the staples, which latter should be secured by screws.

The Brackets are made with diameter of socket ranging from 1½ to 2 inch, and a Group Bracket is also furnished providing for a display of five flags.

Shultz Belting Company, St. Louis, Mo., have sent us a very neat zylonite tablet for the pocket, which is used for calling attention to their Belting, and which gives on its last page a price list. This company are running their works, we are advised, with a full complement of operators, and report a large sale from the home and branch warehouses for their Shultz's Patent Filled Leather Belting.

In a game of base-ball between the teams of Smith, Lyon & Field and William Bryce & Co., on the 21st inst., at Prospect Park, the former were defeated by the following score:

Innings.....	1	2	3	4	5	6	7	8	9	
W. B. & Co.....	4	3	1	2	3	1	1	1	1	17
S., L. & F.....	0	0	0	0	0	1	0	3	0	4

C. H. Gurney & Co., manufacturers' agents for the sale of Steel, Heavy Hardware, and Railway, Machinists' and Mining Supplies, 247 and 249 Lake street, Chicago, have just issued a superb catalogue, comprising 288 pages of illustrations and price lists, bound in heavy boards with beveled edges, covered with olive-colored cloth. The name of the firm is stamped in gilt on the back and on the side. The contents comprise the full line of Tools manufactured by the Atha Tool Company, the Boston and Lockport Block Company's specialties, Fisher & Norris's goods, the Syracuse Bolt Company's products, &c. Each cut is given ample room for a proper display, and the whole work is above criticism as a specimen of good bookmaking. The large line of general Hardware manufactured by the Penn Hardware Company, for whom this firm have been sole Western agents for the past six years, is not included in this catalogue, but is covered by a special catalogue of

352 pages, which is forwarded to applicants. For the use of their office and salesmen Messrs. Gurney & Co. bind the two catalogues together, making a very handsome volume of 635 pages, which is put up in the best of leather with flexible covers.

The Rockford Cutlery Company, Keokuk, Iowa, send out a circular illustrating the Boss Wire Cutter. It is stated that it will cut No. 7 Wire with one-half the power required in the use of other Cutters.

We have received from the Moser Holder Company, Belleville, Ill., a circular relating to their Bundle or Package Carriers, to which we have before alluded. They advise us that they have 43 machines and can turn out 40,000 holders per day. They are appointing agents in the principal cities.

Our readers will observe among the Special Notices one in which a Hardware business in Northern Indiana is offered for sale by A. & B., who may be addressed in care of this office. The stock is referred to as invoicing about \$5000 and the business as being a growing one in a prosperous town.

The announcement in our last issue in regard to the American Screw Company's new Screw was received by the trade with much interest. It is, however, proper that we should state that the company are not yet prepared to put these goods on the market, and are not intending to offer them to the trade before next Spring. They have but just perfected the development of the requisite machinery, and before they can supply the goods in any quantity they will have to build more machines, which they are now doing.

The Silver & Deming Mfg. Company, Salem, Ohio, issue an illustrated catalogue and price list of Ensilage and Feed Cutters, which they manufacture. In the preface to the pamphlet, which is dated July 1, the manufacturers direct special attention to the various improvements recently made in the construction of their Ohio Ensilage and Feed Cutters. The first 30 pages of the circular are devoted to illustrations and descriptions of these Cutters, and a number of testimonials are also printed. The remainder of the pamphlet consists of a treatise on Silos and Ensilage compiled from various sources for the Silver & Deming Mfg. Company. The construction of Silos and the value of Ensilage are not very generally understood, and a little treatise of this kind will be of much value. Accompanying the catalogue is a folded circular also relating to the Ohio Ensilage and Feed Cutters.

The Palmer Mfg. Company, 290 Pearl street, New York, favor us with advertising sheets concerning some of their goods. One sheet illustrates and describes their new Oblong Embossed White Brilliant Tray, which is some 11 x 14 inches in size. Two other circulars refer to their White Embossed Crumb Tray and Brush, in silver finish, the different designs being marked Nos. 35 and 55 respectively.

The Reading Hardware Company.

are now clearing away the *débris* of the late fire, so as to get in shape to rebuild as early as possible. They carried an insurance of \$208,000 on their entire works. Of this amount of insurance about 80 per cent. is involved in the fire. The remaining portion of their works, consisting of Iron and Brass Foundries, Butt and Pulley departments and Screw Factory, are being run to their full capacity, and are now turning out Apple Parers, Coffee Mills, Japanned Store Shelf-Brackets, Cast Butts, Gravity and Surface Blind Hinges, Harb;

ster's and Lull & Porter Shutter Hinges, Gate Hinges and Latches, Turnbuckles, Tower Bolts, Barrel Bolts, Flat, Cased, Acme and Excelsior Shutter Bolts, Japanned and Bronzed Thumb Latches, Barn-Door Latches, Japanned Store-Door Handles, Japanned and Bronze Plated Door-Pulls, Japanned and Bronze Plated Drawer-Pulls, Common Frame and Axle Pulleys, and Jail Padlocks, Barn-Door Hangers, Barn-Door Rollers and Barn-Door Rail, Hay-Fork Pulleys and Grindstone Fixtures, Bench Screws and Foot Scrapers, Porch Irons and Well Wheels, Bed Fasts and Store-Truck Casters, Plate, French and Bed Casters, Window-Shade Brackets, Roller Ends, Waffle Irons, Sad Irons and Wood Screws. On last Monday, the 23d inst., they started up the Manhattan Hardware Company's works, and by August 1st they will be making quite a variety of the leading goods, and by September 1st they will be prepared to furnish two-thirds of their line of Builder's Hardware and one-third of their line of Locks, Knobs and Escutcheons. They expect to have the buildings that were destroyed by fire rebuilt within the next 90 days and restocked with new machinery, so that by January 1st they will be able to meet all the demands of the trade. Within one week they will have their plating and bronzing departments running, which will enable them to supply their well and favorably known line of Geneva Bronzed Hardware. They carry large and well-assorted stocks at their warehouses in New York, Philadelphia and Chicago, and are filling a large portion of their orders from same. The company ask us to thank the trade most cordially for their sympathy and favors, and they hope to be able at an early date to resume the pleasant relations in all departments which have so long existed.

Oliver Bros. & Phillips,

Pittsburgh, Pa., under date of July 20, issue the following quotations on their extensive line of goods. They also send out a circular relating to the Star Steel Fence Posts, Stiff Horse Hitchings and the Star Picket and Tent Pins, in which these articles are illustrated. Their quotations are as follows:

Page in catalogue.

Trade Topics.

The following review of the Hardware market of Louisville, Ky., will be of interest:

The Hardware trade of Louisville, Ky., is showing signs of decided improvement in volume. The jobbing houses have completed the

work of taking stock, and disclose a very satisfactory status. The amount of business transacted in the last six months was considerably above the average, and the outlook for the coming season is good. The salesmen are all out on the road again, and meet with ready response from the country merchants. The continued decline in prices of several lines of manufacture did not prevent the dealers keeping up full stocks, although at each stage down the manufacturers insisted that the lowest possible limit had been reached, yet down they came one more notch, evidencing wonderful elasticity of their statements, or else their possibilities; but now that bottom is believed to be touched really, there begins to be heavy buying, showing that the trade is disposed to have some confidence, and is anxious to invest idle money in staple goods that are likely to make fair returns.

The resumption by the mills is received with satisfaction by the trade generally, and contracts will now be filled on time instead of recourse being had to the provision which is invariably printed in bold type on all letter-heads of the manufacturers, "Orders subject to strikes, &c., at mill."

Carriage and Wagon Goods move briskly, some Barb Wire is going out and the Wire-Nail trade is better than it ever has been. The Agricultural Implement dealers are receiving full stocks of their wares, looking for a heavy demand this fall.

The Ohio Valley Centennial Exhibition.

Among the Hardware exhibits noticed at the Ohio Valley Centennial Exposition were a line of Axles, Wagon, Carriage and Buggy, the production of the Standard Axle Mfg. Company, Wheeling, W. Va.

J. B. Schroeder & Co., Cincinnati, Ohio, show a varied and excellent line of Bronze Builders' and Cabinet Makers' Hardware, consisting of Loose Pin Butts, Knobs, Escutcheons, Drawer Pulls, Handles, Mortise Locks, &c.

Henry Disston & Son, Philadelphia, Pa., make a magnificent exhibit of their productions, consisting for the greater part of Circular, Cross-Cut and Hand Saws, Masons' Tools of every variety, the exhibit being displayed in a glass cabinet some 10 x 16 feet and 18 feet high, the front top of which is surmounted by a well-executed likeness of Henry Disston.

The Black Diamond File Works, of Philadelphia, Pa., adjoining the exhibit of Henry Disston & Sons, display a line of their productions in a compact and well-arranged form, showing these well-known Files to good advantage.

The Fischer Ice Tool Company, Hamilton, Ohio, display a large assortment of Ice Tools, Machinery, &c., the product of their works.

The Riverside Iron Works, for whom the Hazen Company, Cincinnati, are agents, provide an interesting display of their productions, consisting of Steel Pipe of every description, Steel Nails, Tubing, Bent Cold Steel Blooms, Billets, Ore, Pig Metal, &c.

The Whitely Steel Company, Springfield, Ohio, exhibit their Hot and Cold Rolled Steel, the production of this Company being entirely taken up annually in the construction of the Whitely Harvesting Machines.

The Buffalo Scale Company, through their agents, the Oppenheimer Hardware Company, Cincinnati, Ohio, exhibit a line of Postal, Counter, Market, Platform, Grain, Dormant, Stock, and numerous other Scales.

The Bandle Arms Company, Cincinnati, Ohio, display a select line of Sporting goods of every description, Guns, Powder, Shot and Hunting outfits.

One of the best arranged and most comprehensive displays of the Exposition is that of the Fred. J. Meyers Mfg. Company, Covington, Ky., occupying space in the main (Park) Exhibition Hall of 400 sq. feet,

in which is exhibited a large and varied line of their productions, such as Brass and Steel Wire Cloth, Sieves, Garden and Lawn Trellis, Settees, Chairs, &c., Bird Cages, Fire Place Fenders, Wire Office and Bank Screens, Flower Stands, Vases, Weather Vanes, Office and Bank Railings, Window Guards, &c., and a variety of Hardware Novelties, including the famous Hunter Flour Sifters and Mixers, of which a huge pyramid is formed. This firm had the honor of having their Fencing, Window Guard, &c., recommended for use in and about the Centennial Buildings by the Honorable Board of Commissioners.

Johnson Bros., Cincinnati, Ohio, exhibit a line of the Zeck Pattern Axe, of which they are manufacturers, which they claim to be superior in quality and finish, mentioning that none but the finest grade of Steel enters in its construction.

Arrangement of Stroes.

The illustration, Fig. 255, represents a Chain Rack, which is used by Kellogg, Johnson & Bliss, Chicago, of whose establishment we gave a description some time

Fig. 255.—Chain Reels.

ago. The arrangement is, it will be seen, a combination of a Chain Reel and bins. The bins can be used for a variety of purposes, Kellogg, Johnson & Bliss using them for getting together small bills of Builders' Hardware by shipping department, but they will serve admirably for Nails, Horseshoes, &c. The rack consists, it will be observed, of wooden posts with 1/4-inch iron rods extending between them, on which wooden spools revolve. The upper row of rods can be lifted out of its place by means of open slots in the posts. The other rows are arranged with a deep hole on the left post, which will permit the rod when thrust all the way into it to clear the other post and thus be lifted out. The rack is alike on both sides, so that it can be used as conveniently on one side as the other. It is utilized for holding a great variety of Sash Chain, as well as Coil and other Chains.

The London *Engineer* illustrates in its impression of July 6 one set of the twin-screw engines of the great Italian warship *Re Umberto* as they stood in the erecting shop. They will indicate 10,000 horsepower on each screw, and are fitted with Joy's valve-gear. The *Re Umberto* is one of three ships of nearly similar type. She is 400 feet long, 75 feet beam, and, displacing 13,251 tons, will draw 28 feet 6 inches. She is intended to steam at 18 knots, and will carry four 110-ton guns in barbettes.

Lever Latch and Handle.

This article, which is put on the market by J. F. Wollensak, Chicago, Ill., was patented April 24, 1888. It is intended for use on refrigerators, ice boxes, &c. One of the points made in regard to it is that it may be used for either right or left

the pool cable companies to maintain a rate of 25 cents a word, instead of the 12-cent rate that has prevailed for a year.

Cash Register Bank.

This attractive and ingenious toy is put on the market by the Henry C. Hart Mfg.

Mich., to recover a balance on a contract for the construction of the plant of the defendants, which the defendants refused to pay, claiming that the contract had not been completed by the plaintiffs. It appears that in March, 1887, Lean & Blair contracted to build the works of the Detroit Copper and Brass Rolling Mills upon an entirely novel design, which was the conception of Mr. Lean, the senior member of the firm, and that, as the plan of running a copper works with gas fuel was altogether new, the figures of fuel consumption, &c., given by the defendants should be used as the basis from which to determine the number of gas producers that would be required to run the works, including the boilers as well as the furnaces.

When the plant was completed and lighted up last August, it was found to be a complete success, except that the producer capacity was found to be sufficient only to run the furnaces, without the boilers. It was then discovered that the figures given by the company as the basis were incorrect. The plaintiffs then made the company a proposition to build the necessary additional gas producers, which was accepted, but afterward canceled by the company, and, being unable to figure for themselves what was necessary, they called in as an expert a furnace builder, who induced them to make alterations which cost them \$13,000 and then left them just where they were in the first place—with just enough gas to run the furnaces, without the boilers. A verdict was rendered giving the plaintiffs the full amount of their claim, with interest and all costs. The amount involved was \$17,000.

Electric lighting has been successfully tried on the Skane-Holland Railway, in Sweden, where a train was dispatched from Helsingborg, fitted with electric light in all the carriages except one, so as

J. F. Wollensak's Lever Latch and Handle.

doors. That it may thus be reversible, the catch is made in two pieces, permitting either right or left use. The screw in the face of catch clamp is for the purpose of regulating the tension, and by means of this it may be so controlled as to hold the door tight, which is regarded as an improvement over the old method, in which this was accomplished by means of rubber, which is liable to harden and become useless. As indicated in the cut, there is a spring pin in the handle which engages in the notches of the plate, holding the handle in position when unlatched. These handles are made in polished brass, nickel-plated brass and japanned malleable iron and are packed one-quarter dozen in a box, with screws.

The A. & W. Flour Sifter.

A new flour sifter has just been brought out by the Adams & Westlake Company, of Chicago. It is made of tin, with a

The A. & W. Flour Sifter.

concave wire bottom and side-crank with four agitator wires. The crankshaft can be unscrewed and withdrawn, so that the agitator can be lifted out. It is finished with a straight, round scoop-handle, which is claimed to be more convenient than the usual cup-handle. The accompanying illustration will convey an excellent idea of its appearance. It is put up in cases of one dozen, wrapped in six different colors of tissue paper, making a very attractive package.

The cable tariff war has been ended by an agreement between the Commercial and

Company, Detroit, Mich., and is represented in the illustration given herewith, which indicates the special feature which gives name to it. By pressing the button on the top of the safe any amount, from 1 cent to \$9.99, may be registered. The money is inserted in the back of the bank, where there is a device to prevent its being shaken out. The bank is 4½ inches in diameter, and has a brass front, the dial being in bright colors, and the finish of

Cash Register Bank.

the toy being attractive. The bank is packed in a wooden box with a sliding cover, three dozen banks in a case.

A decision has just been rendered by the United States Court at Detroit, Mich., in the suit brought by Messrs. Lean & Blair, engineers and contractors, of Pittsburgh, Pa., last September, against the Detroit Copper and Brass Rolling Mills, of Detroit,

to demonstrate its superiority. There were altogether 17 incandescent lamps in use, fed from an accumulator in the luggage van. The light was very good and steady, and all the lamps could be lighted or extinguished in a moment. The installation has been effected by Messrs. Edwin Audrén & Co., Gothenburg, and it is the intention to fit all the express trains between Christiania and Helsingborg with electric lights.

The Butz Heat Regulator.

Temperature regulation, like ventilation, is among the first and most important considerations, not only in hospitals, churches and schoolhouses, but in private dwellings.

Fig. 1.—Thermostat.

In this climate the severe winters, together with the rapid changes in temperature, make some device by which a uniform temperature can be maintained within doors of the greatest importance, and elec-

Fig. 2.—Automatic Switch Thermostat.

tricity is eminently adapted to perform the office of heat regulation. For this purpose the well-known thermostat (with such improvements as have been recently made) is employed in combination with other devices which operate to effect the regulation according to its indication.

A system of this nature was recently devised by Mr. A. M. Butz, of A. M. Butz & Co., 154 Lake street, Chicago, and is being now introduced in Boston, New York, Chicago and Minneapolis. This system can be applied to any form of heating device, whether steam, hot water or hot air. It can be applied to the heat source in each room, as on the radiator, register or stove, or to the drafts of the heater or furnace, wherever it may be located, either in the basement or in the barn.

The apparatus consists of a thermostat, Fig. 1, located in the reception hall or sitting-room, which by the influence of the temperature closes an opening and a closing electric circuit at the change of 1°. A motor, Fig. 4, is located in the furnace-room, having sufficient power to open and close a set of balanced dampers, or front and check drafts. There is also a battery, consisting of three cells of sufficient energy, it is said, to run the regulating device for three years without attention or renewal. A bell placed in the servant's room and wires to connect completes the system. As it is desirable in residences to have 5° or 10° lower temperature at night than in the day time, Mr. Butz has patented an automatic switch thermostat, as illustrated in Fig. 2. Before retiring it is determined at what degree the temperature should be set for the night by an adjusting screw, and at what time in the morning it is desired to have the temperature raised to the day temperature by turning alarm hand on the clock to, say, five or six o'clock, at which time it will automatically switch the thermostat from 60° to 70° or any other intermediate degree.

When applied to a steam, hot-water or hot-air heater, the motor is fastened to the furnace and a chain attached to the crank of the motor raises the front draft and closes the check draft, when the temperature falls $\frac{1}{4}$ ° below the desired point

ciated by steam users, as no expensive pneumatic appliances are needed for its operation. Three electric wires and two cells of battery in combination with the thermostat is all that is required to shut off

Fig. 3.—Thermo-Electric Valve.

or turn on steam for direct or indirect radiation, and, it is claimed, obtain perfect regulation of temperature in residences, public buildings, hospitals, schoolhouses and conservatories.

Fig. 4.—Outside View of Motor.

in the room above, and immediately reverses the drafts when the temperature exceeds the desired degree where the thermostat is located. When the temperature falls 2° or 3° below the desired degree, a third circuit is closed on the thermostat on which the bell is located, and this will alarm the attendant to supply coal or shake the ashes down. In Fig. 3 is shown the thermo-electric valve for steam radiators which will be at once appre-

As will be seen in Fig. 3, the valve A can be used as an angle or straight-way valve. The steam enters the chamber surrounding the core in which the double valve seats are held closed by the valve stem E and eccentric D. The upper seat being necessarily a little larger than the lower, the steam pressure helps to hold it the more firmly. When the temperature falls, the "opening circuit" on the thermostat is closed, and the motor B re-

volves the shaft and eccentric D, opening the valve seats and allowing the steam and water to pass in and out freely in case the valve is used on the single pipe system. When the temperature rises above the desired degree and closes the "closing circuit" on the thermostat, the motor again revolves the shaft and eccentric D half a revolution, tightly closing the valve seats and shutting off the steam. Should it be required for any reason to open or close the valve without the aid of electricity, this can be done by loosening a set-screw on the eccentric D and resorting to the wheel C to raise or lower the valve stem. This system has been applied in many of the finest residences in Chicago, and a number of testimonials speak highly of its efficiency.

The Eclipse Damper.

An improved stove-pipe damper, a view of which is shown in the engraving pre-

Improved Eclipse Damper.

sented herewith, is being placed upon the market by Charles Millar & Son, of Utica, N. Y. The damper plate is made with an elastic tongue, as shown in the engraving, which permits the spindle to be pushed through the pipe and plate, where it is firmly fastened in place by a malleable button. This button is so placed that when the spindle is in position it not only locks all the parts of the damper, but also tends to prevent the warping of the damper plate. A spring acting upon the stove-pipe and against the collar of the handle causes the damper to retain whatever position it may be placed in. The castings constituting the damper are smooth and carefully finished, the handle being nickel plated. The device is claimed to be very convenient, and is meeting with much favor at the hands of the trade. These dampers are packed in neat cases, each containing three dozen of a size, or they are packed in barrels, as may be preferred. In order to take the damper apart it is simply necessary to turn the button shown in the engraving, press the tongue away from the spindle, when it may be easily withdrawn.

It is officially stated that the contracts between the companies interested have been signed, by which the business of the Jersey Central, Lehigh Valley, Lehigh and Hudson and Ontario and Western railroads will pass over the Poughkeepsie Bridge by a short road which is now being built from the western approach to Montgomery, connecting there with the Erie road. The bridge proper will be completed in four weeks, and all the approaches will be complete in three months. The Storm King Bridge is no longer a rival to the Poughkeepsie Bridge, its charter articles of incorporation and all papers owned by it having been bought by the Poughkeepsie Bridge Company over a year

ago. It has been positively affirmed that the New York Central has captured the Poughkeepsie Bridge, thus heading off the plans of the Pennsylvania Road for an invasion of New England territory, but on this subject reports are contradictory.

The Collins Patent Sprinkler.

In the accompanying illustration is shown an improved form of sprinkling pot just being offered the trade by M. P. Kellogg, of Collins, N. Y. The engraving presents a perspective view of the device, with a portion of the side broken away to show the position of the agitator; also a view of the under side of the nozzle. The sprinkler is made of tin, and especially designed for distributing paris green or other insect poison held in solution or suspension in liquids. A feature of the device is the agitator provided for the purpose of thoroughly mixing the powders or poisons

The Collins Patent Sprinkler.

vertical position. The manufacturer claims that the device has proven very satisfactory for the purpose for which it is intended, and that there is no dripping from the nozzle when the sprinkler is not in use.

Combined Stove and Glue-Pot.

The Cline Mfg. Co., of Chicago, Ill., are offering the trade an improved form of glue-pot and stove combined, a view of which is presented in the accompanying engraving. The device consists of a sheet-iron vessel, with cover and bail divided

Combined Stove and Glue Pot.

into two compartments. The lower one constitutes the fire-box, into which charcoal or any other convenient fuel may be placed, while the upper receptacle is designed for the glue to be heated. The makers state that when Cline's patent aromatic composition fuel is employed the fire burns from the top toward the bottom, and that there is no oil, no blaze and no danger, qualities which should render it popular with those having use for such articles. In order to operate the device the makers present the following directions: Remove the glue-pot and the inside fire-box from the stove; then fill the box with fuel, the top of which sprinkle with a few drops of alcohol, or place a loose wad of paper on top of the fuel; set fire to it and let the same remain out of the stove until the blaze is all exhausted, which will only be a few moments. Remove the burnt paper from the fuel and place the fire-box in the stove, then the glue-pot and cover, allowing the stove to remain in the open air about 15 minutes, when it will be fairly started. Stir lightly about every three hours.

About 40 firms were represented at the annual meeting of the American Association of Window Glass manufacturers, held in this city last week. According to the annual report the production of the association for the year, while large, was not as large as that of last year. Imports were larger than those of last year. During the year about 1300 pots had been in operation, and the production had amounted to about 500,000 boxes for 40 weeks of work. There was stock enough on hand to last for some time. Indications were that next year would see an increased supply. There were over 8500 men in the business and their organization was one of the strongest in the country. Skilled labor was paid from \$3 to \$8 a day, while more was paid for special kinds of work. F. L. Bodine, of Philadelphia, was elected president.

J. H. Lippincott confirms the report that he has purchased all the right in America to Thomas Edison's phonograph. He does not name the exact sum paid for the invention, but it exceeds \$1,000,000. He says that the phonographs are ready for commercial use, and will be on the market before many days. Mr. Edison still owns the foreign patents to the invention.

THE IRON AGE

THURSDAY, AUGUST 2, 1888.

New Side Crank Engine.

We illustrate on this page a new design of plain slide-valve engine turned out by the W. T. Adams Machine Company, of Corinth, Miss., in sizes of 40, 50, 60, 75 and 100 horse-power.

The bed is cast in one piece, lying close to the foundation its entire length, combining strength and solidity. It is held to the foundation by a double line of anchor bolts. The cylinder is bolted to the end of the bed, as shown. The ports in the valve-seat are very large, being as long as the diameter of the cylinder will allow, so as to get steam into the cylinder, use it and get rid of it in the shortest possible time. The steam-chest is bolted to the side of the cylinder. It is of good length

workingman and the State." That was embodied in a resolution expressive of the sense of the Congress upon the subject.

Material for Propeller Blades.

In a paper on "The Material Best Suited for Propeller Blades," recently read before the British Institution of Naval Architects, Mr. W. C. Wallace presented data regarding the strength, durability and cost of propeller blades made from cast iron, steel, gun metal, manganese bronze, phosphor bronze, delta metal, and aluminium bronze.

Until recent years, according to Mr. Wallace, cast iron was the material most generally in use for propeller blades, and is still in favor with some engineers. Its

coating, and thus setting up galvanic action. The present price for finished steel blades is from \$175 to \$200 per ton. Gun metal has been used almost as early as cast iron, but the use was restricted to the Royal Navy and to small private vessels. It has great resistance to corrosion, the life of the blades being in most cases longer than that of the ship; but owing to the galvanic action between the blades on the hull serious pitting would take place in the stern frames and plating if the latter were not protected by placing strips of zinc round the inside of the propeller aperture. The zinc is consumed, but the hull is preserved. The quantity of zinc required for a propeller of 20 feet diameter is about 3 cwt., and must be renewed every 12 or 15 months, at a cost of about \$50. In point

SIDE CRANK ENGINE, BUILT BY THE W. T. ADAMS MACHINE CO., CORINTH, MISS.

and narrow, avoiding long and wasteful steam passages. The cross-head is of the locomotive style, with wide bearing on the guides and is screwed to the piston and secured by a jam-nut. The pillow-block is cast solid to the frame at an angle of 45° and has large and long bearings, lined with anti-friction metal. The crank is counterbalanced, shrunk on the main shaft and secured by a steel key accurately fitted. The wrist-pins of these engines are made so that their diameter exceeds their length in the journal. The overhang of the crank is very much reduced and entire rigidity secured.

Prof. Francis Wayland, whose motion to that effect was adopted by the recent Prison Reform Congress, contends that without productive prison labor the work of prison reform cannot be accomplished. If the prisoner is to be reformed he must have work for his hands to do in which his mind will be interested, or, as the idea is otherwise presented, "that any scheme which has a tendency, direct or indirect, to promote or permit the idleness or unproductive labor of prisoners will inflict irreparable injury upon the prisoner, the

most serious defect is its liability to fracture, and the increase in thickness of the blade necessitated thereby. It is not to be recommended where trustworthiness is a desideratum, but has the advantage of being cheap, of preserving the true form of the screw in casting, and of having a smooth surface. Cast-iron propeller blades require to be renewed every five or six years. The cost of finished blades may be taken as from \$100 to \$120 per ton.

The introduction of mild steel as a material for propeller blades has been a great improvement, rendering them absolutely trustworthy as regards strength, but bringing about the evil of corrosion. The blades become so pitted and broken in a few years that they have to be renewed, and with steel it is not possible, as with cast iron, to burn on new tips. The life of steel blades varies from 3 to 6 years. Many attempts have been made to protect steel blades from becoming pitted by a covering of some other metal. Tin has been applied to the back of the blades near the tip, and brass plates have also been used to cover that portion of the back of the blades which is most subject to corrosion. It is, however, extremely difficult to prevent water from getting behind the

of strength gun metal is only slightly ahead of cast iron, but it is not so brittle. The present price for finished blades is about \$850 per ton.

Manganese bronze, like gun metal, is free from corrosion, but is difficult to cast, and sets up galvanic action, requiring the application of zinc, as already explained. Its price is about \$25 higher than that of gun metal. Phosphor bronze has an ultimate tensile strength of 15.8 tons, and in this respect is not much superior to either gun metal or manganese bronze; but its elongation is 17½ per cent., showing its great ductility. No large propellers have, so far as the author is aware, been made of this metal; but in steam launches and torpedo boats it has been used. The price of finished blades is \$850 per ton. Delta metal, which is an alloy of copper, zinc and iron, and which has a breaking strength of from 15 to 23 tons, with an elongation of from 10 to 20 per cent., has to a limited extent been used for the propellers of sea-going ships; but the author was unable to speak either of its trustworthiness or of its lasting qualities. The price for finished blades was given as \$575 a ton, or five times that of cast iron, and three times that of steel.

Aluminium bronze has up to the present been little used for propellers of any size; but if aluminium brass is all that the advocates of this material claim for it, Mr. Wallace considers it likely that it will be largely used for propellers. An 8½ per cent. aluminium bronze is recommended by one of the officials of the United States Navy for twin screws, but the high price of \$1175 per ton for finished blades renders its adoption in the merchant navy almost impossible. The following table contains a summary of the strength and elongation of the various materials above enumerated:

	Ultimate tensile strength. Tons per square inch.	Elongation. Per cent.	Weight to break bar 1 in. by 1 in., 12 in. be- tween supports. Cwts.
Cast iron.....	10	18
Steel.....	31	10	55
Gun metal.....	14	9	33
Manganese bronze.....	15	28
Manganese bronze (by Bronze and Brass Co.).....	45
Phosphor bronze (by Phosphor Bronze Co.).....	16	17	24
Delta metal.....	19	15
Aluminium brass.....	34	2

Practical experience has led to steel blades being made 25 per cent. thinner at the root than cast iron, while for manganese bronze and aluminium brass an allowance of 30 per cent. may be assumed. Delta metal may be allowed 25 per cent. reduction, and gun metal and phosphor bronze each a reduction of 10 per cent. Making these allowances, the relative cost of blades compared with cast iron is as follows:

	Cost per ton.	Equivalent cost of blades for every ton of cast iron blades.
Cast iron.....	£24	£24
Steel.....	38	33
Gun metal.....	130	144
Manganese bronze.....	135	123
Phosphor bronze.....	170	153
Delta metal.....	115	110
Aluminium bronze.....	145	139

The relative first cost is, however, not the only item of expenditure which must be considered. Shipowners must remember that the renewal of blades and the difference in power consumed are also important matters.

The Operation of the Steam Jacket.

In a recent article on "The Theory of the Steam Engine," the London *Engineer* refers as follows to the mode of operation of the steam jacket:

It is a very crude statement that it does good because it keeps the cylinder hot. It might keep the cylinder hot and yet be a source of loss rather than gain; and, as a matter of fact, it is doubtful now if the application of steam jackets to all the cylinders of a compound engine is advisable. It is well known, too, that circumstances may arise under which the jacket is powerless for good. Thus, for example, the late Mr. Alfred Barrett, when manager of the Reading Ironworks, carried out a very interesting series of experiments with a horizontal engine, in order to test the value of the jacket. This engine had a single cylinder fitted with a very thin wrought-iron liner, between which and the cylinder was the jacket space. The jacket was very carefully drained, and could be used either with steam or air in it. Experiments were made on the brake with and without steam in the jacket. They were repeated alternately, the conditions being in all respects similar to those obtaining during competitive trials by the Royal Agricultural Society. The result

was a practically infinitesimal gain by using steam in the jacket. In one word, the loss by condensation was transferred from the cylinder to the jacket. On the other hand, it is well known that single-cylinder condensing engines must be steam jacketed if they are to be fairly economical. Circumstances alter cases, and the circumstances which attend the use of jackets are more complex than appears at first sight.

In considering the nature of the work to be done, we must repeat a fundamental truth which we have been the first to enunciate. A steam engine can discharge no water from it which it did not receive as water, save the small quantity which results from loss by external radiation and conduction from the cylinder and from the performance of work. At first sight the proposition looks as though it were untrue. Its accuracy, will, however, become clear when it is carefully considered. After the engine has become fully warmed up the cycle of events is this: Steam is admitted to the cylinder from the boiler. A portion of this is condensed. It parts with its heat to the metal with which it is in contact. The piston makes its stroke and the pressure falls. The water mixed with the steam is then too hot for the pressure. It boils and produces steam, raising the toe of the diagram in a way well understood and needing no explanation here. During the return stroke the pressure falls to its lowest point, and the water, being again too hot for the pressure, boils and is converted into steam, which escapes to the atmosphere or condenser without doing work and is wasted. The metal of the cylinder, &c., falls to the same temperature as the water. At the next stroke the entering steam finds cool metal to come into contact with, and is condensed as we have said, and so on. But the quantity condensed during the steam stroke is precisely equal to that evaporated during the exhaust stroke, and consequently no condensed steam can leave the engine as water. Let us suppose for the sake of argument, however, that an engine using 20 pounds of 100-pound steam per horse per hour discharges 2 pounds of water per horse per hour. As each of these brought, in round numbers, 1185 thermal units into the engine and takes away only 212 units, it is clear that each pound must leave behind it 973 units; consequently the cylinder will be hotter at the end of each revolution than it was at the beginning, and the process would go on until condensation must entirely cease.

It will be urged, however, that a steam jacket certainly does discharge water, and that in considerable quantity, which it did not receive; and as this is apparently indisputable, we are here face to face with one of the puzzles to which we have referred. The fact, however, is in no wise inconsistent with what we have advanced. If an engine with an unjacketed cylinder regularly receives water from the boiler that engine will discharge precisely an equal weight of water. The liquid will pass away in suspension in the exhaust steam. The engine has no power whatever of converting it into steam. The case of a jacketed engine is different. Such an engine will evaporate in the cylinder water received with the steam, but it can only do so at the expense of the steam contained in the jacket. For every 1 pound of water boiled away in the cylinder 1 pound of steam is condensed in the jacket, and the corollary is that if an engine was supplied with perfectly dry steam there would be no steam condensed in the jacket, save that required to meet the loss due to radiation and the conversion of heat into work. The effect of the jacket will be to boil a portion of the water during the close of the stroke, and so to keep up the toe of the diagram, and so to get more

work out of the steam. If, however, the steam was delivered wet to the engine it is very doubtful if the jacket could be productive of much economy. The water would be converted into steam during the exhaust stroke, and no equivalent would be obtained for the steam lost in the jacket.

In a good condensing engine about 3 pounds of steam per horse per hour are condensed in the jacket. The cylinder will use, say, 15 pounds of steam, so that the total consumption is 18 pounds per horse per hour. It is none the less a fact, although it is not generally known, that the average Lancashire boiler sends over about 8 per cent. of water in the form of insensible priming with the steam. Now, 8 per cent. of 18 pounds is 1.44 pounds, so that in this way we have nearly one-half the jacket condensation accounted for, as just explained. One horse-power represents 2562 thermal units expended per hour, or say 2.6 pounds of steam of 100 pounds pressure condensed to less than atmospheric pressure; and $1.44 + 2.60 = 4.04$ pounds per horse per hour, as the necessary jacket condensation if no water is to be found in the working cylinder at the end of each stroke. That this quantity is not condensed only proves that the water received from the boiler, or resulting from the performance of work, is not all re-evaporated.

Something still remains to be written about the true action of the steam jacket, but this we must reserve for the present. We have said enough, we think, to show that, as we have stated, the jacket has more to do than keep the cylinder hot. With jacketed engines more than any others it is essential that the steam should be dry. In the case of an unjacketed engine water supplied from the boiler will pass through the engine as water and do little harm, but if the engine is jacketed, then the whole or a part of this water will be converted into steam, especially during the period of exhaust, when it can do more good than if it were boiled away in a pot in the engine-room. This is the principal reason why such conflicting opinions are expressed concerning the value of jackets. That depends principally on the merits of the boiler.

Japanese Lacquer for Iron Ships.

—The Japanese Admiralty has finally decided upon coating the bottoms of all their ships with a material closely akin to the lacquer to which we are so much accustomed as a specialty of Japanese furniture work. Although the preparation differs somewhat from that commonly known as Japanese lacquer, the base of it is the same—viz, gum-lac, as it is commonly termed. Experiments, which have been long continued by the Imperial Naval Department, have resulted in affording proof that the new coating material remains fully efficient for three years, and the report on the subject demonstrates that, although the first cost of the material is three times the amount of that hitherto employed, the number of dockings required will be reduced by its use to the proportion of one to six. A vessel of the Russian Pacific fleet has already been coated with the new preparation, which, the authorities say, completely withstands the fouling influences so common in tropical waters. It occupied the native inventor for many years to overcome the tendency of the lac to harden and crack, but having successfully accomplished this, the finely polished surface of the mixture resists in an almost perfect degree the liability of barnacles to adhere or weeds to grow, while presumably the same high polish must materially reduce the skin friction which is so important an element affecting the speed of iron ships. The dealers in gum-lac express the fear lest

the demand likely to follow on this novel application of it may rapidly exhaust existing sources of supply.

Swedish Bar Iron and the English Merchandise Act.

Some recent decisions by the English customs authorities respecting the marking of Swedish bar iron in accordance with the Merchandise Marks act are said to be causing great alarm among Swedish iron manufacturers, and to have led to diplomatic negotiations between the English and Swedish Governments. As is generally known, a large quantity of Swedish bar iron imported into this country bears the words "Lancashire-Swedish," or "Lancash-Swedish," which designation has hitherto obtained for it a free entry. Now, however, the English custom authorities, guided by the provisions of the new act, have decided that, unless the bars in addition bear the words "manufactured in Sweden," or "produced in Sweden," all such imports will be forfeited to the British Crown. This has given rise to great excitement, and even indignation, in Sweden, as it is considered that we are treating Swedish iron with undue severity, and that, considering the benefit the English iron industry derives from the imports of Swedish bar iron, and its re-export in the finished state, the trade should be rendered every facility. The Swedish minister in London is said to have received instructions to urge upon the English Government the advisability of relaxing the severity of this clause in the act in favor of Swedish-Lancashire iron. An adverse decision would, it is urged by those interested in the trade, be very serious, as there are large stocks of bar iron on hand in Sweden with the old brand. Several Swedish journals also take the opportunity of pointing out that, according to the new law, it is forbidden—under pain of forfeiture—to import into England, as has hitherto been done, Swedish made iron bearing the name or brand of some English manufacturer or dealer, even if affixed at the request of the firm in question, and even if accompanied by a written certificate to that effect.

London *Iron* says: "We trust the English Government will not allow itself to be persuaded to relax the due administration of the provisions of the Merchandise Marks act in the least, either in the case of Sweden or any other country, for the act is doing immense good to English industry. As to the request of the Swedish Government said to have been addressed to our Government, it seems rather a cool proceeding on the part of Sweden, after the passing by its legislature of a highly protective tariff, to ask for consideration. It is an unblushing proceeding, and the sooner Swedish manufacturers and exporters, and the Swedish public generally, are made to see the matter in its true light, the better for the amicable relations of the two countries."

The Steamer Puritan.—The launch of the side-wheel steamer Puritan, at Chester, Pa., July 25, was attended by a number of distinguished builders and engineers. The Puritan, a sister ship to the Pilgrim, built at the same yards six years ago, is 420 feet over all, 404 feet on the waterline, 52 feet beam, 91 feet breadth above guards, 20½ feet hold, 63 feet height of dome from floor and draft of water 12 feet; gross tonnage, 4650 tons; estimated displacement, 4200 tons. She will be propelled by compound beam engines. The low-pressure cylinder will be 110 inches in diameter, 14 feet stroke, and the high-pressure one will be 75 inches in diameter and 9 feet stroke. There will be eight steel return tubular boilers averaging 7500

horse-power. The vessel is expected to develop a speed of 21 miles per hour. Her hull is of steel, built on the longitudinal and bracket plate system of naval architecture. She has 56 water-tight compartments and six water-tight bulkheads. Her main deck is of steel and she is unsinkable and fire-proof. Her saloon and stateroom accommodations will be superbly finished in the choicest woods and finest upholstery and she will have 110 more staterooms than the Pilgrim. Her steering-gear is worked by steam. The gullows-frame for the walking-beam is constructed of steel and iron and weighs 35 tons. Nothing in the way of American inventive genius that money can procure will be lacking in this handsome vessel to afford safety to passengers. Her cost will be \$1,500,000. She will be ready some time next season to take her place on the line from New York to Fall River. She will receive her boilers and machinery in this city.

Natural Gas Suit.

A very important suit to all natural gas consumers, and which will result in the determining the power of the courts in the matter of fixing the rates for natural gas, was commenced in the courts at Pittsburgh on Friday the 20th ult. It is in the form of a bill in equity, filed by the Faraday Carbon Company against the Philadelphia Natural Gas Company. The Faraday Carbon Company are engaged in the manufacture of carbon points for electric lights, and operate large works in the above-named city. The bill alleges, first, that the Philadelphia Company are common carriers, and as such exercise the right of eminent domain and have obtained great privileges from the Pittsburgh City Councils. It is further asserted that the Philadelphia Company have entered into a fraudulent and illegal combination with the Pennsylvania and the Chartiers Natural Gas Companies for the purpose of increasing the price of natural gas furnished to the public, and by reason of this combination the plaintiffs can at present only obtain a supply from the Philadelphia Company.

The plaintiffs were notified last June by the officials of the Philadelphia Company that the price of gas was to be largely increased, and a new contract would have to be signed. The plaintiffs thereupon determined to abandon the use of gas as fuel under their boilers, but to continue it for their heating furnaces, ovens and other machinery. This the Philadelphia Company refused to permit, and insisted that if any gas at all was furnished it would have to be used in all the operations of the factory. The price asked for the gas was equal to about 9 cents per 1000 feet, while, it is alleged, other persons are being supplied at rates ranging from 3 to 5 cents per 1000 feet. The plaintiffs offered to pay a reasonable price, but it was refused, and they were notified that the gas would be shut off from the factory unless the new contract was signed at once. The Faraday Carbon Company assert that if the gas is cut off, as threatened, they will suffer great loss, and therefore wish the Court to intervene. The Court is asked to grant an injunction to restrain the Philadelphia Company from cutting off the supply of natural gas; to fix a reasonable price at which the gas shall be furnished, and to set aside as void the combination between the Philadelphia, Pennsylvania and Chartiers Companies.

The Louisville and Nashville Railroad Company advertised for bids for 500 freight cars a few days ago, and bids were received from 11 car-building companies, the figures ranging from 5 per cent. to 10 per cent. lower than last year's prices.

New Coke Furnace at Mayville, Wis.

The blast furnace at Mayville, Dodge County, Wis., is now in successful operation, having been blown in on the 1st ult. It is practically a new furnace, although it consists in part of the charcoal furnace long operated by the Northwestern Iron Company, of Milwaukee. The local ore, to smelt which this furnace was originally built, is a fossil ore, similar in many respects to the Clinton ore of New York, but it decrepitates very easily, and being found usually in small detached pieces it is locally known as flaxseed ore. Owing to its fineness it had been found somewhat difficult to handle in the old furnace, which therefore ran but irregularly. The deposit is so immense, however, that the owners desired to turn it to more profitable account, and, consulting with the well-known engineer, John Birkinbine, of Philadelphia, they concluded to take his advice and remodel their furnace to use coke. The work of reconstruction was put in his hands, and his ideas were embodied throughout.

The dimensions of this furnace now are 65 feet high and 13½ feet diameter at back. The old boilers were retained, and two batteries of new boilers were added, each consisting of two upper boilers, 44 inches in diameter and 60 feet long, with two 14-inch flues and two lower boilers, 38 inches in diameter and 26 feet long. The hot-blast apparatus consists of two 24-pipe Weimer suspended stoves. A Weimer blowing engine having a blowing cylinder, 6 feet in diameter, with a 4-foot stroke, supplies the blast. A Crane hoist elevates the stock by an inclined plane to the tunnel head. The fuel used is exclusively Connellsville coke. Limestone is obtained in the immediate vicinity of the ore beds. The ore now used consists of about 50 per cent. of the local fossil ore and 50 per cent. Lake Superior ore. The local ore is mined very cheaply, being shoveled from the bed into the cars, and is very clean, requiring no preparation for the furnace, and works well with Lake Superior ore in making a good foundry pig iron at low cost. The furnace is located within such a convenient distance of the soft ores of the Menominee and Gogebic ranges that their use in connection with the local ore will enable the furnace company to make a variety of pig iron to suit the demands of the market.

The furnace is now yielding about 50 tons of pig iron daily, but it is not yet working up to its capacity, as the owners are experimenting on mixtures and have, therefore, been obliged to proceed carefully, watching the result of every change. An increase of 20 per cent. in this production is expected soon and much better results are predicted when perfect smoothness of operations is secured. A large output of pig iron is, however, not the only result aimed at. The local fossil ore is an ideal basic ore containing the proper contents of phosphorus and silica for the manufacture of basic pig iron. The opportunity will exist in operating this furnace to demonstrate whether the ore can be easily and profitably smelted for the manufacture of basic steel. The owners have strong faith in the ultimate value of their ore property and propose to ascertain what it is really worth for metallurgical purposes generally.

The furnace will be known as the Mayville Furnace and the pig iron will be marketed as the Mayville brand. Pickands, Brown & Co., 115 Dearborn street, Chicago, are exclusive sales agents. The Spring Lake Iron Company, of Milwaukee, are operating the furnace as lessees from the Northwestern Iron Company. I. M. Bean is president of the company and H. S. Fleming is superintendent of the furnace.

The Tabor Sand Molding Machine.

Sand molding machines for general foundry work have become recognized as labor-saving devices of no small importance, and every new and tried design of this class is therefore of interest. We take pleasure, accordingly, in giving on this page and the one opposite illustrations of the Tabor machine, built by the Tabor Mfg. Company, 111 Liberty street, New York.

It has always been customary for the molder to pack the sand around the pattern with a hand rammer. This gives him a chance to anticipate the varying depths of the pattern, and to ram more or less as the

and any number of castings made from such molds will have a uniform weight and will be true to the pattern. The value of this exact duplication is two-fold and cannot be overestimated; it means economy in material and a large saving in labor if castings are to be fitted or finished.

In the Tabor machine the pressure exerted on a mold is not affected by the amount of sand in the flask—for instance, if more sand than is required be used, the mold will not be harder nor will it be softer if less sand be used, as in either case the downward motion of the rammers ceases when the resistance of the sand equals the pressure on the piston. It is only necessary to see that enough surplus sand is

ward projecting lugs in contact with reverse projections on the pattern frame in the truck, thus relieving the truck and its outside framing of all strains due to the pressure of ramming and insuring the pattern being forced into the sand its full depth. The upper ends of the strain-bars pass between flanges on the sides of the cylinder and are secured by steel pins. Through the upper ends of the bars and the cylinder-flanges are a number of holes for raising or lowering the cylinder to suit the different depths of flasks.

The operation of molding is as follows: The pattern being set, one-half the flask (cope or nowel) is put on the plate, joint-side down. On top of the flask is placed

Fig. 1.—Ready for Flask.

Fig. 2.—Flask Under, Ready for Ramming.

NEW SAND MOLDING MACHINE, MADE BY THE TABOR MFG. CO., NEW YORK.

depth of the sand requires, so as to get a mold uniform in density around the pattern. This is simply a question of judgment with him, which is sometimes good, but frequently bad. In fact, he may ram the mold so hard that the gases cannot escape in pouring, and the casting will "blow;" and at other times make the mold so soft that the casting will "strain," in either case making bad work. The molder draws his pattern by hand, and should the pattern have considerable depth, with little draft, it will be necessary to rap it sufficiently to loosen it so that it may be drawn without breaking the mold. This is objectionable, as more rapping in one case than another makes the mold larger, and consequently the casting is heavier, thus wasting iron. It necessarily follows that if the molds are rammed with equal pressure, and the pattern drawn from the sand without rapping, each mold will be a perfect duplicate of the other,

used to allow for the compression, which means simply to fill the sand box. When the machine rams a mold all the sand in the flask is pressed down in one unbroken body, packing the sand uniformly and leaving the mold, it is claimed, more porous than when made by hand, and venting is therefore required.

The machine consists of a base with extending tracks for a truck or carriage and upright columns, between which is an inverted cylinder. Into this cylinder is fitted a piston and rod, the lower end of which is provided with a group of rammers or pressers. A pair of strain bars are, moreover, provided, which, when ramming, relieve the uprights, and there is, finally, a movable truck on which the pattern and flask are placed. The strain-bars are supported by steel pins, which pass through slotted holes in the lower ends of columns. These slotted holes allow the bars to lift and bring their in-

a sand-box of sufficient depth to hold the surplus sand used in compression. The flask and sand-box are then filled with sand from a hopper overhead (or it may be shoveled in by hand); the truck is run under the machine, steam turned into the cylinder above the piston and the rammers or pressers are forced downward on the sand. When the rammers cease their downward movement the sand is thoroughly and uniformly packed; the steam is then exhausted from the upper side of the piston and admitted to the under side and the hammers raised to their former position; the truck is withdrawn from under the machine, the sand-box removed, the top of the flask "struck off" and the pattern drawn downward from the mold through the stripping-plate, or drawn by hand in the usual way if no stripping-plate be used. One-half of the mold is now finished and ready to go on the floor. The operation will be more clearly un-

derstood by examining Figs. 3 and 4. In these the following references are used: A, pattern; B, pattern-plate; C, stripping-plate; D, cross-head or pattern frame for drawing pattern; E, stool or column for holding up sand; F, cranks. When the pattern is to be drawn by hand, a plane-plate is used on top of the machine, on which is placed the pattern, or follow-board and flask.

The group of rammers is made in size to suit the flask for which the machine is intended. These rammers are so arranged on equalizing levers that each rammer receives its share of the pressure and has a movement independent of the others, so that over a pattern where the sand is deeper under one rammer than under another, the one over the greatest depth of sand may go down until the mold is uniformly packed. On account of the friction of the sand on the sides of the flask, the marginal rammers are attached to the shorter ends of the levers, so that they may get an increased pressure equal

per day will, under unfavorable circumstances, equal the work of four molders, and under favorable conditions the product will equal the work of double that number. Two more men with an extra truck, working on the opposite side of the machine, will double the capacity.

The machine is now in use at the works of the following firms: The Pond Machine Tool Company, Plainfield, N. J.; B. W. Payne & Sons, Elmira, N. Y.; the Union Switch and Signal Company Swissvale, Pa.; the Cooke Locomotive Works, Paterson, N. J.; the Solid Steel Company, Alliance, Ohio, and Westinghouse Air Brake Company, Pittsburgh, Pa.

Surface Condenser Calculations.

In the paper on "Surface Condensers," presented at the recent Nashville meeting of the Society of Mechanical Engineers and briefly referred to in our report at the time, Prof. J. M. Whitham, the author,

a decrease of 10 per cent. will suffice in Arctic waters.*

Professor Marks† gives the formula:
Condensing surface in square feet =

$$\frac{W(H - T)}{0.1 \text{ to } 0.2 C(T - T')}$$

Where W = pounds of steam sent to the condenser per hour.

H = total heat units in 1 pound of steam at the boiler.

T = mean temperature of the circulating water.

T' = temperature of the vacuum.

C = 556.832 for brass and 642.543 for copper tubes, as found by Isherwood, and shown in the table of § 4.

Professor Whitham, in passing on to a formula which he proposes, remarks that the area of the condensing surface depends upon the quantity, quality and temperature of the exhaust steam, the initial and final temperatures of the circulating water, the character of the exposed surfaces and

Fig. 3.—Section through Pattern, Ready for Flask.

Fig. 4.—Section Showing Pattern Drawn through Stripping Plate.

NEW SAND MOLDING MACHINE, MADE BY THE TABOR MFG. CO., NEW YORK.

to the friction, and prevent the molds from dropping when the flask is handled. The piston has sufficient stroke to allow for a change of 3 inches in the depth of cope or nowel without changing the position of the cylinder. A pan surrounds the piston-rod just above the rammers, which catches any drip from steam or water that may come from careless packing of the stuffing-box; this prevents any wetting of the sand.

It is recommended that a sand conveyer, elevator and riddle for handling the sand be used. The conveyer running through the center of the floor carries the sand to an elevator, which raises it to the riddle, through which it passes into the hopper over the truck; from the hopper it is dropped into the flask as required. Sand handled in this way is thoroughly broken up and evenly tempered. While the sand elevator is an important factor in the economy of the system of molding, it is not a necessity. The machine can be used very profitably without it. Any pressure medium, such as water or compressed air can be used in the rammer cylinder, but steam, for several reasons, is considered preferable. As to the output of the machine we are told that with one truck and two men the amount of work turned out

gave attention to several methods used in calculating condensing surface.

Among them he referred to the following formula by Rigg, in his work on "The Steam Engine": Condensing surface in square feet =

Pounds of steam condensed per hour

8.93 to 7.81

This formula permits about 8000 British heat units to be transmitted through a square foot of condensing surface per hour and assumes that about 1000 units are given up by each pound of steam condensed.

Seaton* gives the following proportions, when the circulating water enters the condenser at a temperature of 80° F.: (I. Absolute terminal pressure of steam in the condensing cylinder. II. Square feet of condensing surface per indicated horsepower),

I.....	6	8	10	12.5	15	20	30
II.....	1.50	1.60	1.80	2.00	2.25	2.50	3.00

When the vessel is to cruise in the tropics the values given in the table must be increased 20 per cent.; when she occasionally visits the tropics, 10 per cent.; while

* Manual of Marine Engineering, by A. E. Seaton, p. 198.

the metal used. The methods given by Rigg and Seaton do not cover all the requirements. Professor Marks's rule is not exact, because the heat given up by the steam to the circulating water is not nearly so great as $W(H - T)$, and because the wide range in the value given to the thermal conductivity of the metal—i. e., from 0.1 to 0.2 C. is misleading.

In studying the action of the surface condenser, Professor Whitham makes the following assumptions, as warranted by the experiments given in §§ 3, 4 and 5, viz.:

1. The temperature of the steam side of the tube is uniform throughout its length (Joule), and the steam is saturated at a temperature corresponding to the reading of the vacuum gauge. This latter assumption, though arbitrary, is probably suffi-

* P. A. Engineer John A. Tobin, U. S. Navy, in his report on the "Improvements in Naval Engineering in Great Britain" (Ex. Doc. 48, Forty-seventh Congress), gives "The proportion of condensing surface to the horsepower in 15 of the most recent (1883) types of high-speed merchant steamers by the best Scotch builders averaged 1.86 to 1. This proportion compared with the data of seven steamers, taken from a paper read before the Institution of Mechanical Engineers by Sir F. J. Bramwell in 1872, having a ratio of 3.18 to 1, shows the saving effected in this direction during the past ten years.

† § 86, Marks's "The Steam Engine," 1887.

ciently exact, since (a) the fluctuations of the reading of the guage are inappreciable; (b) the exhaust port is opened and closed gradually, steam is exhausted throughout all or nearly all of the stroke of the piston, and the steam is condensed as soon as it arrives in the condenser; (c) the steam in the cylinder, at the end of its expansion, is almost certain to be wet, even with steam-jackets, and this wet steam, on account of free expansion during the exhaustion, is saturated when it reaches the condensing surface. This is still further probable because the condenser pressure is always several pounds below the terminal pressure in the condensing cylinder.

2. The temperature of the water side of the tube has a value equal to the arithmetic mean between the initial and final temperatures of the circulating water.

3. The conductivity of the surface is increased as the quantity of circulating water used is increased. This quantity of water will vary inversely as its rise in temperature.

4. The number of heat units transmitted per hour through a unit surface depends directly upon the difference between the temperature of the sides; varies with the material used, and is independent of the thickness of metal used for the tubes, as found in ordinary practice.

The formula which he deduces is of the following form :

$$S = \frac{W L}{180(T - t)},$$

in which S represents the condensing surface in square feet; T , the temperature of the steam in the condenser, or that of saturated steam corresponding to the pressure indicated by the vacuum gauge, in degrees F.; t , the mean temperature of the circulating water; and L , the latent heat of saturated steam at the temperature T . This formula applies to an engine having an independent circulating pump. When the pump is worked by the main engine, the value of S should be increased about 10 per cent.

The value of W , the pounds of steam sent to the condenser per hour, will vary with the type of engine used, initial pressure of steam, ratio of expansion, and whether the cylinders are steam-jacketed or not. No more reliable data are accessible on this point than the results of Messrs. Loring and Emery, and here summarized, viz. :

Type of condensing engine.	With or without a steam-jacket.	Absolute steam-pressure in boilers. Pounds per sq. inch.	Pounds of steam used per I. H. P. per hour.	Condensing surface. I. H. P.
Two cyl. compound, 90°.....	With.	55	22	2.08
Two cyl. compound, 90°.....	With.	85	18.4	1.74
Non-compound.....	With.	27.5	33 to 37	3.12 to 3.5
Non-compound.....	With.	55	22 to 26.5	2.08 to 2.53
Non-compound.....	With.	85	20.5 to 25	1.94 to 2.36
Non-compound.....	Without.	27.5	40 to 44	3.78 to 4.15
Non-compound.....	Without.	50	26.7 to 31	2.54 to 2.93
Non-compound.....	Without.	85	21.7 to 25	2.05 to 2.36

In designing, Professor Whitham points out, it is never well to anticipate a vacuum exceeding 25 inches of mercury when the engines are developing full power. This corresponds to about 2.5 pounds pressure. So that $T = 135$ and $L = 1020$, and may be reduced to

$$S = \frac{1020 W}{180(135 - t)} = \frac{17 W}{3(135 - t)}$$

The value of t will vary with the quantity of circulating water used and the season of the year. It being the arithmetical mean of the initial and final temperatures of the circulating water, is about 60 in the winter and 75 in summer. Since the larger value of t gives the greater value of S , we will substitute $t = 75$, and becomes

$$S = \frac{17 W}{3(135 - 75)} = \frac{17 W}{180}$$

The pounds of circulating water required per hour is as

$$\frac{W(L + T - T)}{R}$$

T being the temperature of the condensed steam as it leaves the condenser—i. e., the temperature of the hot well and R the rise in temperature of the circulating water.

A Texas Iron Enterprise.

Texas is to become more notable than it has been in iron manufacturing, a new company, the Cherokee Land and Iron Company having been formed to work the brown hematite of Cherokee County. The State has for years manufactured iron at Rusk, Texas, and the new company, which control about 20,000 acres of iron and timber lands, is to build a 50-ton furnace at New Birmingham, a projected town. The enterprise is being conducted by H. H. Wibirt, of New York; R. L. Coleman, of St. Louis, and A. B. Blevins. Mr. John Birkinbine, of Philadelphia, has made a report on the property from which the following extracts are taken: "The ore deposit is remarkable for its apparent uniformity, and exhibits greater regularity as to stratification than any brown hematite ore field of which I have cognizance. When the hills are of sufficient elevation, the ore appears with remarkable persistency as a nearly horizontal bed, which crops out along the sides and near the crests of the hills forming the rolling country of the neighborhood. The entire formation is of a late geological age, probably tertiary. A section would represent a soft sandstone, remarkably free from grit in many places, resembling in color and the ease with which it can be cut or turned when freshly quarried, the caenstone of France. On this the ore lies with a seam of clay, generally between the ore and the stone. The ore is capped by a thin layer of feruginous sandstone, while on top of this is the sand. The ore is brown hematite, varying in physical structure from compact masses to laminated and in some cases coarsely granular ore, and in color from light brown to nearly black; occasionally a glossy surface and incipient pots and botryoidal forms are found in the tules resulting from ledges breaking away, bowlders and fine ore abound, the latter forming a decided "blossom." The

thickness of ore and 3 feet average thickness of sand stripping, taking out the ore by benching:

The cost of winning 1 ton of raw ore is estimated at.....\$0.65
Allow for loss 20 per cent. in roasting.....0.13
Cost of roasting.....0.17
Hauling or tramping to the blast furnace. 0.18

Cost of 1 ton of roasted ore.....1.13

These figures will probably be reduced in the earlier history of a new enterprise, as the initial stripping will be light, but it should safely represent the cost of ore for a series of years and permit the assembling ores from various points which may vary somewhat in physical character or chemical constituents. Using the data as given, the following estimate of the cost of producing 1 ton of charcoal pig iron from local ores is presented:

Cost of Making 1 Gross Ton of Charcoal Pig Iron.

2 tons of roasted ore at \$1.13.....\$2.26
4-10 ton of limestone at \$2.50.....1.00
110 bushels of charcoal at 6 cents.....6.60
Labor at furnace.....1.45
Office and superintendence.....0.35
Incidentals and supplies.....0.30
Interest depreciation and repairs.....1.00

Total.....\$12.96

Or, say, \$13 for a gross ton of iron ready for shipment.

The results obtained at the Rusk penitentiary demonstrate that the ores obtained from the district under consideration produce an iron eminently adapted for foundry purposes, having tenacity, fluidity and chilling properties. Immediately joining the State furnace is a pipe foundry, where cast-iron water pipe are made from iron run direct from the blast furnace into a large receiving ladle. As these pipes, to meet the requirements of engineers' specifications, must be cast thin, and subjected to a hydrostatic test, under a pressure of 300 pounds per square inch, some of the qualities of the iron are exhibited in their manufacture. An examination of broken pieces of pipe or casting showed a very satisfactory fracture.

The foundry inside of the penitentiary walls produced most of the castings, amounting in value to about \$100,000, for the new State Capitol building at Austin, Tex., some of which were long fluted columns, others ornamental orioles, &c., and in addition made stove and other castings. Upon the output of the foundry considerable machine work was necessary, and an investigation of the work in progress in the machine shop demonstrated that the iron was well adapted to treatment by the various tools.

The Marshall Car and Foundry Company, at Marshall, Tex., use the pig iron produced at the State blast furnace alone in the manufacture of car wheels regularly, and during my late visit a contract was made to supply a new car-wheel foundry at Houston, Tex.

Pig iron which so well answers the requirements of foundry practice should find a good market in a State of such vast dimensions, and which is making so many rapid strides in internal development as Texas, and the demand for foundry irons is now, or very soon will be, more than equal to the capacity of an iron furnace of moderate size. The only information concerning the use of the pig iron made from the Cherokee County ores in rolling mills show that it could be puddled and made into bar iron or other shapes. The Helmbacher Forge and Rolling Mill Company, of St. Louis, made the following test: A bar $\frac{1}{4}$ inch square, separated under a tensile strain of 54,200 pounds, equal to 60,000 pounds to the square inch. The elongation in a 6-inch bar $\frac{1}{4}$ inch square was $\frac{1}{4}$ inch in 6 inches. The result of the examinations made lead to the following conclusions:

1. That the ore deposits of Cherokee County, Texas, are of such extent as to

encourage their utilization by the erection of blast furnaces to smelt their ores.

2. That the pig iron produced will be of a character for which there will be a ready demand in the district most conveniently reached.

3. That there is an abundance of wood of good quality for producing charcoal at very satisfactory rates.

4. That the flux, while now costing too much per ton of iron, can be reduced to a cost which will not interfere with the financial success of a blast furnace enterprise.

5. That labor is abundant and the character of the adjacent country is well adapted for its sustenance.

over from the previous year. The foreign indebtedness incurred in various loans somewhat exceeds \$34,000,000, but is nearly all funded through the Rothschilds at 4½ per cent. interest. The Chilians are importing relatively increasing quantities from the United States of our staple manufactures.

Steam Generator for Stock Raisers.

It has been demonstrated to the satisfaction of intelligent stock raisers that food, when cooked, is more economical and will give much better results than an even greater amount of uncooked food.

STEAM GENERATOR FOR STOCK RAISERS, MADE BY MESSRS. GOULDS & AUSTIN, CHICAGO, ILL.

6. That a blast furnace well located could command a trade which would allow of a very satisfactory profit on its output, with no immediate fear of damaging competition from other sources.

7. That supplies of mineral fuel suitable for iron manufacturing can be brought to the district so as to encourage other industries.

The enterprising little republic of Chili, with its population of only about 3,000,000, is making astonishing progress. The last report of the Chilean Secretary of the Treasury shows that during the last ten years the revenues and foreign trade of the country have more than doubled. The Government, which in 1866 could count upon little more than \$9,000,000, and in 1877 upon an income of a little under \$17,000,000, now estimates an income for 1888 amounting to \$36,000,000, to which is added a surplus of \$8,000,000 carried

When cooked, the food is more easily assimilated, but when fed raw a large proportion is not acted upon by the gastric juice of the stomach. The accompanying illustration, showing what is known as the Austin Steam Generator, will therefore prove of interest. It is primarily intended for cooking feed and heating water for stock, but it can be used also for boiling water for slaughtering, heating water for the bathroom, boiling water for the laundry, for canning and drying fruit, renovating feathers, and many other purposes of a similar character. The fire is completely surrounded by water, the water spaces on the sides and end of the steamer measuring 2½ inches. The boiler is provided with test cocks, a safety valve and a blow-off cock. The latter is placed at the lowest water point, permitting the blowing off of all sediment. The boiler will burn wood, coal or cobs. The fur-

nace door is large, and the fire easily started and maintained. A return flue is provided.

The capacity of the generator is ten pails of water, and it is claimed that steam can be raised in 15 minutes. It is made by Messrs. Goulds & Austin, 167 and 169 Lake street, Chicago, Ill., heavy material being used, and all seams being securely riveted with as much care as is used in the manufacture of regular type of steam boiler.

Trade and Presidential Elections.

Many people, says the New York *Journal of Commerce*, are puzzled to understand why the year of the presidential election should be a dull year for general trade. They argue that it takes as much food to support life one year as another; they insist that clothes wear out as fast during these 12 months as in any other; that houses built in the quadrennial year last as long as if erected at any other period—in short, that the prevalent indisposition to engage as actively in buying and selling and building during the progress of this political canvass is totally unreasonable. They hold that if people only thought so, the trade might be as active at the height of the campaign as if no such contest was taking place.

They hit it exactly in saying that trade might now be as active as at this date last year "if people only thought so," but it is the thought that makes all the difference. There is no more potent factor in the business world than the prevalent impression concerning the prospects of trade. If the retailer thinks there will be a large demand for goods he will order a larger stock, and the jobber will contract for more liberal supplies with the manufacturer and the importer, and this creates an active season, but it sometimes happens that the retailer is mistaken, and his increased purchases remain on his hands. He thought there would be a large demand for distribution, and he finds himself mistaken, and his groaning shelves and well-packed storehouses testify against him. To make it certain the movement must originate further back than the dealer. The moment that the mass of the people think that the time has come to buy the activity begins in good earnest. The duller intellect will agree that if there is to be a rush of business those who buy earliest will buy cheapest and have the best selections. This sets the wheels in motion and as far onward as the connection is maintained the activity is sure to be felt.

It is difficult, perhaps, to say exactly how the idea that the year of the election is not a good year for business gained ascendancy at the first, although we may without any great stretch of imagination trace it to purely natural causes. During a very exciting political contest those most deeply interested would, by force of circumstances, do less buying in the market. The busy politician would have less time to give to repairing his house, or replenishing his wardrobe, or restocking his stable, or attending to the score of other things calling for the expenditure of money. Then, not a few are hopeful that in some way their fortunes will be bettered by the result of the election, and they postpone their outlay for this reason. But the fact that so many people have something else to think about, and that, too, upon a topic quite absorbing in its character, will naturally divert their minds from projects little or great which involve the opening of the purse.

Dealers are very quick to observe such change, and they have come to see that when the public mind is thus occupied the stock of goods does not go off as freely, and by a wise forethought they give smaller orders in anticipation of such

a result. Let there be a common apprehension of some impending calamity, as of a coming pestilence, or a drouth, or an army of caterpillars, and the volume of trade, however active it has been up to that time, shrivels in amount. It is only a thought; no one has the cholera or the scarlet fever; no fields have been dried up or scorched, or devastated, but the dread of it paralyzes the movements of trade.

Midsummer Iron and Steel Statistics.

DECREASED PRODUCTION OF PIG IRON, BESSEMER STEEL, AND STEEL RAILS IN THE FIRST HALF OF 1888.

The American Iron and Steel Association have received from the manufacturers complete statistics of the production of pig iron, Bessemer steel ingots and Bessemer steel rails in the United States in the first six months of the present year; also complete statistics of the stocks of unsold pig iron in the hands of manufacturers or their agents on the 30th day of June last.

PIG IRON.

The total production of pig iron in the United States in the first six months of 1888 amounted to 3,382,503 net tons of 2000 pounds, or 3,020,092 gross tons of 2240 pounds. Our production in the last six months of 1887 was 3,771,996 net tons, or 3,367,853 gross tons. The production in the first half of 1888 was 347,761 gross tons less than in the second half of 1887, but it was only 29,203 gross tons less than in the first half of 1887. The production in the last five half years has been as follows, in both net and gross tons.

Production.	Net tons.	Gross tons.
First half of 1886.....	2,954,209	2,637,687
Last half of 1886.....	3,411,119	3,045,642
First half of 1887.....	3,415,210	3,049,235
Last half of 1887.....	3,771,996	3,367,853
First half of 1888.....	3,382,503	3,020,092

Our decreased production in the first half of 1888 was wholly in Bessemer pig iron, as the following figures will show.

	Last half 1887.	First half 1888.
Gross tons.....	3,367,853	3,020,092
Total production.....	1,561,061	1,178,508
Foundry & mill pig iron.....	1,906,792	1,841,584

These figures show that the production of foundry and mill pig iron in the first half of this year was slightly in excess of the last half of 1887. But the decrease in Bessemer pig iron was very great.

All the important Northern and Western pig iron producing States show a decreased production of pig iron in the first half of this year as compared with the last half of last year, except Ohio, whose production in the last six months was the highest attained in the history of the State in a similar period of time. The production of pig iron by the nine Southern States of Alabama, Tennessee, Virginia, West Virginia, Kentucky, Georgia, Maryland, Texas and North Carolina in the first half of 1888 was 433,796 gross tons, against 432,330 gross tons in the last half of 1887.

Our production of pig iron in the first half of 1888 was divided among the fuels used as follows, in comparison with similar details for the last half of 1887;

	Last half of 1887.	First half of 1888.
Fuel used—gross tons.....	2,071,693	1,885,539
Bituminous.....	868,929	789,874
Mixed anthracite and coke.....	146,201	96,252
Anthracite alone.....	281,030	248,427
Charcoal.....		

Total..... 3,367,853 3,020,092

The very small quantity of pig iron which is now made in this country with anthracite coal unmixed with any other fuel is a remarkable fact. As late as 1871 we made more pig iron with anthracite coal than with all other fuels combined.

The stocks of pig iron which were unsold in the hands of manufacturers or their agents on the 30th of June last, and which were not intended for the consumption of the manufacturers, amounted to 358,273 gross tons, against 301,913 gross tons on the 31st of December last, an increase of 56,360 gross tons in six months.

BESSEMER STEEL INGOTS AND RAILS.

The production of Bessemer steel ingots in the United States in the first half of 1888, including 36,070 net tons of Clapp-Griffiths ingots, was 1,384,288 net tons, or 1,235,971 gross tons, against 1,650,785 net tons, or 1,473,915 gross tons, in the last half of 1887, a decrease of 237,944 gross tons.

The production of Bessemer steel rails in the first half of 1888 was 775,261 net tons, or 692,197 gross tons, against 1,146,117 net tons, or 1,023,320 gross tons in the last half of 1887, showing a decrease of 331,123 gross tons. These figures do not include a few thousand tons of Bessemer steel rails rolled in each period in iron rolling mills from purchased blooms. The production of Bessemer steel rails in the first half of 1888 was reduced much more than that of ingots, indicating an increased use of Bessemer steel thus far this year for miscellaneous purposes of nearly 100,000 gross tons over the last half of 1887.

The Cost of Rolling Wire Rods.

In response to a number of inquiries we present below the figures given in an affidavit made by William M. Douglass, who was for four and a half years superintendent of the steel mill of the Gautier Steel Company, Limited, and the Gautier steel department of the Cambria Iron Company, at Johnstown, and for two years superintendent of the Hartman Steel Company, Limited, at Beaver Falls, having charge of wire-rod mills of various kinds during that time. The statement of the cost of manufacture of 1 ton of 2240 pounds of No. 6 wire rods attached to this affidavit is based on actual wage rates and costs two years ago, except the price of billets, which is the present rate. The number of hands named is that of one turn and covers all labor required to place billets aboard the car and deliver rods on the car and to handle all scrap and other waste:

Cost No. 6 Wire Rods (Per Ton 2240 Pounds).	
Labor (other sheet).....	\$3.109
Fuel (gas).....	.550
Repairs.....	.800
Rolls, turning, &c.....	.350
Oil, waste and supplies.....	.400
Stock, 2540 pounds, at \$28.50.....	\$30.28
Scale, 100 pounds, at —.....	.00
Scrap, 40 pounds, at \$17.....	.30
	29.980

General expenses.....	\$0.250
Superintendent.....	.120
Royalty.....	.100
Interest.....	.250
Other expenses.....	.100

36.009

Wages Rod Mill.

1 weighmaster.....	.045
1 Shearsman.....	.045
3 laborers, at .032.....	.096
each.....	.096
3 laborers, at .0266.....	.080
each.....	.080

It is fair to state, however, in connection with these figures, that Mr. George

T. Oliver, during the hearing, announced that the chairman of the Hartman Steel Company, then present, authorized him to say that the figures given are not correct, and that he would furnish the committee with the actual figures of cost of manufacturing by that company. Mr. William R. Stirling, treasurer of the Joliet Steel Company, made the point that the relation of duty to the cost of labor in finishing is deceptive. We not only require protection to cover the increased cost of labor in this country, as compared with the cost of labor abroad, but we also desire protection to cover the increased cost of supplies, coal and a good many other items entering into it.

The Modifications in the Wages Scale.

In the scales formulated in convention by the Amalgamated Association were a number of conditions and extras not contained in the scales that expired on June 30 last. Failing to agree in conference—in fact, failing to consider any portion of the proposition submitted to the manufacturers' Conference Committee—the first actual consideration of the proposition submitted by the Amalgamated Association was had with Mr. D. B. Oliver, of and for the firm of Oliver Bros. & Phillips, in the general office of the Amalgamated Association, after failing to agree in the general conference. At the Oliver conference, after nearly 12 hours' discussion, certain concessions were granted on the part of the Amalgamated Association committee. These concessions were of course granted to all who previously and subsequently signed the scale. The next modification obtained was by Jones & Laughlins, which has also been granted to all other firms. These changes were made prior to the printing of the scales in book form, and were as follows:

The roll turners' scale was stricken out entirely. In the memorandum of agreement the following was also stricken out:

"4. That for all crop ends on finishing mills used for merchantable purposes the same shall be paid for."

In the boilers' scale the last clause was eliminated—namely:

"10. One dollar per ton extra for boiling in furnaces where four puddlers and their helpers work on the same standing."

In the guide mill scale, under the head of "angles," the following changes were made: $1\frac{1}{4}$ by $\frac{3}{4}$, from \$4.10 to \$3.20; $1\frac{1}{2}$ by $\frac{3}{4}$, from \$4.10 to \$3.65.

It was also discovered that the figures \$2.03, that should have appeared opposite the $2\frac{1}{2}$ card rate in the scale for scrap-ping and busheling, had been omitted.

As above intimated, these concessions, changes and errors were allowed, made and corrected prior to the printing of the scales in book form. The scales were then gotten out and distributed to sub-lodges.

Since then (last Monday) the following has been granted on the hoop mill scale—note No. 9 on page 14:

"9. All hoops $\frac{1}{4}$, $\frac{1}{2}$, $\frac{3}{4}$, $1\frac{1}{4}$, $1\frac{1}{2}$ and $1\frac{3}{4}$ inch lighter than No. 22, 10 per cent. extra on above prices."

This last concession (an addition to last year's scale) will also apply to all mills making such product.

The citizens of Dunbar, Fayette County, Pa., have formed an association, entitled the Dunbar Improvement Association, and have issued a small pamphlet reviewing the history of that well-known iron manufacturing town, and calling attention to its special advantages, among which are proximity to the famous Connellsville coke district and the local iron ore deposits, the supply of natural gas, glass sand, fire-clay and other raw materials.

A Farewell to Midvale.

During the past month Mr. R. W. Davenport, who has been connected with the Midvale Steel Company for 14 years, resigned his position as manager to accept the charge of the Bethlehem gun foundry, now building. The occasion was seized by the employees of the Midvale Steel Company to express to their chief their appreciation of his work and their kindly feelings by presenting him with a gold watch and a gold chain, a miniature of the first all-steel gun made in the United States. The presentation speech was appropriately made by J. K. Griffith, superintendent of the melting department.

Mr. Davenport in his reply reviewed the history of the struggles of the Midvale Company to attain the recognized position it now occupies. He said:

It was 14 years ago last May, in 1874, that I came into the laboratory at Midvale, a rather fresh and green looking young man, I fancy, as some of you may remember. The works had just then passed through a crisis which had come near being fatal, and life was being brought back under the direction of Mr. Middleton, as superintendent, and Mr. Brinley, as his assistant in charge of the laboratory and the steel making. The works had been brought into this low condition by the grossest carelessness, if not ignorance, in the direction of the details of manufacture. Good and willing men were not lacking, the bone and sinew had been there, practical skill in melting, heating and working steel had been there, and there had only been needed, to make the enterprise a success, a more accurate chemical knowledge of the difference between good and bad steel and a common sense and conscientious application of it in the direction of the work. These requirements were well filled by Mr. Middleton and Mr. Brinley, and they took hold of the work in such a way as to make every true man trust and respect them. It was no easy task; the reputation of the works for producing good material was absolutely gone. Something like 3000 tons of steel of various kinds and in various conditions of manufacture were piled about the yard regarding which little or nothing was known. The only stock record book in existence was in the brain of old Miky Kelley, and to him Mr. Brinley would go for information, such as it was. The question of assorting this mass of material and determining its usefulness had to be solved by the laboratory, and it was to help in this work that I came to the works. By careful selection and mixing with high grade pig irons, purchased for the purpose, all this old stuff was successfully worked into rail blooms for which we got over \$100 per ton (the present selling price of rails is below \$30). This contract for rail blooms was with the Reading Road, and had been nearly cancelled on account of the former management of the works trying to use old ingot molds in making the steel, and thereby putting in so much phosphorus as to cause the rails to break in unloading. In the autumn of 1874 a very sad thing happened Mr. Middleton. Run down by overwork and anxiety, he was taken with typhoid fever, and after a most painful illness died in November. Mr. Brinley was now made superintendent, and I came from the laboratory to be his assistant. At this time there were less than 75 men employed at the works. One small open-hearth furnace was in operation; No. 1 hammer ran a few days a week; some tool steel was melted in the crucibles and hammered at old No. 3 hammer. Something had to be done to increase the product of the works. The Pennsylvania Railroad was then purchasing axles, rough turned all over, for its passenger service from England, and paying 13½ cents per pound for them. They were guaranteed to stand a very severe

test, and no one had made them in this country. The officials of the road scarcely cared to give us an order, but we finally took an order for 100 axles and went to work. Pete McAnally will remember how carefully we considered the subject and analyzed a piece of an English axle; how many trial heats we melted, and how anxiously we watched the result of the drop test, shivering in the cold those winter days. Finally we succeeded, and have since made many thousand of these axles for the Pennsylvania Road, and have been selling them for several years past for about 4½ cents per pound, which speaks well, I think, for the ability of our English cousins to charge a big price when they think they can get it, and for the effect of home competition in reducing price notwithstanding a protective tariff.

We next turned our attention to tires. As already said, the tin mill had been shut down; the tires had become so bad that they could not be sold. We believed that a first-rate tire could be made in the open-hearth furnace and went to work to do it. P. Conner will remember the first open-hearth tire ingot made in this country and sent to the forge to be punched and beaked. He looked at it very suspiciously, but it did not bite him and it did hammer very well. The manufacture of open-hearth tires soon ceased to be an experiment, and the works have since sold over 125,000 of them. In the meanwhile additional hammers and rolls were put in and the production of miscellaneous forgings, tool and spring steel, &c., constantly increased. Then came the first call from the Navy and Army for steel for built-up guns. We grappled with the subject with great doubts of our success; the tests demanded were very severe and our facilities very limited, but Mr. Brinley's careful, scientific mind directed our first efforts and we obtained promising results from the start. The development of this work has, I think, been a great advantage to the works and most instructive to all concerned. Up to the present date no other works in the country has supplied the Government with any large amounts of ordnance material. And now I have referred to a few things which we have accomplished at Midvale during all these pleasant years of work. We might have done more, but I don't think that we need be ashamed of our record; but, my friends, the fact that gives me more pleasure and satisfaction than any I have mentioned to you is that during all these 14 years, first under the direction of Mr. Brinley and then, since 1882, under my direction, we have never had a serious disagreement and work has never been stopped by a strike. And what has been the cause of this most desirable condition of affairs? It is, I think, chiefly because we have been able to trust one another. You have been led by comparatively young men, who have brought from the schools knowledge learned from books and the laboratory. They have come among you (and I do not speak now of myself alone, but also of the corps of able assistants with whom I have had the pleasure of working), not with an overbearing importance of the theoretical knowledge they had acquired, but with a high appreciation of the practical knowledge and skill acquired by you in years of hard work and with a desire to learn from you and give what they could in exchange. They have tried, I think, not to take undue advantage of the power accompanying their position, and not to make promises that they could not carry out. They have endeavored to know you personally; to meet you as man to man; to make you trust them, and their efforts have not failed.

The Director of Public Works, in Philadelphia, has awarded contracts for a gas-holder tank to Erskine D. Smith for

\$59,420.70; gas-holder to Morris, Tasker & Co. for \$46,820, and a 14-foot station meter to Helme & McIlhenny for \$4500. Contracts for iron pipe were awarded to the Donaldson Iron Company at the Gloucester and Camden Iron Works, and for pig lead to James C. Burton.

Test of Fireproof Wire Lathing.

A special train from Broad street station, last Wednesday, took out to Germantown Junction a large number of architects, builders, insurance men, and parties connected with the iron and steel trade, to witness a comparative test of the durability under fire of the ordinary wooden lathing, now generally used, and the fireproof patent stiffened wire lathing of the New Jersey Wire Cloth Company. A substantial two-story brick structure, about 8 by 12 feet in size, had been erected, with a stout dividing wall in the center, making two compartments. One apartment had its ceiling of wooden laths, nailed to joists and plastered over, and the other of wire cloth, upon which the plaster had been spread. A hot fire was built in each compartment after everybody interested had an opportunity to inspect the preparations by going up a ladder to the top of the structure, upon which no roof had been placed, the better to subsequently compare results. At the end of ten minutes, when the fire was extinguished, the wooden lathing had burned away, the plaster had fallen into the ashes beneath, and the joists became charred from the flames. In the other compartment, where the wire cloth was used, it and the plaster remained intact at the end of that time, as it did over an hour afterward, when the fire there had been allowed to burn out. The test seemed to meet the general approval of the spectators, who commended the use of the wire lathing in buildings intended to be fireproof, or, at least, slow burning.

Pittsburgh Pig Lead Freight.—The Pittsburgh and Lake Erie Railroad and its connections have made the following rates on pig lead in carloads, 24,000 pounds and over from Pittsburgh to the following named points: Rochester, 10½; Syracuse, 11½; Utica, 11½; Albany, 13½; New York, 13½; Boston, 18; Portland, 22½. The new rates went into effect on Wednesday the 25th ult.

The Detroit Dry Dock Company, of Detroit, Mich., have just commenced the construction of four large steamships, to be completed for next season's business. Two will be duplicates of the J. Emory Owen, and will be built of wood. The others will be composite, having iron frames and plating above water and plank below, similar to the Fayette Brown, but larger. The composite part will be 296 feet long, and will be built at the Wyandotte yard.

The Southern Railway and Steamship Association have issued a rate-sheet on pig iron, which went into effect on the 1st ult., making the rate to Cincinnati \$2.75 from Birmingham, \$2.25 from Chattanooga and \$2.50 from Sheffield and Florence, Ala., while the rates to Louisville are \$2.50 from Birmingham and \$2.25 from Chattanooga, Florence and Sheffield.

Contracts for furnishing steel for the armored battle ship Texas, to be built at Norfolk, Va., have been awarded as follows: Park Brothers & Co., of Pittsburgh, 920 tons of steel plates, \$66,770; Carnegie, Phipps & Co., of Pittsburgh, 503 tons of steel shapes, \$43,266, and 100 tons of rivets, \$8601; and the Standard Steel Casting Company, of Thurlow, Pa., 120 tons of steel castings, \$41,664.

THE WEEK.

The immense docks of Montgomery, Champaign & Co., at Lakeside, Mich., were destroyed by fire, together with 1,500,000 feet of lumber; loss, \$175,000.

During the month of June there were exported from the port of New York 21,831 packages of American agricultural implements, the total value of which was \$398,188; 245 cases of firearms, valued at \$36,660; 492 cases of tacks, valued at \$3887; 4498 kegs, 1216 cases, 28 boxes and 70 packages of nails, valued in all at \$20,826; and 1508 cases of American made cutlery, worth \$30,386.

The aggregate of Government receipts from the sale of public lands was greater last year than ever before. The sales amounted to about \$11,000,000, compared to \$9,000,000 for the previous year and \$5,000,000 for each of two years preceding.

The improvement of New York harbor is spoken of in detail by Engineer McFarland, U. S. A., in his annual report. The project for the improvement of Gedney's Channel, he says, provides for dredging a channel 1000 feet wide and 30 feet deep at mean low water, from deep water below the Narrows, through the main ship channel and Gedney's Channel to deep water outside the bar. To maintain this channel will require either periodical dredging or a contraction of the entrance by the construction of a dike running across the shoals from the Coney Island side, with suitable protection for the head of Sandy Hook to prevent its being scoured away by the increased current. The estimated cost of obtaining the dredged channel is \$1,490,000, and the entire cost of the improvement, should the contraction work prove to be necessary, is estimated at between \$5,000,000 and \$6,000,000. The dredging done during the last fiscal year, Colonel McFarland says, has resulted in producing a channel of good navigable width across the bar 25 feet deep at mean low water, but, he adds, it resulted in no practical benefit to navigation, since no increase of depth was obtained on the shoals inside the bar. The work on the Gedney's Channel division will be completed within the contract time, but the main ship channel cannot possibly be cleared by December 1, 1888, at which date the contract expires. The amount needed outside of the present appropriation to widen these channels to 1000 feet and to deepen them to 30 feet is \$540,000. The speedy removal of Flood Rock is a necessity, and \$500,000 could be expended advantageously during the next fiscal year.

A correspondent at Pittsburgh refers to reports gathered from Knights of Labor prominent in the order, that the membership in that organization to-day does not exceed 150,000. In the Pittsburgh district, for example, the members have declined within the year from 11,500 to a trifle over 4000, and the famous district No. 49 of New York, has decreased from 81,000 to 10,000. Apathy, according to this authority, has caused the difference.

Three members of the firm of W. G. Price & Co., manufacturers of iron, lead and shot, of Pittsburgh, are seeking a new site somewhere near McKeesport. The firm desires to rebuild its works and the shot tower so as to double the capacity and employ not less than 100 men at the start, but cannot do it on the old location, as it is hemmed in by other works.

The American Paper Makers' Convention at Saratoga last week elected E. C. Rogers, of Holyoke, Mass., president for the coming year. It was stated by the retiring president, Byron Weston, that profits during the past year were less than

ever before. Warner Miller opposed putting alum on the free list. One of the reports stated that 300 tons of manila paper are made daily. They had tried during the year to restrict the business, but failed. Over 12,000,000 pounds of wood board had been made last year.

The Suburban Elevated Railroad is advancing along the upper part of Third avenue at the rate of 200 feet a day.

In a recent speech Mr. Vest, of Missouri, said: "The railroads have abolished river navigation, just as much as civilization has abolished the Indians as an autonomy in this country. The poor, straggling steamboat men who I see around this capitol now remind me of the last remnants of an extinct race, the melancholy historical remains of a former era. It is inevitable, and you cannot help it. * * * The old-time glory of the steamboat has gone like that of Tecumseh and the great Indian chiefs, never more to be seen in this country."

Four anarchist dynamiters have been indicted by the grand jury in Chicago. Seric, the gunsmith, seems to have been an efficient co-worker in the manufacture of the deadly bomb.

The Guatemala Central Railroad, extending from San José, on the Pacific Coast, 71 miles in a northeasterly direction to the Capital, has become one of the most successful enterprises in which citizens of the United States have engaged in Central America. The total cost, including short branches, was \$2,500,000, and the net earnings in 1887 were \$211,606. The rolling stock comprises nine locomotives from the United States.

Jay O. Moss has been elected president of the Hocking Coal and Iron Board, Ohio.

The Senate passed the Army Appropriation bill, including the Hawley amendment appropriating \$750,000 for a gun factory at Watervliet, N. Y., \$5,000,000 for the purchase of steel for heavy ordnance guns, \$500,000 for the purchase of submarine mines and \$100,000 for submarine controllable torpedoes. The Fortifications bill, as completed by the House Committee, provides for an ultimate expenditure of \$15,000,000, of which \$6,200,000 is to be appropriated this year. A board of army officers and civilians is authorized to be appointed by the President to contract with gun-makers for the supply of 12, 14 and 16 inch steel rifles, not less than 50 in number, and at an expenditure not exceeding \$2,500,000 annually. The bill also provides for the purchase of 50 cast-iron mortars and 20 12-inch iron rifles.

Traffic arrangements for the use of the Poughkeepsie Bridge have been completed with nearly all the railroads, preparatory to the opening for business, a few days hence.

There are 51 cases for violation of the Contract Labor law in Massachusetts on file at the District Attorney's office, all of which will come up for trial at the October Term of the United States Circuit Court. Of these about 40 are against the owners of fishing schooners, who hired men in Nova Scotia and brought them to sail from Gloucester and other fishing ports. The others are all against farmers, who hired help in the provinces and brought them to Massachusetts to perform agricultural labor. There are no cases pending against the factories.

The spread of New York City in the direction of Westchester County, across the Harlem River, is uninterrupted. The Suburban Elevated Road will be in operation to Fordham next winter, a distance of nearly 5 miles from the Harlem at Second avenue. The New York and Northern Railroad runs through the west side of the district to Yonkers and will open

stations for way traffic as fast as needed. Perhaps the greatest improvement in the district is the sinking of the tracks of the Harlem Railroad, now nearly half done. The Manhattan Bridge, over the Harlem River, is now being finished. When the Harlem road has sunk its tracks a tunnel is to be built in place of the present railroad bridge. Another tunnel under the river at McComb's Dam Bridge for general traffic will be commenced soon. With the completion of the Harlem River Canal in the next two years most of these improvements will be finished.

A feature in the Congressional inquiry into the subject of immigration, now being prosecuted in this city, is the testimony of Alexander Monaco, the Italian Vice Consul. A large proportion of the Italian immigrants, he said, were farmers or farm laborers, but they were generally without the means to get further than New York. Contractors and others send to their friends in Italy and tell them to send over men and pay their passage, which was \$24 each. The immigrants are sent to certain people in this city, who place them at work, generally at from \$1 to \$1.25 a day. They are then required to pay back to their employers on this side the price of their passage and a liberal interest therefor. The amount the immigrants have to pay is sometimes as high as \$50, and the advance on the ticket is never less than \$5. Sometimes the bosses or contractors default after receiving the emigrants' wages, and leave them in the lurch. The contractors also act as ticket agents of the steamship companies.

Mayor Hewitt wants the Senate Aqueduct Committee to proceed with its investigation, as the new commission will be called upon to decide questions affecting not only the construction of the work but the compensation to be paid to the contractors.

Capt. John Ericsson entered upon his 86th year on Tuesday, July 31.

The contract for the great Soo water-power canal at Sault Ste. Marie, was awarded to MacArthur Bros., of Chicago, for about \$250,000. Work will commence August 1, when 1000 men will be put on the immense undertaking. The canal will be three miles long, with a capacity of 800,000 horse-power. This, it is believed by the promoters, will make the Soo the great milling center of the Northwest.

Bids for ironwork on the new public building in Brooklyn were opened in Washington on Monday. Among them were J. H. O'Rourke, \$230,000; E. F. Gable, \$149,388; K. A. Murphy, \$250,000; E. P. Wright & Co., \$229,662.

Lieut.-Col. W. E. Merrill, in charge of the Ohio River improvements, recommends that the plans in successful operation at the Doris Island dam, below Pittsburgh, be applied on a more extended scale, and he proposes two or more movable dams to cost \$1,000,000.

Consul-General Raine, at Berlin, says that in his opinion it would be highly advantageous for American manufacturers and exporters to combine and open a permanent exhibition of American specialties at Berlin. He believes that this would influence many important trade connections, for the reason that the influx of foreign visitors at Berlin is attracting thousands of people. Only the best of our industrial products should be exhibited. As a condition precedent the ground should be carefully gone over by persons having at least a fair degree of familiarity with foreign languages and knowledge of the wants and customs of prospective purchasers. As an example of what may be done by making foreigners acquainted with our goods, a case may be cited in which inquiries were received by cable

from Japan for the purchase of paper making machinery in England. Fortunately the dispatch fell into the hands of a gentleman who knew the superiority of the American plant, and the result was that the Japanese delegation came to the United States instead of going to England, and determined to purchase two complete plants for paper making, together with the necessary power, the order reaching in all the sum of \$250,000.

One of the works of greatest magnitude at present under way at the Brooklyn Navy Yard is the digging of the new dry-dock, contracted for by J. E. Simpson & Co., of New York. Some idea may be formed of the immense amount of timber required for its construction from the statement that it will take about 3,000,000 feet—or, in other words, equal to that contained in the wonderful timber raft coming here from Joggins, Nova Scotia, to complete the work.

In France, a new cruiser, known as the *Cecille*, has recently been launched, which is to be armed with six 5-ton and ten 3-ton guns, and is expected to make between 19 and 20 knots. This is one of 15 vessels of this class to be built there. Russia has planned three of a similar class, of which one will soon be afloat, and England recently launched one of five recently ordered. The five American cruisers now building will rank about the same as to size and speed.

There are invested in Michigan in saw mills and other machinery in the lumber business \$40,000,000, employing 28,000 men.

Fruit growers in California fear they will be unable to gather their crops this year, on account of the scarcity of labor since Chinese restriction has been enforced.

P. T. Barnum celebrated his 78th birthday by giving a building and lot to the Bridgeport Scientific Society at a cost of \$200,000.

Brazilian planters who lost their slaves through the emancipation bill are now clamorous for compensation. The Government idea had been to furnish money to the planters upon mortgage of the growing crops, and to supply this resource through a bank, but the Bank of Brazil demanded favors which the Government was unwilling to concede. The planters, however, are unanimous in the demand, not for temporary assistance, for which they would have to pay high interest, but for compensation for the property of which they were suddenly deprived.

With the lessened demand for iron, a possible shortage in the wheat crop and a largely increased tonnage seeking employment, the season of navigation on the lakes is not promising, and business at all the lake ports is much depressed.

There were five bidders for steel for use in construction of the United States armored battle ship *Texas*, to be built at Norfolk, the lowest being as follows: For 920 tons of steel plates, Park Brothers & Co., of Pittsburgh, \$73,983; for 503 tons steel shapes, Carnegie, Phipps & Co., of Pittsburgh, \$43,266; 100 tons of steel rivets, Carnegie, Phipps & Co., \$8602; 120 tons of steel castings, no bidders.

A new steam canal boat, the *World*, built by G. W. Hall, of Lockport, N. Y., is 96 feet in length, with a single-screw propeller and consumes $1\frac{1}{2}$ tons of coal per day. She easily made her first trip with a load from Buffalo to New York in six days. She cost \$7000.

The harbor of Yokohama is to be improved at a cost of \$1,700,000.

A contract for the building of the new paint shop of the Pennsylvania Railroad

Company, in Altoona, Pa., has been awarded to Hoover & Hughes, of Phillipsburg. The contract price is \$137,000.

Z. Taylor & Co.'s iron foundry, in Brooklyn, was damaged by fire to the extent of \$8000.

The best record yet made by first-class steamers, the *Umbria* and *Etruria*, stands at six days and two hours. It is expected that the City of New York and City of Paris, will outdistance her achievements. She was tested in many ways, but she was only tried for speed at short intervals, and each time she sped through the water at the rate of 23 miles an hour.

An examination of the official time tables for June, made by the *Railroad Engineering Journal*, shows that the fastest trains now scheduled are two on the Baltimore and Ohio, which are timed to run the 40 miles from Baltimore to Washington in 45 minutes without stops, making the rate of speed $53\frac{3}{5}$ miles an hour. No other train can be found which makes over 40 miles an hour.

The salmon pack of the Columbia River this season will be about 300,000 cases, and will net about \$1,950,000.

Findlay, Ohio, in utilizing its gas supply, made arrangements by which the town furnished fuel gas to factories without any charge whatever. The result is that it built 2700 new houses last year.

The report of the Commissioner of Labor, Carroll D. Wright, upon the strikes and lockouts of the past six years, which has just been issued, gives some interesting statistics concerning labor troubles in the State of New York. Since 1881 there have been 9247 strikes ordered in the State, 8716 of them by labor organizations. These strikes involved 9247 establishments, 4717 of which were closed for an average period of 15 days. Of the total number of strikes 4720 succeeded, 753 partly succeeded and 3759 failed. The total loss to employees aggregated \$8,581,784, and that of employers \$5,966,421. The sum of \$726,696 was raised by labor organizations to aid the strikers. In these strikes 376,584 employees were involved, and the places of 24,889 strikers were taken by new employees, of whom 4581 were brought from other places. One thousand five hundred and twenty-eight lockouts were ordered in the same period, closing an equal number of establishments an average period of 22 days. Of these 180 only succeeded, 137 were partly successful and 1090 failed entirely. The loss to employees was \$3,150,123; to employers, \$845,262, and \$392,316 was raised to support the locked-out employees. Of the total number of strikes occurring during this period 3416 were owing to demands for increased wages, while 2997 were for a reduction in the hours of labor. Of this latter number 1752 occurred in the tobacco trade alone.

A statement from the United States Consul at Hamburg shows that the exports from that district during the year ended June 30 amounted to \$5,936,535, which is a decrease of \$208,612 compared with the previous year. Metal, metal goods and hardware were included to the amount of \$61,545; zinc and spelter, \$13,610.

The Secretary of the Treasury recently submitted to the Attorney-General for an opinion the question whether the term "forgings of iron and steel," as used in the tariff act in the provision for "forgings of iron and steel for vessels, steam engines and locomotives, or parts thereof, weighing each 25 pounds or more," covers only forgings of the two metals combined, or both forgings of iron and forgings of steel. The Attorney-General gave it as his opinion that the term applied to both forgings of iron and forgings of steel, and

not alone to those forgings in which the two metals are combined. The Treasury Department has accepted this interpretation, and customs officers have been instructed accordingly.

The substitution of Belgian blocks for cobble stone in the streets of Philadelphia is the subject of a special message from the Mayor, who has come to an agreement with the street-car companies regarding co-operation in the work, the basis, it is said, being that the city shall pay \$1.50 per square yard of Belgian block and the companies about \$1. It is estimated that a mile of a Philadelphia street of ordinary width can be paved with granite blocks for \$40,000. On this estimate 17 miles of streets could be paved with the \$300,000.

Contractors in Ottawa, Ontario, say the Government will shortly call for tenders for the construction of the Sault Ste. Marie Canal, but they doubt whether the contract will ever be awarded, as they think the proposal is only a scheme to frighten the United States in the event of an unsatisfactory settlement of the fishery question.

An oil shipping firm at Pittsburgh have entered suit against the Pennsylvania Railroad Company to recover \$150,000 damages under the Interstate commerce law, on account of a rebate of 13 cents per barrel allowed a competitor, the firm referred to having been discriminated against to this extent on more than 260,000 barrels, besides suffering in other respects.

Four tea laden steamers running in connection with the Canadian Pacific Railway Line will deliver their cargoes at Vancouver this season. Of two cargoes that have already arrived the first consigned to New York, reached this city in 12 days from the Pacific Coast.

According to Congressman Dingley, of Maine, who has collected a vast amount of statistics relative to the paper interest of this country, especially his own State, wood, pulp and fiber is a product of no less than 21 States out of the 38. The capital employed in its manufacture amounts to \$25,000,000, the number of men employed in the mills being over 22,000.

Total immigration to the United States, save from Canada and Mexico, for the month of June was 68,475. For the same period in 1887 it was 65,884. Immigration for the year ended June 30, 1888, was 539,818, against 483,116 the previous year.

A new boycotting question has been decided by the Massachusetts Supreme Court. The *Lasters' Protective Union* caused several men carrying placards to walk up and down in front of a shop in which the employees were on a strike. The placards were intended to keep new men from taking the places of the strikers. The employers did not proceed against the offenders criminally or sue for damages, but appealed for an injunction to stop the placard business. The Supreme Court rules that it was a proper case for an injunction. It holds that the thing complained of was a nuisance detrimental to the interests of the employers, and, as such, one that ought to be abated by the court.

The Leary log raft, which is about to be towed from Nova Scotia to New York city, will cost, if successfully landed, as follows: The timbers cost, in Nova Scotia, \$13,000; the logs can be sold in New York for \$50,000. The timbers of the ship, if sawed on the Bay of Fundy, would require a fleet of 100 schooners to transport them to New York, or it would take 50 trains of 50 cars each to transport the lumber the same distance. There seems to be no doubt in the minds of tow-boat people in this city that the work of handling the raft will be successful.

MANUFACTURING.

Iron and Steel.

P. L. Kimberly & Co., Limited, proprietors of the Atlantic Iron Works, at Sharon, Pa., have signed the Amalgamated scale and operations were resumed in full on Wednesday, the 25th ult. On account of the retirement from the firm of Edward Roberts, William B. Roberts becomes general superintendent, L. A. Burrel assistant superintendent and R. D. Brown boss of the puddling department.

The Standard Iron Company, of Bridgeport, Ohio, have signed the scale and resumed operations. During the shut-down the firm made some very extensive improvements and additions to their plant, and in a few weeks the capacity for sheet iron will be almost doubled. They have built an addition 100 x 60 feet, in which are located two new sheet mills, built expressly for this company from plans furnished by Manager T. B. May. One is a specially heavy jobbing mill and the other is a mill built expressly to roll very thin sheets, to be used in the galvanizing mill. They have also built a galvanizing shop, with a capacity of 20 tons daily, and a plant in which coal gas can be made to supply the entire mill. This move is made necessary by the Wheeling Natural Gas Company refusing them gas at the old rate.

Cartwright, McCurdy & Co., operating the Enterprise Rolling Mill, at Youngstown, Ohio, and the Youngstown Rolling Mill Company, at the same place, have signed the Amalgamated scale and resumed work. The following note was eliminated from the agreement: "All hoops, $\frac{1}{4}$, $\frac{1}{2}$, $\frac{3}{4}$, $1\frac{1}{4}$, $1\frac{1}{2}$, $1\frac{3}{4}$ and 2 inch lighter than No. 22, 10 per cent. extra on above prices." This refers to the lightning-rod scale, and especially to these two mills. The same rule will be stricken off when Lindsay & McCutcheon and J. Painter & Sons, both of Pittsburgh, sign the scale.

The night turn in the converting mill of the Edgar Thomson Steel Works, at Braddock, Pa., on the evening of the 23d ult. made the largest output ever made in the same time since the works were built. Sixty-three heats were made, producing over 600 tons of steel. The run is said to never have been excelled by any steel firm in the country under similar conditions.

The Columbia Iron and Steel Company, of Uniontown, Pa., have signed the scale, and their plant is now being operated to its utmost capacity. The firm are manufacturers of steel structural shapes exclusively, and have sufficient orders on hand to keep them busy for the balance of the year.

On Thursday, the 23d ult., the Warren Rolling Mill, at Warren, Ohio, signed the Amalgamated scale, and operations were resumed in all departments on Monday, the 30th ult. Except for a few weeks last year this mill has been idle since 1883. Last year Alderdice, Bishop & Co. expended more than \$100,000 in repairing the plant, and, after a short run, failed. The creditors then secured Henry Wick to operate the mill for them, and \$20,000 more has been put in, making what iron men claim to be the best mill in the Mahoning or Shenango valleys. A patent process of heating the iron that discounts natural gas for cheapness has been attached to the building furnaces, and it is expected that, for the first time in the history of the mill, iron will be made with profit to the owners.

James P. Witherow, engineer and contractor, of Pittsburgh, has just closed a contract with the Chester Rolling Mills, of Thurlow, Pa., for the erection of a new Bessemer steel plant, to be run in connection with their rolling mill. They will operate two 3-ton vessels with blooming mills complete. These will have an output of 350 tons per day and will give employment to 400 men.

A. M. Byers & Co., of Pittsburgh, signed the scale last week, and their plant is now in full operation.

The Hartman Steel Company, Limited, of Beaver Falls, Pa., are placing several sets of shears in their works and will soon commence to shear steel plow shapes. This is a new departure for this firm.

Norway Furnace, at Pottstown, Pa., operated under lease by Gabel, Jones & Gabel, was blown out last week. On Monday, the 23d ult., a portion of the tunnel head fell in, which could not be repaired without a stoppage. The Philadelphia Coal and Iron Company, who own this furnace, are repairing the old hot blast, and will put in an additional one. All the repairs and improvements can be made and the furnace be ready to resume operations in about two months.

The Buckeye charcoal furnace, at River-ton, Jackson County, Ohio, has been sold to F. E. Hinkley, of Chicago, Ill.

The bulk of the contracts for furnishing steel for the battleship Texas, to be built at Norfolk, Va., awarded at Washington, D. C., on Wednesday, the 25th ult., has been given to Pittsburgh concerns. The following awards have been made: Park, Bro. & Co., Limited, 920 tons of steel plates, \$66,700; Carnegie, Phipps & Co., Limited, 503 tons of steel shapes, \$43,226, and 100 tons of rivets, \$8601. The Standard Steel Casting Company, of Thurlow, Pa., were awarded the contract for 120 tons of steel castings, for \$41,664.

The Cambria Iron Company, of Johnstown, Pa., are rebuilding their Conemaugh Furnace.

No. 2 stack of the Appleton Furnace Company, at Appleton, Wis., has been taken down, and it will not be rebuilt.

The Moorhead-McCleane Company, proprietors of the Soho Iron and Steel Works, of Pittsburgh, signed the Amalgamated scale last week, and operations were resumed in full on Monday, the 30th ultimo. The demand for a 10 per cent. reduction, which affected the Knights of Labor in the employ of the company, has been withdrawn.

Lucy Furnace, No. 1, of Carnegie, Phipps & Co., Limited, at Pittsburgh, will be blown out some time during the present month, for the purpose of being repaired. This furnace has produced over 150,000 tons of iron on the present lining, which is certainly a remarkable record.

Carnegie, Phipps & Co., at their lower Union Mills, Twenty-Ninth street, Pittsburgh, have completed a large iron building over the department where much of their shape iron is shipped. It affords great protection to the workmen and also gives plenty of room for the handling of a traveling crane.

Ella Furnace, of the Wheeler Furnace Company, at West Middlesex, Pa., has been blown out for the purpose of being relined and repaired. An improved hot blast is being erected, and a new 87-inch cylinder upright blowing engine will be placed in position, and take the place of the present engines.

The Etna charcoal furnace, at Etna, Polk County, Ga., which has been idle for over two years, is now being repaired, and is expected to be put in blast in October.

A special dispatch from Lebanon, Pa., under date of the 26th ult., reads as follows: "An application is to be made for

a charter of an intended corporation to be called the Lebanon Rolling Mills, the character and object to be the manufacture of iron or steel. The new corporation will absorb Light's Rolling Mill, and erect additional mills with improved facilities for the production of iron and steel."

A recent issue of the Sharpville (Pa.) *Advertiser* says: "In 1870 Sharpville had three blast-furnace plants, producing 4500 tons of pig iron per month, or 54,000 tons per year. This represented approximately about 250,000 tons of freight per year. At the present time there are six plants, producing, say, 16,000 tons of pig iron per month, or nearly 200,000 tons per year, representing 1,000,000 or more tons in freight. The materials come principally from Michigan, Minnesota, Wisconsin, Ohio and Western Pennsylvania and other States. Sharpville has increased in population from 800 in 1870 to nearly 3000 at the present time."

The Bellaire Nail Works, of Bellaire, Ohio, signed the steel scale last week, and will resume operations in the Bessemer department in a few days, repairs having been about completed.

The Trumbull Iron Company, of Girard, Ohio, signed the Amalgamated scale on Tuesday, the 23d ult., and the works of the company are now in full operation.

The Mahoning Valley Iron Company, of Youngstown, Ohio, signed the scale on Wednesday, the 24th ult., and operation were resumed in all departments the next day. The firm employs about 1200 men.

The Hartman Steel Company, Limited, of Beaver Falls, Pa., are averaging a product of over 100 tons of wire rods a day.

On Saturday, the 28th ult., Andrews Brothers & Co., proprietors of the Haselton Iron Works, at Haselton, Ohio, signed the Amalgamated scale. The puddling department has already resumed operations and the finishing departments will be started up as soon as repairs are completed. This leaves but one firm in the Mahoning Valley that has not signed—the Hubbard Iron Company, of Hubbard—and it is understood it will sign as soon as the machinery is in shape.

At the works of the Cleveland Rolling Mill Company, of Cleveland, Ohio, the Bessemer steel works, new steel works, big and small hammer works, old and new blooming mills, the three rod mills, rail, puddle and bar mills, foundry, blast furnace and the model shop, are all working full handed.

On Saturday, the 28th ult., the Pittsburgh Forge and Iron Company, of Pittsburgh, whose plant is located in Mahony City, Pa., signed the Amalgamated scale. Operations were resumed in all departments on the 30th ult.

The Missouri Furnace Company, of St. Louis, are completing repairs to Furnace No. 1. The same has been relined from top to bottom and only the smaller repairs remain to be finished.

At the annual meeting of the North Chicago Rolling Mill Company, held on the 25th ult., at the company's office, in the Rookery Building, Chicago, there were 54,644 shares of the stock represented out of 60,000 shares. The report for the year's business of the company, ending June 30, 1888, shows

Gross earnings of.....	\$13,549,486.64
Gross tons.....	1,000,139
Volume of product.....	1,304,235
Raw material received.....	347,795
Pig metal made.....	313,016
Steel ingots.....	263,772
Steel rails.....	630
Steel beams.....	74,926
Bar iron, nails and muck bar.....	

The following Board of Directors was elected: Nathaniel Thayer, of Boston;

Orrin W. Potter, Edward C. Potter, of Chicago. The officers elected for the ensuing year are as follows: Orrin W. Potter, president and treasurer; Edward C. Potter, vice-president; Richard C. Hannah, secretary; William H. Hannah, assistant secretary; John C. Parkes, general manager; Francis Hinton, manager at Milwaukee. The manufacture of steel beams, tees, angles, channels and plates and the erection of works for this purpose will be fully considered at an early day.

Machinery.

The Providence Steam Engine Company, of Providence, R. I., who are the sole builders of the improved Greene engine, are now engaged in the construction of engines from 50 to 700 horse-power for the United States Electric Lighting Company, two orders, American Baptist Publication Society, George V. Cresson, C. S. Garrett & Son, Wm. Gray & Son, Croft & Allen, Philadelphia; Victory Mfg. Company, Saratoga, N. Y.; Ramsey & Gore, Ashley & Baily, John Dunlop, two orders, George Frost & Son, two orders, Paterson, N. J.; Peel Brothers, Staffordville, Conn.; Horace Remington & Son, J. P. Campbell & Co., Providence; Congree Mfg. Company, Columbus, S. C.; Hammond, Hull & Co., Savannah, Ga.; P. P. Kellogg, Springfield, Mass.; Jamestown Worsted Mill, Jamestown, N. Y.; Henry Woods, Son & Co., Boston, Mass.

The syndicate that recently purchased the Howe Scale Company's plant, at Rutland, Vt., is composed of Edward Chaffee, John W. Cramton, Dr. John A. Mead and E. D. Keyes.

The Westinghouse Air Brake Company, of Pittsburgh, has practically absorbed the American Brake Company, of St. Louis. The American manufactures a steam driving-wheel brake for engines with reverse action to that of the Westinghouse, and railroads have already adopted it. The American Company also hold a patented improvement of the air brake to facilitate the exhaust of air and to hasten the departure of trains. Under the new arrangement the American Company will confine itself to the manufacture of steam brakes, the Westinghouse taking the improved air brake. The American is capitalized at \$2,000,000, on which the Westinghouse Company guarantees 5 per cent. On the \$60,000 bonds issued by the American Company to secure working capital the Westinghouse Company guarantees 6 per cent.

The Leechburg Foundry and Machine Company, Limited, of Pittsburgh, whose works are located at Leechburg, Pa., are now about completing the placing of their new machinery. After being burned out, this company increased its capital stock from \$50,000 to \$75,000, and are placing the finest machinery that can be gotten.

F. N. Armour has been appointed manager of the C. & C. Electric Motor Company's Western office, which is located in room 6 of the Adams Express Building, Chicago. The main office of the company is at 88, 90 and 92 South Fifth avenue, New York. They manufacture electric motors from one-eighth horse-power up for general manufacturing and mechanical purposes, also the C. & C. portable battery motor. The establishment of the Chicago office has been the means of introducing these motors more extensively in the West, where they have been found to meet a hitherto unsupplied demand for a cheap engine.

The U. S. Rocking Grate Bar Company have removed their office from 154 Lake street to 187 Dearborn street, Chicago. Samuel S. Chisholm is now secretary and manager. He has recently issued new price lists and descriptive circulars. The list of establishments into which this grate

has been introduced is very large and constantly growing. The construction of the grate is such as to secure a differential movement when the lever is worked back and forth, some bars moving through the arc of a larger circle than the others. It is claimed that this movement drops the ashes, clinkers and cinders from the under surface of the fire without disturbing the burning mass and dropping any unconsumed coal. Cast-iron saddles are set on the bars, and they alone come in contact with the fire. When burned, they are easily removed and renewed.

Among those burned out by the destruction of the Pyreon Art Tile Works, at Sing Sing, on Sunday last, were Abram Kipp's brick-making machine shop; loss, \$85,000, and Hiram Rickey, manufacturer of patent baking pans.

Edison's foundry, at Schenectady, was destroyed by fire on Saturday; loss, \$32,000. All the patterns were consumed.

The Grant Locomotive Works, at Paterson, N. J., are in full operation. A great deal of work is being done for the Erie Railroad, and this, with recent orders, will keep the present force of workmen busily employed for six months to come. The company contemplate the removal of their works to some point in the West not yet determined upon. Recently, in view of this purpose, the force of workmen was reduced, but heavy orders compelled the re-employment of as many of the old hands as could be secured. This temporary slackening of work was in some quarters misunderstood to mean that the works were to be closed. As a matter of fact, the company were never more prosperous than now, and nothing is more remote from their plans than a retirement from business. On the contrary, in their new field the company's operations will be extended with a plant that is intended to be the most complete in the country.

The Lewis Foundry and Machine Company, Limited, of Pittsburgh, last week shipped to Trinidad, Col., a considerable part of the new rolling mill to be erected there. The whole will be completed within four or five weeks. This firm had the contract for the entire plant, excepting foundations and building. They now have in hand another new mill, for Alabama.

Manning, Maxwell & Moore, 111 Liberty street, New York, have recently furnished to the Chicago, St. Paul, Minneapolis and Omaha the following tools made by the Pond Machine Tool Company, of Plainfield, N. J.: One 36 x 36 inch planer, with bed 10 feet long; one 18-inch and one 28-inch lathe; also one 13-inch Niles Tool Works slotter. The planer was placed in the St. Paul shops of the company, the 18-inch lathe in the Altoona, Wis., shops, and the slotter and 28-inch lathe were sent to the Sioux City shops.

The Union Stone Company, of Boston, Mass., write us as follows: "We have secured the business of J. W. Dennis, of Buffalo, and the inventions of Mr. F. A. Shoemaker, in center grinders, Universal Travers grinders, cutter grinders, and patent belt shifter, and have several new machines that will soon be ready for the market. Trade we find quite good for time of year—in fact, we are six weeks behind orders on emery-wheels and machines. Mr. F. A. Shoemaker is in our employ as salesman."

The Bed Rock Emery-Wheel Works, formerly of Bainbridge, N. Y., are now located at Gloucester, Mass., and are known as the Bed Rock Emery-Wheel Company.

Curtis & Curtis, of Bridgeport, Conn., manufacturers of the Forbes patent die stock, pipe cutting and threading machin-

ery for hand or power, have just moved into their extensive new works. Notwithstanding that they have now over three times their old capacity, they are already running overtime with all the men that they can run.

Within a year Messrs. William Tod & Co., of Youngstown, Ohio, have sold Porter-Hamilton engines aggregating about 3000 horse-power for wood-pulp grinding. Recent orders are for 500 horse-power from the Kokomo Wood Pulp Company, and 750 horse-power from the Westmoreland Paper Company. They are also building a 700 horse-power compound engine, with surface condenser, for the California Electric Light Company, of San Francisco.

Hardware.

West Lebanon Rolling Mill Company, Lebanon, Pa., are busy in all their departments and running full force. In the chain works they have several contracts with the United States Government for heavy cables for use in the navy. These aggregate over 100 tons.

The Lambert & Bishop Wire Fence Company, of Joliet, Ill., shut down their works on the 21st ult. for repairs and alterations. They will probably remain closed for three weeks. When they start up again a reduced scale of wages will be adopted. The low prices of wire have rendered the cut in wages necessary, in order to decrease the cost of production. The force of workmen were notified of the intended reduction in wages when the works were shut down, so that they might seek employment elsewhere if they concluded not to accept the terms proposed. A report has been circulated that the reduction was 33½ per cent., but this is incorrect, as in no case is such a heavy decrease contemplated. Care has been taken in the arrangement of the new schedule to enable every workman to earn good living wages.

The Wichita Wire Nail Company are building a brick factory, 40 x 300 feet, with a front projection 16 x 40 feet. The engine-room will be 30 x 40 feet, and one story high, the balance being two stories high with basement 137 feet long under one wing. The capacity of the works will be between 20 and 40 tons of nails per day, in the keg. The company will draw their own wire.

The Tuthill Spring Company, of Hammond, Ind., have long made springs for baby carriages. They have now made arrangements to add the manufacture of wheels and axles also, having bought the entire outfit of the Metallic Wheel Company, of Terre Haute, and the patent controlled by that company.

The strike in the barb department of the Freeman Wire Mill, East St. Louis, inaugurated six weeks ago on account of a reduction of wages, has been declared off, a compromise having been effected.

Miscellaneous.

The Pullman car shops, at Detroit, at the present time are employing over 700 men. The works are running almost to their full capacity, and have not been so rushed with new work for several years.

Rowell & Co.'s plow works, at Hartford, Wis., were burned on Saturday; loss, \$25,000.

The Fuel Gas and Electric Engineering Company, of Pittsburgh, have a contract to put in a fuel gas plant at Salem, Ohio. The city council has granted franchises to a local company capitalized at \$150,000 to operate the plant and furnish gas for heating, illuminating and power purposes. The plans are now being prepared and work will begin as soon as possible.

The Iron Age

New York, Thursday, August 2, 1888.

What is a Reasonable Rate?

The shipping public will take much interest in the case of the Granger railroads against the Iowa Railroad Commissioners, now proceeding. It will be remembered that the Iowa Commissioners promulgated a State tariff which the railroads would be forced to accept and put in use. The company officials found the rates named to be below any previous tariff and below what they considered cost of transportation and a fair profit. At first no way seemed open but to accept the situation. The very name commonly used to describe the railroads affected—Grangers—recalls the fact that in the struggle against the power of State governments to regulate railroads and their tariffs the farmers' granges won a complete victory and settled the question whether our transportation lines were or were not subject to State control. So the attorneys turned to the equity of the case and proposed to show that the rates as arbitrarily established by the Iowa Commission were not reasonable. To prove this they subjected the commissioners to a severe examination, with the result of showing that the proceedings of that body were irregular, and that the reasoning by which many of the changes were made was unsound. One of the commission, under pressure of close questioning, said a rate might be reasonable even though it did not pay operating expenses.

It has been a grievance of long standing with some of our prominent merchants, that while in rate-making there were two parties in interest, the carrier and the shipper, but one of these had the authority, the other generally not being consulted. It must be confessed that the grievance had a foundation in fact. The Iowa Commission, however, reverse this position, the railroads in this case being ignored. The latter case is further complicated by the fact that apparently the judges do not understand the principles of the matter upon which they attempt to pass judgment. It is evident that the solution of our transportation problem is not to come by our adhering to either of these extreme theories. When we examine closely into the matter and follow out our reasoning, we find that we are compelled in the end to choose between two principles: We must rely upon competition, or must have organized and competent regulation by Government. The former plan, which is the basis of the national Interstate law, discourages pooling and even association among railways, upon the assumption that the public will find its best protection by the same strife which we are accustomed to in mercantile affairs. The danger of this plan lies in the essential differences between running a store and operating a railroad, and in such an exaggerated competition as will defeat its own ends and de-

moralize commerce. On the other hand, the theory of exact regulation by Government involves grave questions. Would it be consistent with our form of government? Would it be possible to keep such a department out of the hands of politicians? Certainly the times are not yet ripe for such an experiment. Meanwhile, it must be said that such proceedings as those of the Iowa Commissioners only complicate matters. Undoubtedly there are charges against the Iowa railroads which are true, and items in the classifications and tariffs which should be altered, but the Iowa men, judging from reports of the case, do not seem competent to overturn everything and do it justly. Certainly we should not have Governmental regulation of railroads by any agency which has not knowledge and experience coupled with common sense.

Judge Brewer's decision complicates matters. He holds, in continuing the temporary injunction against the Iowa Commissioners from enforcing the schedule of rates recently adopted, that while legislatures have the right to delegate authority to make rates the latter must be "reasonable." The meaning of this term is declared to refer to rates which will enable a road to earn not only operating expenses, but also fixed charges, and something, however small, in the way of dividends. Only a day or two ago this position was reaffirmed in the Minnesota case.

It is on this very point that the difficulty hinges. We feel convinced that shippers and the public at large will not for any length of time withhold from investors a fair return on the capital actually expended in construction over and above the sums needed for maintenance and improvement. The trouble is that few are willing to take the word of railroad managers for the accuracy of the statements covering cost of building, equipment and terminals, and the possible losses incurred at different times. We are inclined to believe fair-minded men will go even further, and will admit that those who have put their money into railroad enterprises are entitled to compensation in the way of extra profits for the risks taken in embarking upon uncertain ventures. But the public knows that it is paying profits on an enormously inflated capital—that in the majority of cases the returns are made to appear very much smaller than they really are on the actual money invested. We doubt whether the agitation will cease until the conviction is reached that the water has been squeezed out of stocks and bonds, or at least has become ineffective as a pretext for excessive compensation.

In the meantime it is clear that there is as much danger to a good cause from unrestricted power of State and national commissioners governed by political motives only as there is in the abuse of power by railroad managers.

The policy of offering bounties to manufacturers to induce them to locate their shops in certain towns has worked well in numerous instances. Towns now noted for their enterprise and the extent and variety of their trade have first been brought into prominence by their liberality in this respect. There are many ways of paying such bounties, however, and to some of them serious objections have been found. One of the easiest

ways to raise a bounty is by levying a tax on all the citizens by vote of the town authorities. As all classes of property are presumed to be benefited by whatever conduces to the increased prosperity of the town, it would seem to be both reasonable and proper to make all contribute their share to such a commendable object. Small taxpayers do not usually object to this method of raising funds to "boom" the town, but the large taxpayers often protest against it, as they are obliged to bear the greatest part of the burden, which is apt, in their eyes, to obscure from view the larger benefits they will derive. Last week a case of this kind was brought up before a Michigan court for legal decision, some heavy taxpayers of Trenton, Wayne County, denying that the Village Board had authority to vote a bounty to a stove foundry now being erected there under this inducement. In itself this particular case is not of great importance, but if the courts decide against the legality of the tax it will affect many other towns in the State in which the same thing has been done to a greater extent. The taxpayers in those towns also protested at the time, but did not institute legal proceedings to ascertain their rights. They will probably not hesitate if the way is now open to them to demand restitution. Obviously, the safest way to raise a bounty is by voluntary subscriptions, rather than by taxation. The legality of such a method would never be questioned.

Discontented Iron Molders.

It seldom happens that labor organizations give employers much time to consider demands which are to be enforced by strikes if not conceded. The Iron Molders' Union of North America, recently in session at St. Louis, has made a notable departure in this direction. The members of that body have concluded to demand a reduction of their daily hours of employment to nine, and name April 1, 1889, as the date on which the proposed change shall go into effect. This gives the employers eight months' notice, which is certainly ample time for consideration and preparation, and will afford sufficient opportunities for the reconsideration and abandonment of the demand in case the molders themselves should become convinced by intervening circumstances that it would be inexpedient to press it. Their conservatism in this respect is worthy of imitation by other bodies of workmen. There are many reforms sought by those whose labor is their only commodity that might be accomplished through quiet discussion and prolonged agitation, which are wrecked by attempts to suddenly force them upon employers. It is true that strikes seldom occur until a conference has been sought and the demand has been made and refused. Instances are rare in which no discussion of a grievance or a proposed reform has been had before workmen lay down their tools. But the time devoted to such a discussion is too often very limited.

The reduction in hours of employment proposed by the Iron Molders' Union is a radical change which needs to be very thoroughly discussed by those directly interested before they attempt to compel employers to adopt it. The statement is

made that the members of the union themselves who were present at the St. Louis meeting were by no means united in support of the proposition. A strong opposition to it was developed, and it was carried by a bare majority. The conservative element evidently knew that many employers would resist to the bitterest extremity an attempt to establish a nine-hour day for molders, and that the enforcement of the demand merely meant a long period of idleness with probably no compensating benefit. They recognized the fact that in many works the molders constitute but a part of the employees, and that the molders' day could not be cut down to nine hours while the mechanics in other departments worked ten hours. Agricultural implement works, machine shops, engine works and similar establishments might be forced to adopt a uniform nine-hour day for all their departments if the molders were granted the proposed reduction. This would necessarily curtail production and increase cost, while the tendency in every branch of industry in late years has been to decrease cost as much as possible.

The partial success which workmen in the building trades have scored in various parts of the country, in establishing a shorter working day, has probably influenced the molders, who were instrumental in committing the union to the support of the demand for a nine-hour day. They reasoned that if carpenters and bricklayers, plasterers and hodcarriers, masons and roofers worked only eight hours a day, and their employers were gracefully accepting the situation, there was no reason why molders should work ten. In their opinion the reduction of but one hour asked for is a very reasonable demand, when the building trades have secured a reduction of two hours. If they had studied the matter further, however, they would have found that the eight-hour day is by no means general among the building trades of the country, that where it is most strictly enforced building operations are severely contracted as compared with previous seasons, and that the impression prevails among the best-informed mechanics that the eight-hour movement was a mistake, to be atoned for as long as the short day exists, and to be corrected before another building season opens if constant employment is desired. This is particularly apparent in the eight-hour cities of the West.

The iron founders of the country have further been advised by the union as to the plan of campaign. The statement is published that if the demand for a nine-hour day is not conceded strikes will be ordered in the smaller shops, and as rapidly as they yield the contest will be extended to the larger ones. It would be singular, indeed, with the plan thus outlined, if the larger founders would not make preparations to stand by their fellow-founders and precipitate a general engagement in which the full strength of the molders' organization would be tested. Of course there are many foundries in which this issue will not come up under any circumstances, the molders being paid by the piece and not by the day. As soon as their usual daily task is ended they quit work, whether they have been engaged for eight, nine or ten hours. The stove foundries and others making specialties come in this class. Their mold-

ers, however, would form a very strong element of support to the union in case the threatened strike should develop.

Judging from the fact that the wages question is not to be made an issue, it would seem that the molders are not disposed to find fault with the rate at which they are paid for their work. If this inference is correct, it is unfortunate that they should permit themselves to be made to appear discontented by the demand made in their name for shorter hours. They are now working but the customary day for those engaged in mechanical pursuits, and they are suffering no hardships beyond the lot of their fellow workmen. Eight months of good, solid, serious reflection will probably bring them to this conclusion and dissipate all danger of an issue coming forward from their branch of the industrial army to derange business in the spring of 1889.

The Trade of British India.

We extract from the annual report of Mr. J. E. O'Connor, Secretary of the Indian Office, for the fiscal year 1886-87, recently published, and the "Statistical Tables for British India," Calcutta, 1887, some data bearing on the progress which that country has made of late years, from an agricultural and commercial point of view. The last census was taken on February 17, 1881, when the population was 253,891,821 to an area of 1,382,624 square miles. The railroads in operation have increased from 5077 miles in 1871 to 12,376 in 1886. Their earnings in 1885 were £18,034,465; the expenses, £8,945,283, leaving the net earnings £9,089,182.

The cotton crops have fluctuated in yield a great deal, as the following figures, covering five years, will show:

	Acres under cultivation.	Outturn of cleaned cotton. Cwt.
1880.....	10,708,002	5,237,845
1881.....	11,204,630	5,081,719
1882.....	12,924,196	6,565,456
1883.....	13,851,179	7,227,992
1884.....	13,352,536	4,472,550

The cotton industry has meanwhile developed in a remarkable manner. In 1878 there were in operation 53 factories, with 1,289,706 spindles and 10,533 looms, the value of twist and piece goods exported being 10,543,630 rupees. In 1887 the number of factories had reached 94, with 2,261,561 spindles and 17,455 looms, the amount of export being 42,189,130 rupees. The shipments went to China, Japan, the Straits, Eastern Africa via Aden, and Persia.

The number of coffee plantations has varied between 1887 and 1885 between 38,682 and 47,978 as extremes, there being 44,985 in the latter year, while their product fluctuated between 24,462,453 and 42,932,437 pounds, the yield of 1885 being 34,959,295 pounds. Greater impulse has been given to tea cultivation than to any other agricultural pursuit. The number of plantations was 2330 in 1878, when the area under cultivation was 199,132 acres, and the product 39,183,667 pounds; in 1885 there were 3578 plantations, having under culture 283,926 acres, which turned out no less than 71,520,800 pounds. The great object in view was to supersede Chinese tea among English consumers through good quality combined with cheapness. This process has been going on so steadily

and successfully that after a couple of years no Chinese tea may be used in England.

Indian wheat has qualities which recommend it for certain uses in Europe; it is, for example, as dry as a bone, and hard, hence it is well adapted for mixing with certain species of European wheat, and for Italian macaroni the flour from it has no rival. Last year's crop has not been up to the average, and the yield of the present crop is threatened by want of rain. Shipments to Europe during the first half of the present year compare with the corresponding period in 1887 as follows in hectoliters:

1888.			
	To Eng-land.	To the Con-tinent.	Totals.
From Bombay.....	1,479,000	2,673,800	4,152,800
" Kurrachee....	237,800	92,800	330,600
" Calcutta.....	872,900	136,300	1,009,200
Totals.....	2,589,700	2,902,900	5,492,600
In 1887.....	3,520,600	3,680,100	7,200,700

The indigo crop is suffering from drought in Bengal and Behar; the arrivals of Bengal, Kurpah, and Madras indigo in London during the first six months have been 16,928 chests, against 15,707 in 1887 and 18,284 in 1886. Even brewing has taken a start in India. The number of gallons made in 1879 was only 1,569,026; the amount has more than doubled since, being 3,150,342 in 1885.

The importation of the precious metals into India has diminished; in 1860 to 1873 gold importations reached the aggregate amount of 726,062,000 rupees, whereas the total from 1874 to 1887 did not exceed 348,306,000 rupees; the amount of silver received was respectively during the periods named 1,172,242,000 rupees and 915,811,000. Mr. O'Connor expresses the opinion that the ancient habit in India of hoarding gold and silver is gradually on the wane. The result is that amounts long withheld from circulation in that manner emerge from their hiding places and swell the coin in actual use. In other words, India has ceased to figure among nations as a continual absorber of the precious metals, which is an important fact in connection with the silver question.

The foreign trade movement in India, in thousands of rupees, is shown in the statistics given below:

Merchandise.		
	Import.	Export.
1882-83.....	634,562	843,817
1883-84.....	655,819	891,029
1884-85.....	670,282	850,879
1885-86.....	672,893	849,157
1886-87.....	607,148	901,133

Specie and Bullion.		
	Import.	Export.
1882-83.....	134,532	9,809
1883-84.....	128,780	9,816
1884-85.....	138,788	18,873
1885-86.....	154,778	10,878
1886-87.....	110,533	16,845

Specie and Bullion. Excess of Import over Export.

	Gold.	Silver.
1882-83.....	49,308	74,803
1883-84.....	54,025	64,052
1884-85.....	46,719	72,456
1885-86.....	27,629	116,066
1886-87.....	21,771	71,557

The foregoing tables demonstrate that India is a country in which the export steadily exceeds the import despite the large amounts of railroad and telegraph material that have to be ordered from abroad year after year. It is due to the fact that the bulk of the people, while

being laborious in the field and producing a vast amount of raw material, have not got money enough to buy more than what is strictly necessary.

The Foreign Trade Movement in 1886-87, Reduced to Thousands of Rupees.

Import.	Export.
Sugar..... 20,805	Rice..... 87,648
Beer..... 3,540	Wheat..... 80,259
Liquors..... 7,706	Tea..... 47,280
Wine..... 3,331	Coffee..... 15,023
Provisions..... 11,795	Spices..... 6,122
Salt..... 7,090	Sugar..... 5,048
Spices..... 6,638	Tobacco..... 1,196
Tea..... 3,243	Cotton..... 134,684
Coffee..... 586	Wool..... 8,906
Tobacco..... 1,105	Silk..... 4,843
Silk..... 7,934	Jute..... 48,698

Aden.....	803	7,159	7,962
Germany.....	1,603	7,846	9,449
Turkey.....	1,799	4,705	6,504
Totals.....	583,454	825,664	409,118

American Trade.

Fiscal years.	Import into the United States.	Domestic export.
1878.....	\$12,081,595	\$846,908
1879.....	12,225,770	1,142,196
1880.....	21,022,854	2,218,190
1881.....	18,012,206	858,069
1882.....	18,057,913	3,054,787
Totals.....	\$81,400,338	\$8,160,240
1883.....	\$19,467,800	\$2,185,611
1884.....	19,550,458	3,711,259
1885.....	17,690,257	4,103,675
1886.....	17,247,825	4,350,141
1887.....	18,836,090	3,902,047
Totals.....	\$92,801,430	\$18,252,733

The foregoing tables show that good headway has been made in both directions.

Electric Motors.

Electric motors for low power purposes are becoming more and more prominent. In connection with our recent brief reference to their position in the list of domestic motors, it is of interest to note that they are now made to be operated either by a small battery of a few cells or by a current from an electric light wire, and are capable of successfully performing work for which steam-power would be objectionable. For some years the manufacture of electric motors was in an experimental stage, as usual in the opening up of all new enterprises, but by this time the difficulties seem to have been overcome, and those desiring to use electric motors have a number of patterns from which to make a selection. Prices also have become more reasonable, with increased competition and the progress toward greater perfection made through the in-

creasing attention given the subject. The motors can be started, stopped or reversed by a small lever, which instantaneously controls the motion. Jewelers' and dentists' lathes and drills and similar delicate machinery need a motor of this character, which not only operates at a high rate of speed, but can be instantly stopped and reversed if desired. Sewing machines are a class of machinery to which these motors are well adapted. The battery is placed in the cellar or in a closet out of the way, from which wires convey the current to the motor placed on the table of the machine. It is always ready for use, and when not actually in use it requires no attention to keep it in order beyond an occasional recharging of the battery. Pumping machinery for domestic supply in suburban towns is another field to which these motors can easily be employed, with great comfort, benefit and convenience, as any resident of suburban districts can testify who has been obliged to pump by hand.

The great advantage an electric motor possesses is its adaptability over a wide range of uses for power. While it can be made sufficiently large to take the place of a steam engine of comparatively high power, with economy it can also be made small enough to operate the most delicate machinery, requiring but a small fraction of a horse-power. The isolation of motors is another advantage. They can be placed just where they are needed, no shafting being required for the small motors, the attachment being made directly to the machine to be operated. This will be appreciated by a large class of manufacturers operating special machinery, which is run irregularly and without regard to other operations in the same factory. With the extension of electric light service, the more general introduction of these small motors would seem to be inevitable, their value being already widely appreciated.

Foreign Commerce and War Ships.

In the volume entitled "War Ships of the World," recently issued by the Committee of Lloyd's Register of Shipping, at London, statistics are given showing the merchant shipping and commerce of the principal countries in relation to their respective war navies. The tables inform us that the value of the British merchant navy is about \$465,000,000; that of France being about \$45,000,000; of Germany, \$47,500,000; of Italy, \$21,000,000; and Russia, \$10,000,000. The total British annual imports and exports amount to \$3,090,000,000, of which \$700,000,000 are paid for food. The annual trade of France is valued at \$1,490,000,000, of which \$250,000,000 are for food. Germany has a total annual commerce valued at \$1,465,000,000, of which only \$125,000,000 are expended in food; while of the total exports and imports of Russia, which amount to \$405,000,000, only \$35,000,000 are paid for her food purchases. Associated with these figures, we find that Great Britain has 63,000 tons of merchant steam tonnage to each cruiser or sloop; while France has 12,000 tons; Germany, 24,000; Italy, 13,000, and Russia, 6300. Of merchant steamers to each war vessel capable, of steaming 14 knots, we have 62; France, 7; Germany, 18; Italy, 4, and Russia 10.

The State Mine Inspector of Iowa reports the output of coal in that State in 1887 at 3,864,490 tons, which is about the average production of the past five years.

CORRESPONDENCE.

"The Mission of Mechanical Engineering Schools."

To the Editor: After perusal of the extracts from the presidential address before the Alumni Association of Stevens Institute on June 13, 1888, given in your issue of July 19, as the author of the paper therein referred to I feel it incumbent, somewhat in my own defense, to reply briefly thereto. I quote from the address:

Should every new, important mechanical device, especially if it brings with it new fields of practical employment and labor for the engineer, immediately find its place as a study in the engineering school?

If this be so, the school of mechanical engineering will have to extend its term of study an indefinite extent, and ere long it will come to pass that the young student entering as a beardless youth will graduate from the school as a gray-haired man in the decline of life. For surely if every important machine is to be the subject of special study in the technical school a lifetime will only suffice to cover the ground. And the result?

The result would be that the engineering schools would be of no use in the world, for the world's engineering work would be being done by outsiders, while the gray-haired students, plodding along, would be kept busy studying this very work and not be active agents in its development.

And from the paper:

The steam engine and the printing press have long been held up as the two great civilizers, as the two fields of human effort, to the cultivation of which the extraordinary progress made in human affairs in the nineteenth century is principally due.

Of course among the vast variety of special fields of mechanical study it is not to be expected that in the college course any particular attention can be given to more than a very few of the most prominent subjects, and we very properly find among them the steam engine. * * *

The printing machine of to-day certainly deserves a higher place in our schools as a specialty in applied mechanics than is indicated by the foregoing.

Now, while the writer would not counsel the abandonment of any of the above-quoted specialties of mechanical engineering to give place to the printing machine it would seem, in view of the acknowledged comparative importance of the latter, that it should have a place among them, even at the expense of a portion of the time devoted to some of them, and possibly (bearing in mind that in the time allowed the total quantity of this kind of study must necessarily be limited) to the exclusion of some of the least important.

Now, it will be quite evident, I think, upon examination of the quotations above that the author of the address ignores almost entirely the major premises in the paper, which are:

1. That only a certain fraction of the student's time can be profitably given to the study of special applications and their theoretical acquirement.

2. That the printing machine, as one of these specialties, has been second in importance only to the steam engine—at least until the comparatively recent development of electrical science, and that now it probably is not below the third place.

3. That a considerable number of special studies of less importance than the printing machine, which are enumerated in the paper, do now, and have heretofore, formed a part of the curriculum of the technical schools.

4. That it would be in the interests of the student, and the best form of efficiency for him at graduation, that less time be expended upon the newer and less important special studies in favor of the older, heretofore totally neglected and more important printing machine.

I submit, then, that the address, so far as it is a criticism of the paper, cannot be said to stand on very solid ground.

The writer fully appreciates and cannot but admire the spirit which prompts the alumnus to defend at every point his Alma Mater. It can hardly be said, however, I think, that the address in this instance

recognizes fully that she can best be defended by increasing her strength, and that she would be strengthened by substituting an important for a less valuable study, which, without expending any additional time on this particular kind of investigation, is what the paper advocates.

It is too common a practice, I fear, in discussions of this kind, where opposing arguments are not easily refuted, to set up men of straw, in the absence of the real antagonist, to exhibit the disputant's prowess in knocking them down again. The quotations show, I think, that the author of the address has made himself amenable to this charge in a very marked degree.

JOHN T. HAWKINS.

TAUNTON, MASS., July 23, 1888.

The Tin-Plate Duty.

CHICAGO, July 30, 1888.

To the Editor: The truthfulness of the familiar aphorism, "Every man has his own axe to grind," is daily being verified, an instance of which occurs in connection with the consideration of tariff on tin plate, if the exposition of intent which actuated the deputation of American sheet-iron makers, who have just given evidence before the Senate Committee on Finance, is correct, as is attributed to them in your editorial. It is therein intimated that the agitation displayed by this body of manufacturers at the possible abrogation of tin-plate duty arises from the fear, solely, of destruction to their sheet-making business, and are not actuated by a desire for a suitable tariff with any view of prosecuting tin-plate making in America.

I am glad to see the suggestion you throw out, that these gentlemen should subscribe capital to erect and operate a tin-plate factory, and thus practically demonstrate the necessity of increased tariff for the profitable working of this industry, or the probabilities are that the little duty tin plate already carries will be ultimately wiped out and the matter closed.

With a duty of 50 per cent. more on iron sheet than on tin plate, we know that while it is profitable to manufacture black sheet it is a certain loss to attempt that of its more advanced product in tin plate. By an array of figures we can show the absolute necessity of a specific duty, sufficiently definite and conclusive to any one with even a slight knowledge of the business; but it would seem that we have to incontestably prove to the satisfaction of legislators, by actual performances, what amount of duty should in their estimation be accorded to it, so that the industry may be retained and encouraged, before any prospect of assistance may be expected; this, therefore, is evidently the proper course to pursue, providing, indeed, the Senate now refuse to place tin-plate duty on an even plane with duties imposed on iron and steel sheets, and which in strict business is only natural we should expect from Republican protectionists, having the welfare and development of the country as the apex of their aims and motives. The sheet-makers will start out with a knowledge of incurring a loss on manufacture; it is for them to sustain this tin-plate making loss, if, by so doing, they protect their sheet business from present destruction and ultimately establish the manufacture of tin plate on a paying basis.

If sheet making is worth retention, evidently something more must be done by makers than calling upon Jupiter to pull them out of the mud hole. It is of no use saying that the matter has been already proven from the fact of the works which had started out to make tin plates, years ago, having closed down from inability to compete with imported plates upon the reduction of tariff, as the conditions of manufacture are so entirely dissimilar then and now as to preclude any

contrast—improved machinery, new appliances and inventions wherewith manufacturing costs are so considerably reduced, affording no criterion for formulating comparisons and deducing any results therefrom. Yours faithfully,

WILKINS TRICK.

Washington News.

(From Our Regular Correspondent.)

WASHINGTON, D. C., July 31, 1888.

The divided opinions of the Republican Senators were very suddenly harmonized a few days ago, when it was discovered that it was the President's purpose, should Congress adjourn without action on the tariff in the Senate, to make that a ground for calling the legislative branch forthwith into extra session. It was his intention to give the non-action of the Senate and their disposition to evade the responsibility of the tariff revision and revenue reduction marked prominence in his official summons. When the differing Senators suddenly had their eyes opened to the fact that they were running their heads into a campaign noose they hastily called a caucus, which was held at the residence of Senator Evarts. There were 31 Republican Senators out of the 38 present.

The principal speech of the caucus was made by Senator Allison, who pointed out that not to take any direct action would subject the Republicans to the imputation of being afraid to meet this issue. He also called attention to the determination of the President to reassemble Congress should that body adjourn without action. The wavering Senators were soon brought into line, and, by unanimous consent, the Committee on Finance were authorized to formulate a bill, report it and endeavor to secure its passage. Since this determination the Senate Sub-Committee have continued their work on their bill with renewed vigor.

The features of the bill as it progresses do not materially vary from what has been stated in *The Iron Age*, giving the general outline of the measure as laid down by the committee in their preliminary discussion of the subject. No action has been taken under any of the schedules without a full and free consultation with parties representing such interests and by voluminous correspondence with others. The most important reduction is on steel rails, from \$17 a ton to 7-10 cent a pound. There will be no change in tin plates nor in cotton ties from existing rates. The Republicans of the committee are disposed to place the tin-plate industry on a footing which would afford American capital and enterprise an opportunity to enter that important branch of manufacturing energy, but they claim that this would be a most inopportune time to do anything which would have the appearance of increasing duties. If the people, by the verdict of November on the issue as now presented by parties, should place their unequivocal condemnation upon everything which even squints toward free trade, the party in power would feel justified in embarking in tariff revision on the theory of full protection to every branch of American industry. As Senator Allison expressed it, the present work of the committee is to provide a measure of revenue reduction with as little interference as possible with existing legislation, which would disturb the industrial interests of the country. The plan of the committee is, therefore, to take as much off the internal revenue taxes as possible, and the rest off sugar and alcohol used in the arts. On the removal or reduction of the sugar duty there are some Republicans who are disposed to raise objection; the sorghum interests of Illinois and several other Western States are not favorable to this proposition. They

may be able to bring about some arrangement by means of which this may be modified. There is also an objection to any change in the duty on salt. These important interests in New York are opposed to the House bill, which places salt on the free list, and they warn the Republicans of the Senate against committing a similar error.

The members of the Sub-Committee on Finance are making no special haste to report their bill, as there are several appropriation bills to be disposed of. Another fiscal year expires to-day. It is expected that the Sub-Committee will report their bill to the general committee during the present week. It may not be reported before next week, when a day will be fixed to take it up for discussion until disposed of.

The House is renewing its antagonism to the fortification bill, and there would be some doubt about making any appropriations except for preservation of existing works and armament if it were not for the influence brought to bear upon the Representatives of certain sections, notably those of the great sea coast cities. The Watervliet gun foundry scheme is having a somewhat varied experience. It started in the Committees on Coast Defenses of the Senate and House and next was brought up in the Military Committee and also had been proposed for action in the Sundry Civil bill. General Tracy has followed this question up with great industry and zeal. As the foundry would be located in his district he does not propose to get left if he can help it.

A Large Lake Steamer.—A 2700-ton steamship was launched on the 28th ult., at Reebolt & Walter's yard, Sheboygan, Wis. The new boat will form part of the Milwaukee fleet. In its construction 950,000 feet of timber were used, all of which but 50,000 feet came from Arkansas and Kentucky. Forty-five tons of steel plates, 35 tons of spikes, and 120 tons of round iron were also used. The total cost of the steamship will be \$140,000. The dimensions are as follows: Keel, 276 feet; length over all, 299 feet; beam, 40 feet; molded depth, 26 feet. Both decks are of 3-inch Georgia plank. There are steel cords running in a straight line from forward to aft inside and outside just below the plank-sheer. A steel cord 60 feet long also runs from upper plate down to fore-foot. Another steel cord, $\frac{3}{4}$ x 4 inches, runs diagonally from center to sides, and is embedded in the deck beams. Still another steel cord, $\frac{3}{4}$ x 10 inches, runs under the rail on the outside around the entire boat from stem to stern, between every larch of which there are 84 $\frac{3}{4}$ x 4-inch steel bars running diagonally from center to sides and embedded in the deck beams. The boat is given four spars, with topmasts, and will carry a jib, being the only steamship on the lakes having one. The officers' quarters are commodious and handsomely finished in cherry and antique oak. The engine is triple expansion. The high pressure cylinder is 20-inch bore, the intermediate, 32-inch bore, and the low pressure, 54-inch bore and 42-inch stroke. The boilers are of Scotch type, 11 feet shell and 12 feet long. She has a 13-foot wheel, with a 15-foot lead. The boat is fully equipped with steam-steering gear and other labor-saving appliances.

H. H. Hartman, president of the Hartman Manufacturing Company, of Beaver Falls, Pa., sailed for Europe, on Saturday the 21st ult., on the Cunard steamer Umbria, to be gone about two months. During his absence abroad Mr. Hartman will combine business with pleasure.

A. H. Shipman, inventor of the Shipman engine, died on Monday last, in Geneva, N. Y., of consumption.

"The Crisis in Copper."

Wm. S. Lawson, city editor of the London *Financial News*, has been giving special attention to the position of copper in the world's markets for the past few years, visiting this country twice since 1885. He has just issued a pamphlet, entitled "The Crisis in Copper," which is in the main a reproduction of a series of articles contributed by him to the English press. Among them is one printed in the Edinburgh *Courant* of February 1, 1884, entitled "The Beginning of the Great Fall, 1883," and a second, from the *Times* of August 26, 1885, headed "A Deluge of Copper, 1885," which at the time created a tremendous sensation, and was sharply criticised on this side of the Atlantic.

It is, however, when he deals with the present condition of affairs, and reviews the history of the past six months, that Mr. Lawson's writings are of more immediate interest. The following abstract from an article entitled "The Copper Ring of 1888" is of interest, since it throws some light on the famous syndicate:

What is popularly spoken of as the "Paris Syndicate" is in reality a group of syndicates all working together, but on distinct lines, and without any direct responsibility for each other. The first of them was started so long ago as the early part of last autumn, its members being M. Secrétan and a few of his friends. They were all experts in copper speculation, and, if they are not belied, some of them had a hand in the memorable bear campaign of 1885, which broke the price of copper to under £40 per ton, and produced the doleful situation which M. Secrétan bemoaned the other day in the *Times* and the *Pall Mall Gazette*. Those who watch the copper market closely will have observed that it has a boom almost every autumn. In 1885 and 1886 it was a very mild boom and not long-lived. When M. Secrétan and his friends started in last September, they probably did not contemplate more than the usual autumn flurry. An advance of £5 per ton on copper, and of £2 or £3 per share in Rio Tintos, was, perhaps, the limit of their speculative ambition. Their operations did not, at first, open out very hopefully. They found that they could buy as much copper as they pleased without moving the price appreciably, and they actually secured, in the course of a few weeks, between 30,000 and 40,000 tons, at an average of less than £40 per ton. It was warehoused in London, and financed for them by a bank within a stone's throw of the Stock Exchange.

Meanwhile the rig in tin had reached gigantic proportions and entered on a very exciting stage, the price having been run up in a few months from £105 to over £160 per ton. Accounts vary as to whether or not the Secrétan clique had been engaged in this early maneuver, but the best informed belief is that they were interested in it. At all events, the startling success of the rig in tin first suggested a similar campaign in copper. But the original clique had already their hands full. A new combination was necessary for any large operation, and that, we believe, was not formed till December. Then what may be called the Comptoir d'Escompte syndicate came in. This association did not, as is generally assumed, enter into the gamble, directly or officially. It only supplied from its Board and its *entourage*, financiers of the right sort. No doubt, also, it has found for them the money to gamble with, but they are the gamblers, and not the bank itself. Other financial institutions became parties to the scheme under the same convenient mask. They put no money into it, but they made advances to friends of theirs who wished to go in. In Paris all of them are well known, and quite openly talked about. Next to the Comptoir d'Escompte, the principal supporters of this second syndicate are the Ottoman Bank and the Banque de Paris et des Pays Bas. Its special mission was to engineer a big rise in copper shares, beginning, of course, with Rio Tinto. Here there was more favorable ground to work on than in the copper market itself. Rio Tinto shares were then dirt cheap—in October they had been sold in London as low as 7½—and a huge bear account was open in them on the Paris Bourse. That itself was a splendid lever for the engineers of a boom. The syndicate began buying about 8 or 9, but they did not do this part of the business so skillfully as the capture of the 40,000 tons of copper. Instead of buying quietly and deliberately, taking care not to frighten the market, they went in with a rush, and literally made the shares run away from them. In a little more than a fortnight they had doubled the price and were still buying furiously. Their first 50,000 shares are sup-

posed to have cost them £15 each, and their second 50,000 from £18 to £20. For several days after the failure of the big bear operator, M. Kaltenbach, they bought heavily in order to accelerate his crash, and many of these purchases must have cost them from £20 to £22. Subsequently they lightened the ship of a considerable number of shares; but since then they have always resumed buying when necessary to prevent a bad break.

An ordinary autumn boom in copper rarely lasts more than a month or two, after which the market falls back into its old rut. But, on this occasion, M. Secrétan and his friends did not dare let it take its natural course. Having got their tiger by the tail, they must hold on to him. In order to give the two syndicates time to unload on an unsuspecting public, a third syndicate was needed to prevent the market being flooded with increased supplies of copper, stimulated by the artificial prices the syndicates had created. The bold design was conceived of making forward contracts with the principal copper mines for the whole of their production, one, two, or it might be even three years ahead. The syndicate which had undertaken that colossal responsibility is the most mysterious of the group. All that can be learned about it is that M. Secrétan himself negotiates the contracts in the name of the *Société des Métaux*. So fantastic and grandiose a scheme hardly admits of prosaic criticism, but this much may be said, that a wider transaction is not recorded in the whole history of commerce. The Indian fakir who stands all day swallowing knives and swords has an easy task compared with the Paris syndicates in swallowing the greater part of the next three years' copper production of the globe. They propose to do in real earnest more than Gargantua attempted in burlesque.

Another chapter from the heading "Fallacies of Copper Statistics" is interesting and brings out some points which we believe the American trade does not generally well understand. We quote the following:

Copper statistics are prepared with very great care and ability, but it is impossible to exclude from them a certain amount of guesswork. With experts and people in the trade this does little harm, as it is understood and allowed for; but casual readers will be apt to find their little knowledge of the subject a dangerous thing. For them it is full of pit-falls, example after example of which can be given off-hand.

An English follower of M. Secrétan, on reading the metal report in his morning paper, will be pleased to see that Chili bars are still firm about £81, but he would be grievously mistaken if he assumed that a cartridge maker when he required copper went and bought Chili bars at £81 per ton, or that a smelter in purchasing copper ore paid for it on the basis of Chili bars. Neither of them is such a fool, for he can do much better. The smelter buys what he calls "furnace metal," namely, ore, matte or regulus, £7 or £8 per ton under the Chili bar rate. The latter has, for years past, been a purely speculative standard, and since this copper boom began it has become more so than ever. There is the same difference between it and the current price of manufacturing copper as between the Bank of England rate and that of Lombard street for day-to-day loans. Chili bars form only one-seventh of the total production of the world, and the idea that they determine the price of the other five-sixths is only a popular delusion—harmless enough in a general way, but very misleading in a speculative craze like the present. It would be much nearer the mark to regard them simply as gambling counters. They have little or nothing to do with the trade price of copper, which follows the rates paid by smelters for "furnace materials." All through the recent excitement "furnace materials" have lagged behind Chili bars, and are even yet several pounds per ton below them.

Another pitfall, into which the unwary student of copper statistics may tumble lies in the technical term "deliveries." Even practical men may sometimes be heard speaking about these as if they represented only copper passing into immediate consumption. But ore or matte or regulus going to the smelters is reckoned a "delivery" just as much as fine copper passing into the hands of the manufacturers. The vital difference in the two cases is obvious. Smelters are not, strictly speaking, consumers of copper; they only complete the process of production, and most of them combine with their proper function that of warehousemen. Years ago, when the trade was much smaller, they kept it in a ring fence, being not merely smelters, but merchants and store keepers. They held all the reserve stock; and not only so, but they kept their thumb very firmly on the amount of it. Not a figure or a statistic was ever permitted to leak out

when the old smelters' ring was at the helm. Though now less influential, it is as fond of secrecy as ever. No one in the trade, least of all M. Secrétan himself, has any idea what stocks the smelters have on hand. Thousands—possibly tens of thousands—of tons which have been charged to them as "deliveries," and are supposed to have passed into consumption, may still be in their stores. Whether large or small, their stocks are an unknown quantity in the situation.

"The copper supply" is a very much wider term than they imagine who have undertaken to keep up the price for three years at a minimum of £65 per ton. As we showed before, it comprises old copper, of which there may be thousands of tons quickly available; it includes warehouse stocks, a large portion of which cannot be traced, and is very deceptively treated, as if it had passed into consumption; it is being added to daily by existing mines, which can turn out 270,000 tons per annum, without allowing for any further development. In a few months further additions will be made to it by new mines and old mines reopened. What is to prevent another "deluge of copper" overwhelming the world, as in 1885? If the market could be flooded at £40 per ton, why not at £77 per ton or £70, or even the syndicate minimum of £65? The engineers of the copper corner seem to us to be deliberately challenging such a result. Not only so, but they are working for it with both hands. On the one side they do all they can to reduce consumption, and on the other they are offering bribes for reckless production. Before they know where they are they may have an avalanche of copper on their hands. Already it is coming back from India, one of the world's oldest and largest storehouses of copper. To the Indians copper is almost a precious metal, being hoarded up like gold or silver. Tempted with high prices and their exports will rival those of the Rio Tinto. It would be an excellent business just now for India to exchange inflated copper for depreciated silver. By-and-by, when the copper boom has run its course, and a silver boom is being got up for a change, India may return our silver and take back her copper, making a handsome profit on each.

As bearing on the same general subject, we may quote the following from the next article, on "The Visible Supply of Copper":

The visible supply of copper is the pulse by which its condition and its prospects are tested. Recently it has indicated great feverishness and irregularity. In normal circumstances the best remedy would be to remove the cause of fever and relieve the apoplectic patient by bleeding him. That, however, is what the syndicate dare not do. At the doctor's instigation the patient has overreached himself, and it is the doctor's interest that he should continue overreaching himself. The disease itself cannot be removed without ruin to the doctor, but the symptoms may be modified. The patient's temperature may be cooled artificially—in other words, the increasing glut of copper may somehow be made to look smaller than it is.

We have had frequent occasion to point out that the so-called "visible supply of copper" is only a comparative term. It embraces only the stocks at certain recognized points. No doubt these are the most important storage points, and, when the market is left to itself, they may cover practically all the floating supply available for international commerce. But if, for any conceivable reason, it were desired to create a diversion, or to tone down inconvenient statistics, nothing could be easier than to do so. At this moment nearly, if not quite, three-fourths of the copper production of the world is under contract to M. Secrétan and his associates. As soon as it comes into existence they are its owners; they can say what is to be done with it, and where it is to be kept. If M. Secrétan were to ask the Rio Tinto or the Tharsis Company to let a few thousand tons accumulate at their works, they would, of course, do so. If he were to make a similar suggestion to one or another of the American companies they would be equally obliging. The Panulcillo and other Chilean companies, with which he is on intimate terms, would make no objection to store their copper for him, so long as he paid for it in terms of his contract.

All the metal thus held back is kept out of reach of inconvenient statistics. So long as it is so held it will never enter the visible supply, and to that extent the visible supply will be underestimated. In a dozen other different ways stocks on hand may be rendered unobtrusive. Copper is not a bulky article, nor does it require luxurious accommodation. It needs no shelter from the weather, and may be stacked in the open air if nothing better offers. For aught that is known the *Société des Métaux* may be forming large accumulations of its own works at Rouen. Large quantities of Chili bars have been transferred lately from Liverpool to Havre, and the stocks at Havre

have been greatly increased in consequence, though not so much as they might have been expected to do. Formerly 700 or 800 tons was the average stock of Chili bars kept at Havre and Bordeaux, but at these two ports there are now nearly 5000 tons. Simultaneously the stock of other copper has jumped up from under 1000 tons to 4600 tons. Rouen, though it has never been included in the visible supply, is in fact a much more important storage point than Havre itself. In M. Secrétan's works alone there have frequently been 10,000 tons of copper in stock. There may be that amount now, or there may be even twice as much. When M. Secrétan gets advances from the Bank of France or the Comptoir d'Escompte an arrangement may, without much difficulty, be made for taking a lien on the copper at Rouen or any other point most convenient for him. That would be another side channel into which visible supply might be diverted, and the monthly returns rendered so much the less alarming.

Bad as the statistical position is, we have no safeguard or guarantee whatever against its being even worse than it looks. The visible supply is, as we have shown, a very elastic item, which may be artificially contracted or expanded at the will of powerful manipulators. It represents only the stocks at a dozen or more selected points, and there may easily be 30,000 or 40,000 tons more copper at other points, as to which no reliable information can be obtained. It takes no cognizance whatever of second-hand copper, which is known to have accumulated to the extent of thousands of tons in the hands of smelters and manufacturers. It ignores the stocks held in India on speculation, much of it by the syndicate itself. These were bought up in the early stages of the boom, and are now held at an average of £70 per ton. They are part of the cause of the depression among the Birmingham manufacturers, and they may be the means of prolonging it even after the inevitable fall in the value of copper has taken place. When the demand in India arrives, these accumulations of £70 copper will have to be worked off before there can be an outlet for new shipments. In the same way the stocks of old copper which have been collected by English manufacturers will have to be got rid of before any strong demand can arise for new copper.

If such outside stocks in private hands were added to the official statistics the "visible supply of copper" at this moment would be very much more formidable than the 69,000 tons now weighing so heavily on the market. A direct and practical proof of their magnitude is to be found in the fact that buyers of copper rarely have to go to the syndicate for it. There are smelters and merchants outside of the syndicate who can supply all that is wanted for the daily requirements of business at £5 or £6 per ton under the syndicate price. So limited are the current necessities of the manufacturers that hardly a transaction occurs which would not have been considered a mere bagatelle 12 months ago. The consumption of copper is even smaller than the attenuated deliveries indicate, and the actual accumulations of stock are very much larger than appears in the "visible supply."

Among the other articles making up the series are the following: "What the Ring Has Undertaken," "Birmingham and the Copper Ring," "The Copper Corner in America," "Bolstering the Share Market," "The Copper Companies' Dividends in 1887," and "Hard Facts for the Syndicate."

On the whole, Mr. Lawson takes an extremely bearish view of the situation of the metal, although he recognizes the fact that Secrétan and his followers have the power, and may exercise it, of calling for a reduction in the output of the mines controlled by him, and he suggests that as a last resort the syndicate may be able to induce the companies to lower their contract prices in order to enable it to let the market down easily. Though the corner seems doomed, there are various ways in which it may break up. It may do so violently or gradually, suddenly or cautiously. Eighty pounds per ton copper is an anachronism as difficult to bring back to life as Queen Anne would be.

The new constitution of the Amalgamated Association adopted at the convention of that organization, held in Pittsburgh last month, contains a number of changes, the most important being a clause making a number of other workmen eligible to membership. The new classes of

workmen that are now eligible are: Metal and other stockers, bar bankmen, cinder wheelers, carpenter-millwrights, hollow firemen, shearmen and other crews, tap welders, butt-welders, turners-down, pit-hands, takers off, bar pullers, skelp benders, roll setters, socket-makers and ball grinders working in wrought-iron pipe mills, blacksmiths, machinists, millwrights, greasers, firemen, water-tenders and all hands employed in nail, tack and spike factories, wrought-iron pipe mills, galvanizing works, bolt, nut, washer and other factories and shops run in connection with iron and steel mills, except furnace builders, bricklayers and common laborers.

The Strike at Singer, Nimick & Co.'s Works.—As we predicted in our issue of last week, the strike at the steel works of Singer, Nimick & Co., Limited, at Pittsburgh, has been settled, the firm having gained a complete victory over the Knights of Labor. Every department of the works is now in full operation, and applications are being received every day from old employees who wish to be taken back into the employ of the firm. As we have already stated, the trouble was not one of wages, but was caused by the firm coming to the conclusion to operate their mills in the future independent of the Knights of Labor or any other labor organization. In this they have been wholly successful, and from this time forward their employees will be all non-union men. The effect of this victory is being strongly felt by the Knights of Labor, and a very large number of members have receded from the ranks of that organization, and it is the general belief that in a short time its power among the manufacturing establishments at Pittsburgh will be wholly departed.

Mr. David H. Thomas, superintendent of the Thomas Iron Company, reports to us that in one week No. 3 Thomas furnace, at Hokendauqua, made 511 tons of iron, using three-eighths Lake Superior, three-eighths New Jersey magnetite and two-eighths native hematite, producing 511 tons of iron, of which 171½ tons were No. 1 X, 115 tons were No. 2 and 224½ were plain 2, the quantity of ore charged being 895 tons, and limestone, 290 tons. The fuel consumption was 576 tons, 144 tons being coke. This includes an allowance of 6 per cent. for waste, so that as usually reported the fuel consumption would be somewhat less. We may add that the company are building one set of Durham pipe stoves for No. 1 furnace.

The example of the town of Waldoboro, down in Maine, says the Boston Herald, in erecting and fully equipping a building for the manufacture of shoes, at the expense of \$20,000 for the sole use of a Massachusetts firm which had offered to locate its eastern business there on the fulfillment of these conditions, is rather generous, to say the least. Numerous towns and cities have offered to exempt the property of new business firms from taxation for a time, on condition of their establishing themselves within their limits, but building and fitting out a factory is offering a rather tempting inducement to business concerns. If this sort of thing keeps on, there is nothing which a town may not do in order to bring business to it.

On the 31st ult., the boiler room and bridge house of the Muirkirk Furnace, at Muirkirk, Prince George's County, Md., was burned down, and the furnace chilled. The machinery for crushing ores and other parts of the plant are ruined. Mr. Charles E. Coffin informs us that, while he is insured, the sum will probably not cover half the loss. The destroyed portions of

the plant are to be rebuilt, but as yet it is not known when the furnace will go into blast. Mr. Coffin contemplates putting up an iron stock house and elevator if it can be done cheaply.

Cast-Steel Guns.—A press telegram from Washington, D. C., to Pittsburgh, under date of the 26th ult., gives the following information in regard to the cast-steel gun recently built by the Pittsburgh Steel Casting Company, of Pittsburgh, and which has been sent to Washington for the purpose of being tested. The Pittsburgh cast-steel gun has been moved to the shell-room of the ordnance foundry at the navy yards, and workmen began to-day to remove the unevenness that remains after rifling and cutting the place for the breech. This process of "lapping" out will require some time, but still more time will be required to construct the mechanism of the breech, as all departments are overwhelmed with work. The band for elevating and depressing the gun has also to be put in place. It is thought that the gun will be ready for the test within 30 days. Without special announcement another cast-steel gun, with a bore similar in size to that of the Pittsburgh gun, has recently made its appearance at the Navy Yard. It is from the works of the Standard Company at Thurlow, near Chester, Pa. The Thurlow gun is not yet placed upon the lathe, but lies just as it was received from the foundry.

In his forthcoming report Col. Sydney Maxwell, Superintendent of the Cincinnati Chamber of Commerce, says that last year the receipts of manufactured iron in that city aggregated 155,885 tons, the largest in its history. He says that 108 acres of ground have been secured on the Ohio River, adjacent to Cincinnati, for the erection of the largest and most complete plant in the world for casting iron pipe.

A correspondent writes us: "T. J. Lattner is building a nail factory at Rome, Ga., and was in Pittsburgh last week purchasing machinery, &c., for his works. The nail machines he bought from the American Nail Machine Company, at Ashtabula, Ohio, at the low price of \$110 each. Four years ago these machines sold for \$300 each, with the demand greater than the supply. This condition of affairs can only be accounted for by ruinous competition, overproduction or tariff tinkering."

The National Pipe Bending Company, New Haven, Conn., have been very busy for the last month in the manufacture of their National feed-water heater and coils of iron, brass and copper pipe, for which they have special machinery. They are now making three coils containing 1000 feet each of 1½-inch iron pipe, which are to be shipped to Louisiana; this is the third order for that size coil.

Mayor Hewitt, on Tuesday, appointed four Aqueduct Commissioners—namely, Gen. James C. Duane, until recently chief of the Engineer Corps, United States Army; Francis M. Scott, of the County Democracy, and Assistant Corporation Council since 1885; ex-Assemblyman Walter Howe, Republican, who is a lawyer, and John F. Tucker, a well-known builder.

A bill in Congress proposes to retaliate any discrimination against American vessels passing through the Welland Canal by imposing a toll of 20 cents per ton on all foreign vessels passing through the Sault Ste. Marie Canal.

The blast furnace of the Thomas Furnace Company, of Niles, Ohio, was blown in to-day to manufacture Bessemer pig iron for the trade.

BRAZIL.

PARA. July 24, 1888.—*India Rubber.*—Light receipts during the month have caused our market to stiffen, values, moreover, being favored by the considerable rise in Exchange. July 27.—Our market has advanced 50 reis per kg.; there remain unsold only 10 tons. The arrivals in July will fall off 200 tons from those of July, 1887. Exchange unaltered. *Silver.*—The Government have resolved to withdraw from circulation the 500 and 2000 reis Treasury notes, and replace them by Silver Coin. Some \$7,000,000 worth of Silver will consequently have to be purchased abroad by the Imperial Mint.—*Per cable direct.*

AUSTRALIA.

MELBOURNE. July 13, 1888.—*June Shipments* from Melbourne, Adelaide, Sydney and Queensland to England were composed of 8000 bales Wool, 1100 tons Tallow, 300 tons Copper, 100 tons Copper ore, 8700 cwt. Wheat, 900 tons Flour and 400 tons Tin.—*Per cable via London.*

EAST INDIES.

SINGAPORE. July 13, 1888.—*Tin.*—Our last report was dated 31st ult., since when there is no material change in the position. Buyers offer according to the prices ruling in London, but sellers refuse to part with their old stocks, and the arrivals from the mining districts have been very small. The last transaction was at \$33.50. *Tonnage.*—Steamer rates to London are steady for immediate shipment at 27/6 @ 30/ for weight. For New York via Canal no tonnage offers; via Cape, the Wilhelm Anton, clears to-day, leaving the berth to the Sesi-noora. Rates are unchanged. For Boston the berth is vacant. *Exchange* is quoted 3/1½ for six months' sight.—*Gillilan, Wood & Co.*

MANILA. July 23, 1888.—*Hemp.*—There are buyers at \$9.25 per picul, against \$8.12½ same time last year, equaling cost and freight per ton, £31. 5/, against £27. 13/4. Clearances for the United States since last cable there were none, against 2000 bales last year; ditto since January 1, 99,000, against 125,000; loading for the United States, none, against 11,000. Cleared for Great Britain since January 1, 193,000, against 115,000; loading for ditto, 23,000, against 21,000. Cleared for all other countries, 45,000 bales, against 23,000; receipts at all ports since last cable, 5000, against 7000; ditto since January 1, 328,000 bales, against 257,000 last year and 210,000 in 1886. *Freight*, \$6, against \$5 in 1887. *Exchange*, six months' sight, London, 3/5½, against 3/5½.—*Ker & Co. to Charles Nordhaus, New York, per cable direct.*

CALCUTTA. June 16, 1888.—*Jute.*—The tendency in the Jute market here has been a quieter one for the past ten days. Sales were made of September-November delivery at 27.8 rupees per bale, f.o.b. Balers do not press the sale of later futures. Advices from Narain-gunge are disquieting with reference to the new crop. There have been everywhere in the region either rains or a clouded sky, an unusual kind of weather during the dry season; as, at the same time, the monsoon suddenly set in, the plant cannot mature properly. Hence it is estimated that the yield in Narain-gunge will fall 25% short of last year's. There has been no abatement in the high temperature here of 103° in the shade. The sky is clouded; rain is looked for in a day or two.—*Times of India.*

SPAIN.

BILBAO. July 14, 1888.—*Iron Ore.*—For three months past there has not been the animation noticeable during the present week and fortnight, numerous single cargoes being taken at 6/10 @ 7/3 per ton, Rubios, and at 7/6 @ 8/ Campanil, total shipments to date summing up 2,064,570 tons, as compared with 2,430,300 in 1887. *Pig Iron.*—The export reached 2515 tons, and coastwise shipments 688 tons. The spot price here is 57 @ 60 pesetas, futures 55 @ 58, and Lingotillo, at Huelva and Seville, 65.—*Bilbao Marítimo y Comercial.*

SWITZERLAND.

ZURICH. July 18, 1888.—*Silver Coinage.*—The Federal Council declines to allow Italy, as member of the Latin Union, to recoin its old Bourbon dollars into five-franc pieces and fractional silver coin, as this would only be increasing the silver circulation with which Switzerland, since the late decline in the metal, is being flooded from Italy. Besides, at the last Latin Union conference both the Belgian and Swiss delegates emphatically declared that they

were opposed not only to all new coinage of Silver, but quite as much to recoinage a portion of the five-franc pieces at present in circulation.—*Neue Zürcher Zeitung.*

GERMANY.

HAMBURG. July 21, 1888.—*Iron.*—Pig Iron has continued quiet in Rhenish-Westphalia, the Transatlantic demand for Spiegel does not revive, but the domestic inquiry compensates for this; 10 to 12% is quoted 57 marks. Orders are booked three months ahead. Rolling mills have bought little or no Forge Pig, still being engaged in stock taking as they are, but this interruption will soon cease. Some temporize, because they first want to await the fate of the various syndicates, the continuation of some of which seems precarious. Good quality Forge Pig is worth 50 marks per ton in Rhenish-Westphalia, and 47 to 49 in the Siegen district. Thomas is in brisk demand and very firm; Luxembourg is quoted 38.70. Domestic orders for Merchant Iron will last for three months to come. Although there is still a lack of export demand, the price remains 125 to 127.50. Aggregate sales during second quarter have been considerably below those made during the first quarter. While boiler plates have remained as lively as before, thin sheets are neglected; the Wire Rod export demand does not revive; Machine shops, foundries and car works are all doing well. *Spelter.*—Advices from Silesia state that Spelter production in the province is at present decreasing, together with that of desilverized Lead. The output of Spelter during the first quarter was 20,900 tons as compared with 20,478 tons during the corresponding period in 1887, the deliveries being 19,727, against 16,805; the number of workmen employed was 6047, against 6269; the export from all Germany declined during the first four months from 15,934 tons of Spelter and Scrap Zinc to 14,911 this year, and of rolled from 5425 to 3483 tons. The Hamburg market for Spelter has remained firmly sustained. German Lead is rising and now commands 13.60 marks per 50 kg., while Copper is weaker.—*Borsenhalle.*

Strikes and Lockouts.

The "Report upon Strikes and Lockouts" compiled under the supervision of Hon. Carroll D. Wright, Commissioner of Labor, has just been issued from the Government Printing Office. It covers the period of six years, ending December 31, 1886, and is very thorough in its details of the subject. In fact, the ponderous volume of 1172 pages would be of little use except to specialists were it not for the excellent analysis of the tables which Mr. Wright has compacted into 25 pages. Great pains have been taken to insure the accuracy of the report, and it may be accepted as a complete and correct history of the matter undertaken, or at least as nearly so as could be possibly obtained.

OBTAINING THE DATA.

The methods under which this investigation has been conducted were as follows: The files of all the leading newspapers, trade journals and commercial periodicals published in the United States during the years involved in the investigation were searched for all references to strikes. The agents of the Bureau of Labor were thus supplied with primary evidence of the existence of strikes, the names of the parties interested and the establishments concerned. They were also instructed to make diligent inquiry in all directions for other strikes, especially from labor organizations and manufacturers' associations. The Commissioner of Labor believes that by these means the Bureau has secured information relating to nearly every strike, if not every strike, which has occurred in the United States during the six years ending December 31, 1886.

Four leading causes of strikes are: for increase of wages, for reduction of hours, against reduction of wages and for increase of wages and reduction of hours. These were the causes of the strikes in 77.16 per cent. of the establishments. Strikes were made in 800 establishments for reduction of hours and against being compelled to board with employer.

It is shown by the summaries that out of the whole number of establishments affected success followed the strikes in

10,375 establishments, or 46.52 per cent. of the whole; partial success was gained in 3004, or 13.47 per cent. of the whole, and failure followed in 8910 establishments, or 39.95 per cent. of the whole number, and strikes were still pending in 15 establishments on December 31, 1886.

For lockouts 564 establishments, or 25.47 per cent. of the whole, succeeded in gaining their point; 190, or 8.58 per cent., partially succeeded, and 1339, or 60.48 per cent., of the whole failed, while lockouts were still pending in 121 establishments, or 5.47 per cent., on December 31, 1886.

THE LOSSES ENTAILLED.

The loss to the strikers for the period involved was \$51,814,723. The loss to employees through lockouts was \$8,157,717, or a total wage loss to employees of \$59,972,440. These losses occurred in 24,518 establishments, being an average loss of \$2446 to each establishment and of over \$40 to each person involved. A table is given showing the number of days required for employees to recover wage losses in wholly successful strikes for increase of wages.

The extreme cases are a laborer's strike in New York, in which the average wages lost were 61 cents and the time to make up the loss was only one day, and a strike of binders and trimmers of fur hats at Danbury, Conn., in which the wages lost were \$19.24, and the increase gained was only 1 cent per day, so that it required 1924 days to make good the loss. The average wages lost per employee in all the successful strikes was \$20.42, the average gain in daily wages was 27 cents, and the average time to make up the loss was 76 days.

Mr. Wright thinks that the turning point was reached in 1886, and that it can be emphatically stated that strikes are now on the decline.

The chapter upon strikes and lockouts prior to 1881 contains much interesting information. The first strike of record was that of the journeymen bakers in New York city in 1741. They were tried for a conspiracy not to bake until their wages were raised, and convicted, but it does not appear that any sentence was ever passed.

SOME OLD-TIME STRIKES.

In 1796, 1798 and 1799 the journeymen shoemakers of Philadelphia struck for higher wages and were successful. In November, 1803, a strike occurred in New York City which is commonly known as the "Sailors' strike," and which has been generally considered as the first strike in the United States. A number of sailors struck for an increase of pay from \$10 to \$14 per month. They marched around the city and compelled other seamen to leave their work, but were put to flight by the constabulary, who arrested their leader and lodged him in jail. The strike was a failure.

A very singular strike occurred in 1817 in Medford, Mass. Thacher Magoun, a shipbuilder, notified his men that he would not furnish them with the customary grog, and that no liquor should be used in his shipyard. The men wrote the words "No Rum! No Rum!" upon each stick of timber in the yard, and some of them refused to work, but finally gave in.

This was paralleled by a general strike of employees upon the railroad between Reading and Hamburg, Pa., in 1839, where the demand was for an increase of pay from \$1 to \$1.12½ per day, and for more whiskey, the allowance being a pint and a half per day to each man, dealt out in nine doses.

The compilation of the statutes of the different States concerning strikes, combinations, conspiracies, intimidations, boycotts, &c., shows that Maryland, New Jersey and New York have enacted laws authorizing combinations of workmen to secure advances in wages.

TRADE REPORT.

Chicago.

Office of *The Iron Age*, 95 and 97 Washington St.,
CHICAGO, July 30, 1888.

Pig Iron.—The increased business which has been threatening for some time made its appearance last week. Buyers took hold very liberally in several lines, notably in Lake Superior Charcoal and Ohio Softeners, with also some regard for Southern Coke. The sales of Lake Superior Charcoal and Alabama Car-Wheel aggregated over 20,000 tons, distributed among Malleable Casting and Car-Wheel manufacturers and the Agricultural Implement trade. Several thousand tons of Southern Coke and Ohio Softeners were also disposed of. Although these sales constitute a regular feature of the trade at this time of the year, and therefore do not indicate in themselves a radical change in the market, yet a good feature of the situation is the fact that the buyers were not able to break prices to any extent. One or two contracts for Lake Superior Charcoal were placed at quite low figures, but most of the orders were based on \$19 and \$19.50, cash. The lowest sellers are now in a position to demand an equal price with the balance of the trade and insist that they will no longer make concessions. Lake Superior Coke was not in as strong demand as some other Irons; nevertheless a considerable number of small orders were booked. The makers of Coke Irons, both Northern and Southern, are now disinclined to take orders extending beyond this year, while most of them are endeavoring to shorten the time to three months. Cash quotations are as follows, f.o.b. Chicago: Lake Superior Charcoal, all numbers, \$19 @ \$19.50; Alabama Car-Wheel, \$26.25; Southern Charcoal Foundry, No. 1, \$18 @ \$19; Jackson County Softeners, No. 1, \$17.50 @ \$18; Hocking Valley, Soft Foundry, No. 1, \$16.50 @ \$17.50; American Scotch (Blackband) No. 1, \$18.25 @ \$19; other Ohio Scotch Irons, No. 1, \$17.50 @ \$18; Lake Superior Coke, No. 1, \$17 @ \$17.50; No. 2, \$16 @ \$16.50; No. 3, \$15 @ \$15.50; Southern Coke, No. 3, \$17; No. 2 and Open Bright, \$16.50; No. 3, \$16; No. 1 Mill, \$15.50.

Bar Iron.—The heavy inquiries from the Agricultural Implement trade alluded to in last week's report have not yet been placed, but will be very shortly. They will probably be 25 % in excess of the orders placed last year, owing to the prosperous condition of the farmers. Jobbers and small consumers are in the market for a considerable quantity of Iron, but the mills are slow about starting up and agents are somewhat at sea in making quotations for early deliveries. The usual rate for carload lots is 1.85¢, half extras, f.o.b. Chicago, for Common Iron, but some sellers ask more, while a few are willing to shade this quotation for satisfactory specifications and deliveries. The organization of Western Bar Iron manufacturers is expected to play an important part shortly in regulating production and preventing the cutting of prices. Store quotations range from 1.90¢ to 2¢, according to quantity and quality.

Structural Iron.—The demand has been quiet of late, except for small lots from store, which are freely called for. A contract for an Iron swing-bridge across the Calumet River was awarded to P. E. Lane & Co. for \$6392. Mill lots quoted as follows, f.o.b. Chicago: Angles, 2.20¢; Universal Plates, 2.25¢; Tees, 2.45¢; Beams, 3.40¢; Store prices are as follows: Angles, 2.40¢ @ 2.70¢; Tees, 2.60¢ @ 2.90¢; Beams and Channels, 3.80¢.

Plates, Tubes, &c.—A very large business has been transacted in Plates. Although the mills have advanced their rates on Tank and Heavy Sheet Iron and on large lots of Boiler Tubes, the local dealers have as yet made no change in their prices and still quote as follows: Heavy Sheets, Nos. 10 to 14, 2.65¢; Tank Iron, 2.55¢; Tank Steel, 2.80¢; Shell Iron, 3¢; Shell Steel, 3.25¢; Flange Iron and Steel, 4¢; Fire-Box Steel, 4.75¢ @ 5.75¢; Boiler Rivets, 4¢ @ 4.25¢; Ulster Iron, 3.75¢; Boiler Tubes, 60 % and 10 % off on 2½-inch and larger and 62½ % off on 2-inch and smaller.

Sheet Iron.—Brokers are now having much difficulty in finding mills ready to take orders for Black Sheets, as many have their capacity engaged, and others are not running. Those in a position to handle some of the business offered ask 2.95¢ @ 3¢, f.o.b. Chicago for No. 27. Jobbers quote 3.10¢ @ 3.20¢ from store for small lots of No. 27, and are having a good demand from the trade.

Galvanized Iron.—Manufacturers' agents report another heavy week. Cornice-makers, car builders and other classes of consumers have taken large quantities. They find prices more easily sustained. Small lots continue to be quoted at 60 % and 5 % off for Juniata, and 60 % and 10 % off for Charcoal.

Merchant Steel.—The heavy consumers are now soliciting bids for their year's supply, and it is reported that some of these orders have already been placed at prices approaching those prevailing two years since. Store trade has been excellent, the orders though small being numerous. Quotations range as follows: Bessemer Bars, 2.30¢ @ 2.50¢; Tool Steel, 8¼¢ @ 9¼¢; Specials, 13¢ @ 25¢; Crucible Spring, 4.40¢; Open-Hearth Spring, 2.90¢; Open-Hearth Machinery, 2.75¢ @ 3¢; Crucible Sheet Steel, 7¢ @ 11¢.

Steel Rails.—A few contracts are under negotiation, but no sales have been made for some time, and the local manufacturers are fast approaching the last of their orders. They are inclined to take some encouragement from the crop reports and from the recent decision of Judge Brewer in the Iowa railroad cases, both of which will have a favorable effect on railroad earnings and railroad securities, thus leading to purchases of Rails, but the benefits thus expected are remote. In the absence of business quotations are nominal.

Old Rails and Wheels.—Sales of Old Iron Rails are reported at \$19, \$19.50 and even \$20. A sale of 1000 tons at an interior point was made at \$19.50, and another lot brought \$18.50 on the Ohio River, equal to \$19.50 or \$19.75 here. The supply is now quite limited, while there are numerous inquiries from consumers willing to pay \$18.75 @ \$19, but who feel that \$19.50 @ \$20 is too high in proportion to the price of Bar Iron. Old Car-Wheels are a trifle higher and could now be sold at \$19, but they seem to be very scarce.

Scrap.—Wrought Scrap is lower, with very little moving. A moderate demand is experienced for cast. A limited sale has been found for Borings and Turnings, but they are only wanted at low prices. Steel is very quiet. Mixed Country Scrap is quoted at \$11 @ \$11.50. Selling quotations for carefully selected are as follows, per ton of 2000 lb.: No. 1 Forge or Railroad Shop, \$16.50 @ \$17; Track, \$16; No. 1 Mill, \$12 @ \$12.50; Light Wrought, \$8; Horseshoes, \$16.50; Axles, \$22; Cast Machinery, \$12 @ \$12.50; Stove Plate, \$9.50 @ \$10; Cast Borings, \$7.50 @ \$8; Wrought Turnings, \$10; Axle Turnings, \$11.50 @ \$12; Coil Steel, \$13; Leaf Steel, \$14; Locomotive Tires, \$14.

Hardware.—A very good trade is reported from jobbers in Shelf Hardware. The demand is now running largely to fall goods, such as Sheet Iron, Nails, Tin Plate, Tinnery's stock of all kinds, Stove Boards, Coal Hods, Stove Furniture, &c. Prices are being steadily maintained, and in nearly every respect the condition of this branch of trade is highly satisfactory. Jobbers in Heavy Hardware are feeling a little improvement in their trade also, particularly in the demand for Wagon Material.

Nails.—Although manufacturers' agents report actual business as very slight in volume, they are in constant receipt of a stream of inquiries, indicating the anxiety with which the course of the market is now being watched. Any indication of prices hardening would doubtless cause a rush of orders. Large lots of Steel Nails from factory are still quoted at \$1.90 @ \$1.92½, f.o.b., Chicago, for ordinary specifications, while small lots from store are held at \$2.05. Jobbers quote Wire Nails at \$2.50 @ \$2.60.

Barb Wire.—Trade is very dull, most of the factories being shut down for repairs, and the jobbers making no effort to force business. Small lots are still quoted at 3¢ for Painted, and 3.75¢ for Galvanized.

Pig Lead.—Manufacturing consumers have purchased quite freely, both spot and futures, taking in the aggregate over 600 tons, which was bought at 3.85¢ @ 3.90¢. The tone of the local market has been very firm and values have been well maintained, 3.90¢ being bid for Desilverized at the close of the week.

Copper.—The negotiations referred to last week are still continuing, buyers hoping to get lower figures and sellers resisting.

Philadelphia.

Office of *The Iron Age*, 220 South Fourth St.,
PHILADELPHIA, Pa., July 31, 1888.

Pig Iron.—The market has maintained a firm tone, and, although there are no changes in quoted rates, holders appear to be gaining confidence, so that, as compared with last week, the position is probably a shade better. In any case the disposition is to ask full prices, while requests for concessions are not entertained for a moment. Still there are no indications of any important changes, as there is plenty of Iron for sale yet, although not precisely such brands as consumers would prefer. But on any slight advance it is believed that the supply would soon be increased, so that consumers are in no hurry to place orders at advanced prices. The position is carefully watched, however, the feeling of confidence being so general that people are inclined to look only on one side of the market, and that for the present is the bright side. But, as already stated, while consumers are willing to buy liberally, and have bought liberally at the old prices, they are not ready to pay an advance, unless for small lots, or under special circumstances. The sellers' standpoint is about as follows: Those who make really good Iron have already sold as much for forward delivery as they care to sell, and are asking a small advance on new orders. Those who occupy a less favorable position in the trade are still quoting the old prices for prompt deliveries, but are not generally willing to accept orders for delivery later than October. This statement fairly covers the entire field, so that further comment seems to be unnecessary. Sales during the week taking the extreme limits at both ends have been as follows for tidewater deliveries: No. 1 Foundry, \$18 @ \$19; No. 2 do., \$16.75 @ \$17.50; Gray Forge, \$15.75 @ \$16.25. Southern Irons might possibly be had for

less money, but there is no demand, and no offerings at prices likely to prove acceptable to buyers.

Foreign Iron.—Prices are entirely nominal, as there is no demand, and no inquiries likely to lead to business at present. Asking prices are as follows: Bessemer, \$19 @ \$20, c.i.f., duty paid, and 20 % Spiegel, \$26 @ \$26.50.

Blooms.—Steel moves fairly in small lots. Prices about as follows: Slabs and Billets from \$29 to \$35, f.o.b. cars at mill, according to analysis; Charcoal Blooms, \$52 @ \$54; Run-out Anthracite \$42 @ \$44; Scrap Blooms, \$34 @ \$35 per "bloom" ton of 2464 lb. Foreign at tide, c.i.f., duty paid, \$29 @ \$30 for Nail Slabs; \$31.50 @ \$32.50 for 4 x 4 Billets, and \$35 @ \$39 for Siemens-Martin, price according to analysis, &c.

Muck Bars.—The demand is improving, and sellers find the market still in their favor. Sales during the week have been made at \$27 @ \$27.50, delivered, with a general disposition to stand out for \$27.50 @ \$28, delivered.

Bar Iron.—There is very little doing in Bars, and such demand as there is is met at very irregular prices. Some quote 1.85¢, firm, while others claiming to make strictly refined Iron are willing to shade 1.8¢, and still others go considerably below that figure; all depends on what a buyer is willing to accept as first quality. Skelp Iron is in better demand, however, and sales of about 2000 tons of Grooved are reported at somewhat higher figures than quoted a week ago. Sellers ask 1.82½¢ @ 1.85¢, delivered, but it is reasonably certain that the sales in question were at lower figures than these. But there is no doubt that manufacturers feel more confident of their position, and for the present, at least, will stand out for better prices.

Plate and Tank Iron.—There is nothing materially different from last week. Business in small lots is fairly active, but there are no large orders on the market, and mills do very little more than hold their own. Still the tendency toward improvement in other branches imparts a more hopeful feeling, and manufacturers believe that their turn will come soon. Meanwhile prices remain as before, say: Ordinary Plate and Tank Iron, 1.95¢ @ 2.05¢; Shell, 2.4¢ @ 2.5¢; Flange, 3.5¢; Fire-Box, 4¢; Steel Plates, Tank and Ship Plate, 2.3¢ @ 2.4¢; Shell, 2.7¢; Flange, 3¢ @ 3½¢; Fire-Box, 3½¢ @ 4½¢.

Structural Iron.—There is no great activity in this department, but there is a fair business nevertheless. Most of the mills have portions of unfilled contracts to work on, and this with a very good current demand keeps them pretty well employed. There is nothing in the near future likely to cause any particular change, although there are the usual hints of good things to come, but the dates not fixed. Prices same as before—viz.: 2¢ @ 2.10¢ for Bridge Plate; 2¢ @ 2.10¢ for Angles; 2.6¢ @ 2.7¢ for Tees, and 3.3¢ for Beams and Channels, Iron or Steel.

Sheet Iron.—The demand for good Sheets is said to be satisfactory, and the entire current output is taken at fair prices. There is the usual pressure to sell inferior qualities at comparatively low prices, but the demand is for the best makes, for which quotations are as follows for small lots:

Best Refined, Nos. 26, 27 and 28... 3¼ @ 3½¢
Best Refined, Nos. 18 to 25... 3 @ 3¼¢
Common, ½¢ less than the above.
Best Bloom Sheets, Nos. 26 to 28... 4½ @ 4¾¢
Best Bloom Sheets, Nos. 22 to 25... 4 @ 4¼¢
Best Bloom Sheets, Nos. 16 to 21... 3½ @ 3¾¢
Blue Annealed... 2.8 @ 3¢
Best Bloom, Galvanized, discount... 62½¢
Common, discount... 67½¢

Steel Rails.—There is very little business doing in this market, owing probably to lower quotations at mills further West. Small lots are quoted at \$30 @ \$30.50 at mill, but on firm offers for good-sized lots prices would doubtless be shaded to good buyers, but in the absence of such demand quotations are held as above, \$30 @ \$30.50 at mill.

Old Rails.—No sales have been reported in this market for some time past, but lots for delivery at mills near by have been sold at about \$22. Lots in store or afloat for this port are offered at \$22 @ \$22.50, but at present there are no bids at over \$21 Philadelphia.

Scrap Iron.—Market dull, and prices irregular. Small lots of good quality command about the figures quoted below, but the market will not bear much pressure: Asking prices, \$18 @ \$19 for cargo lots; \$20 @ \$21 for carload lots, delivered, or for choice \$21.50 @ \$22; No. 2 do., \$14 @ \$15; Turnings, \$13 @ \$14; Old Steel Rails, \$19 @ \$20; Cast Scrap, \$14 @ \$15; do. Borings, \$9 @ \$10; Old Fish Plates, \$24 @ \$25. Old Car-Wheels, \$17 @ \$18, Philadelphia, or its equivalent.

Wrought-Iron Pipe.—The improving condition of trade in this department noted last week continues, and manufacturers are meeting with a fair demand. Discounts are quoted as follows: Black Butt-Welded 55 ¢; on Galvanized do., 45 ¢; on Black Lap-Welded, 65 ¢; on Galvanized do., 52½ ¢; on Boiler Tubes 60 ¢.

Nails.—There is no change from last week, although in sympathy with the firmer feeling in other departments manufacturers are inclined to stiffen up a little. Lots from store are nominally about \$2.05, with the usual discount on large lots.

Chattanooga.

Office of *The Iron Age*, Carter and 9th Sts.,
CHATTANOOGA, July 30, 1888.

Pig Iron.—All developments during the past week show a decided stiffening up in prices, a much better demand and a general tone of encouragement throughout all the Iron districts of the South. Sales for round lots are being made without much correspondence, and in many instances at 25¢ to 50¢ in advance of the market, as it was a few days ago, and the general opinion appears to prevail that prices will go up at least \$1 before the summer closes. There have been sales of about 7000 tons to remain in the yard, for some of which spot cash has been paid. This appears to be very good evidence that parties who have some surplus in money have confidence that Iron will advance. The quoting prices at which the bulk of sales were made during the past week was \$14 for No. 2, and \$15 for No. 1; at the same time many were made at prices both above and below these figures, therefore, the market could not be quoted as steady.

Miscellaneous.—As the summer advances so also does the prospect of very abundant crops of all kinds develop. The subject of watermelons may not be very proper in this place, yet a few statistics may not be uninteresting. Information obtained from some of the shipping agents shows that so far the E. T., Va. and Ga. line have shipped 850 carloads; the Central System of Georgia, about 2000 carloads; the S. F. and W., about 2700 carloads; the S. C. and Port Royal, about 350 carloads, and from Augusta proper, about 50 carloads, making about 5950 carloads of melons so far this season. To this may be added about half as many more from Western Alabama, Louisiana and Mississippi, making nearly 9000 carloads. These net the grower from \$75 to \$150 per car, or nearly \$1,000,000. The

freight on these melons averages the lines from \$18 to \$35 per carload, or say \$225,000. The special agents who are detailed to look after these shipments state that the acreage will be doubled the coming year.

Cincinnati.

CINCINNATI, July 30, 1888.

Pig Iron.—There has been further improvement in the temper of the local Pig Iron market during the past week. There has been an active inquiry for both Mill and Foundry grades, and while the supply of Foundry has been ample there has been a scarcity of Mill Iron for prompt delivery. The volume of business has been materially increased since the rise commenced, but there is considerable irregularity in quotations. Ohio Irons may be obtained on a lower basis, relatively, than Southern grades, except Silvery and Softeners, but while there are several weak furnaces, the majority are demanding higher prices. Some large contracts have been placed during the week by agricultural works, car-wheel manufacturers and rolling mills, with other contracts in progress. While sales have been more largely of Foundry Irons the reason has been because of the scarcity of Mill Iron for immediate delivery. Silver Gray Iron is reported to be especially abundant, but this condition will probably be but temporary. The sales of both Mill and Foundry grades have been made for delivery during the next six months, and among the sales may be noted 3000 tons No. 1 Southern Coke Foundry at about \$16 @ \$16.50 for long delivery, 2000 tons No. 2 Southern Coke Foundry Iron at \$15.50, and several carload lots at \$15.75, cash, here; 1000 tons No. 1 Southern Mill Iron at about \$14 @ \$14.25, and moderate amounts of No. 2 Mill Iron at \$13.50 @ \$13.75; 2000 tons of Southern Car-Wheel Iron, Hanging Rock, equivalent to \$25, cash, here, and 5000 tons of Lake Superior Charcoal Iron at about \$20 @ \$20.25, cash, Cincinnati. Several 100-ton lots of Mottled Iron have sold at about \$12.75, cash, here. Beyond the confidence and increased volume of business there are no new features. Prices current here, cash, f.o.b., are approximately as follows:

Hot-Blast Foundry.

Southern Coke, No. 1.....	\$16.50 @ \$17.00
Southern Coke, No. 2.....	15.50 @ 16.00
Southern Coke, No. 3.....	14.50 @ 15.00
Ohio Soft Stone Coal, No. 1.....	17.00 @ 17.50
Ohio Soft Stone Coal, No. 2.....	15.50 @ 16.00
Mahoning and Shenango Valley.....	16.50 @ 17.00
Hanging Rock Charcoal, No. 1.....	20.50 @ 22.50
Hanging Rock Charcoal, No. 2.....	19.00 @ 21.00
Tennessee and Alabama Charcoal, No. 1.....	17.50 @ 18.00
Tennessee and Alabama Charcoal, No. 2.....	16.50 @ 17.50

Forge.

Strong Neutral Coke.....	13.50 @ 14.00
Mottled Neutral Coke.....	12.50 @ 13.00
No. 1. Mill Coke.....	14.00 @ 14.50
No. 2. Mill Coke.....	13.50 @

Car-Wheel and Malleable Irons.

Southern Car-Wheel.....	20.00 @ 23.00
Hanging Rock, Cold Blast.....	22.00 @ 25.00
Lake Superior Car-Wheel and Malleable.....	20.00 @ 21.00

Manufactured Iron.—Harmony having been restored among the mills and their workers, there has been more activity on the part of all concerned. Mills have bought more freely and have taken contracts for next year's delivery at about the basis of quotations previously named: Bar and Sheet Iron—Common Bar Iron, 1.90¢ @ 2¢; Charcoal Bar Iron, 2.90¢ @ 3¢; Sheet Iron, Boiled, Nos. 10 to 27, 2.50¢ @ 3.25¢; Sheet Iron, Charcoal, Nos. 15 to 25, 3½¢ @ 4½¢ lb.

Nails.—There has been a liberal supply of all kinds and only a moderate jobbing trade without change in quotations. Sales of round lots are made from the mills on the basis of 15¢ lower than quotations. Jobbing prices are based upon 12d @ 40d,

which sell at \$2 3/4 keg, with 10¢ rebate in carload lots at mills; 50d @ 60d, 25¢; 10d, 10¢; 8d @ 9d, 25¢; 6d @ 7d, 40¢; 4d @ 5d, 60¢; 3d, \$1, and 2d \$1.50 per keg more. Steel Nails sell at \$2 and Steel Wire Nails at \$2.65 @ \$2.75 3/4 keg.

Old Material.—There has been a more active demand for Old Rails, and some sales of moment have been reported at about \$19.50, cash, here. There has also been an improved demand for Old Wheels, but they have been more freely offered at \$18.50, cash, Cincinnati.

Louisville.

LOUISVILLE, KY., July 30, 1888.

Pig Iron.—The condition of the market during the past week has been about the same as last. Offers have been made quite freely for large amounts of Iron, but furnaces are rather slow in accepting same at present prices. As yet there has been no advance in prices since last week, but from the present outlook we think buyers may expect a slight advance at any moment. We think it advisable for those needing Iron for the balance of the year to buy at prices now prevailing, as, from the present view of the market, there appears to be no prospect of a decline, and indications point strongly to an advance. Placing ourselves in the position of those needing Iron, we would most assuredly take advantage of the present market. Several large Southern furnaces have suspended operations for the present and are unable to state when they will resume. We quote for cash as follows:

Southern Coke, No. 1 Foundry	\$18.00 @	\$17.00
" No. 2	15.00 @	16.00
" No. 2 1/2	14.50 @	15.00
Hanging Rock Coke, No. 1 Foundry	16.50 @	17.00
" Foundry	20.50 @	22.25
Southern Charcoal, No. 1 Foundry	17.25 @	17.75
Silver Gray, different grades	13.25 @	14.25
Southern Coke, No. 1 Mill, Neutral	12.75 @	13.75
" No. 2	12.25 @	13.25
" No. 1 " Cold Short	12.25 @	13.25
Charcoal, No. 1 Mill	13.25 @	14.75
White and Mottled, different grades	12.00 @	12.50
Southern Car-Wheel, standard brands	21.50 @	24.50
Southern Car-Wheel, other brands	18.50 @	20.50
Hanging Rock, Cold Blast	22.50 @	24.50
Hanging Rock, Warm Blast	18.50 @	19.50

Cleveland.

CLEVELAND, July 30, 1888.

Iron Ore.—Prices are a little firmer. The very high grade Ores, which sold two weeks ago for \$5.50 @ \$5.75, are now held at the latter figure although, as a matter of fact, but little of this quality remains unsold. The advance in Lake freights and the scarcity of many of the Bessemer Ores accounts for the stiffening up of the market. Sales of Hematite Ores, just below the Bessemer limit are reported to-day at \$4.60. Sales of non-Bessemer Menominees for Eastern delivery, at figures equivalent to \$3.80, f.o.b. vessels Cleveland, are also made public. It is becoming quite evident that mining companies will have demands for more Ore than they are now prepared to produce. Increased facilities at the mines are being discussed. Gogebic Bessemer are so well sold up that a local dealer is said to have been unable to fill a 25,000-ton order last week, although \$4.80 was offered. Ores from some of the mines in this district have been sold during the past seven days for \$4.70 @ \$4.75. The total shipments to date from the upper Lake ports aggregate 1,650,000 tons, as against 1,825,000 tons shipped up to a corresponding period last year. The Gogebic range has exceeded its shipments of last season by about 375,000 tons. The Norrie and Colby mines will together ship about 500,000 tons; the Ashland and Aurora combined about 250,000 tons, while the other mines in this district are calculated to bring the season's

output up to about 1,225,000 tons. The other ranges will fall below last season's record, the estimated output now being: Gogebic district 1,225,000 tons; Marquette district, 1,400,000 tons; Menominee district, 1,000,000 tons; Vermillion district, 450,000 tons.

Pig Iron.—Prices, although no higher than one week ago, are firmer, and consumers are buying more liberally. The demand at present so far exceeds the production that stocks are clearing up, and better quotations are looked forward to with every degree of confidence.

Manufactured Iron.—Bar Iron is selling at 1.65¢ @ 1.70¢. There is an active inquiry for sheets at 2.70¢ for No. 24 and 3¢ for No. 27. The mills are crowded with orders from bridge builders for special shapes.

Scrap Iron.—Miscellaneous and Wrought Scrap is very dull, extra heavy Axles, however, being in fair demand. Two or three small lots of Old American Rails have sold during the week at \$20.25.

Coke.—The demand is still heavy, with price at the ovens \$1 3/4 ton.

Pittsburgh.

Office of The Iron Age, 77 Fourth Ave.,
PITTSBURGH, July 31, 1888.

The Iron lockout is a thing of the past, but the mills have not all been started up yet, nor have all mill firms signed the scale, but they will be obliged to do so before resuming business. So far as the volume of business is concerned it is increasing, but there is no improvement in prices, and herein is where the great trouble lies. There never was a larger business in raw Iron than there has been during the past two weeks in this district; included in the sales reported were several large blocks. As a rule the improvement in the products succeeds that in the raw article, and consumers generally have been, to some extent, anticipating future wants. The feeling is gaining ground that there will be a large business this fall, but whether it will be sufficiently so to enable mill owners to realize better prices remains to be seen. The reports both from the West and South are very generally favorable, and these reports are not without their effect, as our Pittsburgh manufacturers are largely dependent upon those sections for a market for their products. While the Amalgamated Association managers feel considerably elated over their recent victory, and, not without reason, yet they, as well as the Knights of Labor, have also suffered a number of defeats; the latest one of the latter is the Steel works of Singer, Nimick & Co., which is now a non-union mill; while paying the same wages allowed by other mills, the proprietors refuse to recognize any labor associations; they treat directly with their men. A number of other concerns are running non-union, including the Black Diamond Steel Works, Park, Bro. & Co., Solar Iron Works, Wm. Clarkson, McKeesport Iron Works, W. D. Wood & Co., Edgar Thomson Steel Rail Works, Carnegie, Phipps & Co. and the Natrona Salt Works, each employing a large number of men. It is probable that other manufacturers will do likewise, as soon as they see their way clear. It is not so much the matter of wages as a desire on the part of employers to be free to treat with their employees directly and personally; they want to exercise the right to hire and discharge without dictation from committees of labor associations, and this is one of the strongest reasons for employers breaking loose from these labor organizations.

Pig Iron.—There is no abatement apparently in the demand; sales continue large. Sales of some 30,000 tons have

been reported during the past couple of weeks; however, this was not altogether unexpected, as it was not known that all the mills when they closed down July 1 had little or no stock, and they had to replenish before starting up. While the market is firmer, prices have undergone no change as compared with those of a week ago; some furnacemen are refusing to accept lower rates, but consumers have no trouble in obtaining about all they want. A considerable proportion of the Iron sold during the past couple of weeks was taken by speculators, and will be held at furnaces until there is a market that it can be disposed of at a profit. This is bad for the furnacemen, as this Iron held on speculation is liable to be thrown upon the market at any time. In regard to the stock of Pig Iron in this district in first hands it is not large, and while, as already noted, the market is firmer there is no indication of any immediate boom, as there is a possibility that prices may advance somewhat within the next 30 or 60 days. We quote as follows:

Neutral Gray Forge	\$14.00 @	\$14.35, cash
All Ore Mill	15.00 @	15.50, "
White and Mottled	13.50 @	14.00, "
No. 1 Foundry	16.50 @	16.75, "
No. 2 Foundry	15.75 @	16.00, "
No. 3 Foundry	14.75 @	15.00, "
Charcoal Foundry	21.50 @	24.00, "
Cold Blast Charcoal	25.00 @	28.00, "
Bessemer Iron	17.00 @	17.25, "

Of the 3000 tons of Bessemer reported, 2500 tons were at \$17 cash, and 500 tons at \$17.25 cash—the former may be regarded as the ruling quotation.

Manufactured Iron.—The demand is more active, but with an increasing production prices are no better, and here is the great source of complaint; it is the unremunerative prices that annoy mill owners more than anything else. Some, for this reason, are indifferent about taking new business, and they are making no special effort with this end in view, and the chief object in starting up is to hold their trade, prevent their customers from buying from competitors, realizing as they do that once gone it may not be easy to get them back. We quote prices as a week ago, although it is probable that for very desirable orders Bar quotations are being shaded: 1.70¢ @ 1.80¢ for Bars; Plate Iron, 2.10¢ @ 2.20¢; No. 24 Sheet, 2.70¢ @ 2.80¢, all 60 days, 2 % off.

Muck Bar.—There is more doing, but no improvement in prices, which are regarded by makers as very unsatisfactory, \$26 @ \$26.50, cash. Sale of 1500 tons reported at the outside quotation. Even at the outside price it is claimed that there is little or no margin.

Nails.—There is no improvement to note in this market. Pittsburgh manufacturers are still refusing to sell below the card rate, \$1.90, 60 days, 2 % off for cash, in carlots, but as they are getting no orders it is evident that competitors at other points are selling for less. It is claimed that purchases can be made at \$1.90, delivered at Chicago, equal to about \$1.77 in Pittsburgh. Our manufacturers claim that even at full card rate the margin is small, and that rather than cut below they will not run their factories, and there are but very few Nail machines running here at present.

Wrought-Iron Pipe.—There is but little change to note in the general position of the market, with the exception that Boiler Tubes are firmer and higher; there are comparatively few mills that make Tubes, and this accounts for their having stiffened up while the balance of the list shows no improvement. Discounts may be quoted as follows: on Black Butt-Welded Pipe, 60 %; do., Galvanized, 55 %; Black Lap-Welded, 70 %; Galvanized do., 60 % off; Boiler Tubes, 65 % off; Casing, 35 % 3/4 foot, net; 2-inch Tubing, 11 1/4¢.

Old Rails.—There is an increased demand, caused by the starting up of the valley mills, where the consumption is always large, and the market is firmer. We can report a number of small sales at \$20.50 @ \$21, cash, mostly at \$21, which may be regarded as the ruling price. It is rumored that a valley mill bought a lot of 4000 tons at \$20.50, but thus far the rumor has not been confirmed. There have been no foreign Rails sold here for a long time.

Billets, &c.—Bessemer Steel Billets are still quotable at \$28 @ \$28.50, cash, as to size, quality and delivery. Nail Slabs, \$28.75 @ \$28; Domestic Rail Crops, \$17.25 @ \$17.50. Sale 500 tons Foreign Crops at \$23.50. Those making a specialty of Billets are pretty well sold up, and some of them are indifferent about making additional sales, especially for future delivery.

Steel Rails.—Heavy Sections are still quoted at \$31 @ 31.50, cash, at works, but it is intimated that a desirable order could probably be placed below prices quoted. There have been but few sales reported here recently, but the Edgar Thomson is still running full, working on orders booked some time ago.

Merchant Steel.—No new points have been developed. Business fair. Prices unchanged. Best brands of Tool Steel, 8½¢; Crucible Spring Steel, 4½¢; Crucible Machinery, 5¢; Open-Hearth Steel, 2½¢. As stated elsewhere, the works of Singer, Nimick & Co. are now being operated by non-union men.

Railway Track Supplies.—Prices are weak, and Spikes are lower, being quoted at 2¢, 30 days, delivered: Splice Bars are still quoted at 1.80¢ @ 1.85¢, and Track Bolts at 2.85¢ with square and 2.95¢ with Hexagon Nuts.

Old Material.—There is a rather better demand, but no improvement in prices: No. 1 (railway shop), at \$19, net ton; do., Track Scrap about \$1 less; Car Axles, \$22.50 @ \$23; Cast Scrap, \$14.50 @ \$15, gross; Cast Borings, \$11.50 @ \$12.

Detroit.

WILLIAM F. JARVIS & Co., under date of July 30, report as follows: A most forgotten state of Pig Iron matters seems about to present itself—viz., short supply in makers' hands in certain grades and a decided stiffening on these grades in consequence. The clouds really look as if they were rolling slowly by already. Some buyers are worried to know where they are going to get Iron at old prices, and it is safe to judge they will be more worried before they find the lots they are vainly searching for. Southern Forge Iron, for reasonably prompt delivery, cannot be obtained at any price, while futures would bring from 50¢ to \$1 a ton higher than the lowest 1888 prices to-day. Foundry grades, both Northern and Southern, are more scarce. The buying in all directions has been very large, and this, coupled with the fact of an increased number of stacks out of blast, has caused the very healthy stiffening, which is growing daily. Lake Superior Charcoal Pig is becoming also harder to obtain—smaller stocks on hand and large purchasing—but has not yet assumed its usual position in the van of the advancers. We are pleased to be able to report a strong, healthy market, with quotations firm, as follows:

Lake Superior Charcoal, all numbers	\$20.00 @ \$20.50
Lake Superior Coke, all ore	19.25 @ 19.75
Lake Superior Coke, cinder mixed	18.00 @ 18.50
Standard Ohio Black Band	19.25 @ 19.75
Southern Gray Forge	15.75 @ 16.25
Southern No. 2	17.75 @ 18.25
Southern Silvery	17.00 @ 17.50
Jackson County (Ohio) Silvery	18.50 @ 19.00
Old Wheels	19.00 @ 19.75

New York.

Office of *The Iron Age*, 66 and 68 Duane street.
NEW YORK, August 1, 1888.

American Pig.—A number of the local furnace agents report that deliveries are growing heavier, though it does not appear that this is an exceptionally favorable sign, in view of the fact that July is always very light. Low prices continue to be named, and often prove a source of embarrassment, because facts coupled with the quality of the Iron are not always fully stated or appreciated. There is considerable diversity of opinion concerning Virginia and Southern Irons, agents generally insisting that they have little for sale, and that only at full prices, while reports from other sections indicate a continuance of low figures. Thus \$16.25 has been named on No. 2 Southern at Sing Sing, and \$17.25 on No. 1 in Brooklyn. Mahoning Valley Iron continues to be offered at low prices throughout this territory. We hear of Cinder Mixed Northern Iron being offered at \$16.50 for No. 1, tidewater, this being cold short metal, which can be used only for a few special purposes. Standard to choice Northern Irons command, tidewater delivery, \$18 @ \$18.50 for No. 1 Foundry; \$16.50 @ \$17.50 for No. 2 Foundry, and \$15 @ \$16 for Gray Forge.

Scotch Iron.—Some importers claim to observe a slight stiffening, due to an advancing tendency abroad. We continue to quote: Coltness, \$19.50 @ \$19.75; Summerlee, \$19.25 @ \$19.50; Langloan, \$19 @ \$19.50; and Dalmellington, \$18.25 @ \$18.75.

Bar Iron.—The pressure from the West appears to be relaxing slightly, Mahoning Valley mills quoting an advance of \$1 ½¢ ton, which puts down Refined from that section here at 1.75¢. We quote for car-load lots, half extras, on dock, 1.60¢ @ 1.65¢ for Common; 1.65¢ @ 1.7¢ for Medium, and 1.75¢ @ 1.8¢ for Refined, with special qualities selling as high as 2¢ @ 2.5¢.

Plates.—Some of the mills decline to name the same prices at which former sales have been made before having been given the opportunity of closely studying specifications submitted. We continue to quote: Tank, 1.9¢ @ 2¢; Shell, 2.15¢ @ 2.30¢; Steel Tank, 2.3¢ @ 2.5¢; Shell, 2.4¢ @ 2.5¢; Flange, 3¢ @ 3.50¢, and Fire-Box, 3.25¢ @ 4½¢.

Structural Iron.—A moderate amount of business is being done, and one of the near-by mills reports that the quantity of Iron turned out during June and July was heavier than any month in its history. Consumers, while buying only from hand to mouth, insist upon a very prompt delivery. A number of Bridge orders have been placed, among them one calling for a 500-ton lot of Iron. We continue to quote: Bridge Plates, 1.9¢ @ 2¢; Universal Mill Plates, 2¢; Angles, 2¢ @ 2.2¢; Tees, 2.5¢ @ 2.7¢, and Channels and Beams, 3.3¢, on dock.

Steel Rails.—Sales during the week aggregate between 10,000 and 12,000 tons in the East, a block having been taken by one mill in Eastern Pennsylvania, which is reported to be an eager seller, partly of stock on hand. The greater part of the Rails sold have been for the South, only one small lot having been taken for Eastern delivery. Prices are on the basis of \$30 at tidewater, equivalent to \$29 @ \$29.25 at Eastern mill, which is now an open quotation. There is some business pending, but, on the whole, the outlook is not considered encouraging, in view of the low prices reached in the West, where, according to good authorities, \$30 has been accepted at Chicago. We note a sale of 30,000 tons by a mill in the Chicago district to the Winona and Southwestern Road, all but 6000 tons for next year's delivery. The

meeting of the Rail Association takes place at the West End Hotel, Long Branch, tomorrow (Thursday).

Old Rails.—There is more inquiry, and, on the whole, a better feeling. We note a sale of 1000 tons of Tees, reported to have been at \$21 on cars, Jersey City. There is some inquiry for Foreign Double Heads, the small stock of which is, however, firmly held considerably above the market.

Fastenings.—The temporary stoppage of a number of the mills has led to an improvement, Spikes selling at \$2.05, delivered, New York, which represents a slight advance. Among the sales we may note one of 15,000 kegs by one mill to another. There are a number of small inquiries on the market. In Angle Bars a better tone has also prevailed, 1.90¢, delivered being asked. Among the sales we note one lot of 800 tons.

Spiegeleisen and Ferro.—The market is entirely nominal. We quote 80 % Ferromanganese, \$49 @ \$49.50.

Billets and Slabs.—No business is reported, except a small lot of foreign Slabs at \$29, ex-ship, bought for re-export.

Wire Rods.—Occasional sales are being made on the basis of \$39.75 @ \$40. Foreign quotations are 104½, Continental shipping ports. Consumers here claim that in view of the wretched condition of the Wire and allied trades they cannot pay present prices for Rods. The prospective heavy grain movement holds out the hope of lower freights for later months.

Financial.

The view is more decidedly confirmed within the last fortnight or so that our leading crops, such as cotton and the cereals, promise a liberal field. At the same time there are indications that the European markets will receive a large proportion of our surplus at remunerative prices. Already this belief is quickening activity in mercantile circles. The reports from the United Kingdom are of bad crop weather and higher prices all round. In the New York grain and provision markets this week toward the close business has been unusually extensive. On Monday fully 18,000,000 bushels of the options were taken at an advance ranging as high as 4¢, and changes in spot stock were no less radical, with many orders to buy. In corn there was strong reaction. Reports from the grain fields say that winter wheat is threshing out better than was expected. The yield of oats, it is thought, will be the largest ever known. In southern Minnesota the harvested winter wheat shows a yield of 30 bushels per acre. The Nashville *American* states that "the wheat yield in Tennessee has probably never been so large as it is the present season. The crop is so unexpectedly heavy that we have the novel spectacle presented of inadequate storage room, vacant rooms in dwellings in many localities being utilized for the purpose." A dispatch from Fort Worth, Tex., says a carefully prepared crop report, covering 150 counties in Texas, shows the quality of wheat, corn, oats and cotton to be good. Wheat has harvested 95 % of an average. Corn will make 34 bushels per acre, which is 105 % of an average. The cotton acreage is 98 %. A New Orleans merchant writes that cotton, sugar and rice all promise better crops than last year, and that a brilliant prospect for trade is opening in all sections of the South. Another says merchants are buying more than usual at this time of the year. The State Board of Agriculture of Iowa issued a crop report July 23, in which they place the condition of corn at 100 %; winter wheat, 95½; spring wheat, 86. Per contra, the State Board of Agriculture of Indiana report that the

wheat crop in the southern part of the State is a little less than an average. Corn averages 115 ¢, against 85 ¢ for the last four years. An Ottawa dispatch says Manitoba will have 15,000,000 bushels for export, 25 ¢ more than last year. Perhaps the most hopeful feature of the week was the decision of Judge Brewer that the acts of a State Railroad Commission might properly be inquired into by the courts and made to conform to reason and equity. The iron situation is better, and the tariff is less threatening. The cable war was finally settled on Monday, when the officials of the different companies signed the agreement raising the rate from 12½¢ to 25¢ a word, and making the press rate 10¢ a word instead of 6¢.

The Stock Exchange market on Thursday received an impetus from the announcement of Judge Brewer's decision sustaining the preliminary injunction against the Iowa Commission, which was construed as favorable to the grangers. The State Legislature cannot delegate powers to determine rates under his rulings. A better feeling abroad toward American securities was attributed to the same cause. The coalers were stronger during the week on account of reports of a better business in coal transportation.

United States bonds are quoted as follows:

U. S. 4½s, 1891, registered	107¾
U. S. 4½s, 1891, coupon	107¾
U. S. 4s, 1907, registered	127¾
U. S. 4s, 1907, coupon	127¾
U. S. currency 6s	120

The total bonds purchased by the Treasury Department under the circular of April 17th last are as follows: Amount purchased, 4 per cents, \$18,735,500; amount purchased, 4½s, \$8,942,300. Total, \$37,677,800. Cost, 4 per cents, \$23,794,600.58; cost 4½s, \$9,628,678.45. Total \$33,423,279.03.

It is reported that Gen. Roger A. Pryor has been appointed by Governor Hill special counsel for the civil prosecution of the trust corporations. The actions are to be commenced in the Supreme Court of this county, and involve a forfeiture of franchise. In Congress, the House Committee on Manufactures submitted their report concerning the trust investigation, to the effect that the usual form of combinations was devised for the purpose of placing monopolies beyond the reach of existing statutes.

The bank return for the week shows an increase of \$675,775 in surplus reserve, which now stands at \$27,116,175, comparing very favorably with its position one year ago, when the excess was about \$8,000,000. The loans were contracted \$141,900; the specie decreased \$362,200; the deposits other than United States decreased \$2,207,500. Time loans being no longer in favor with institutions generally, funds are being made available for contingencies in case there should be a heavy demand to aid in moving the crops, which is likely soon to occur. Already there is a perceptible hardening at Western points. At Chicago the rate of exchange is down to 25 cents discount, and at St. Louis is at 25 cents premium. It is assumed that the Treasury will readily reduce its surplus by the purchase of bonds or through the depositary banks should occasion arise. The large dry goods failure of last week is followed by that of J. & C. Johnston, on Broadway and Fifth avenue, who are short of cash. The firm obtained an extension upon \$60,000 indebtedness, payable in October. The stock of Levi M. Bates was sold by the Sheriff, at rates fairly good. The market for sterling was weak, and posted rates were reduced to \$4.86 for 60 days' and \$4.88½ for demand. The London *Economist*, of July 21, says: "As regard the shipments of gold from the United States, the probability is that they cannot be continued. No doubt

the monetary position of the States is distinctly more favorable than it was at this time last year. The Secretary of the Treasury has now been armed with power to buy Government bonds at a premium in order to prevent the accumulation of surplus revenue in the Treasury, and there is no doubt that this power will be freely exercised if necessary. Even under the most favorable conditions that now obtain in the money market it seems much more likely that the States will have to take gold from this side than that they will continue to send the metal here."

The clearings of 38 cities last week were \$818,625,687, a decrease of 4.6 ¢ as compared with the previous year. Outside of New York the clearings were \$309,237,908, an increase of 0.9 ¢. New York decreased 7.6. In Denver, Omaha, Minneapolis, St. Joseph, Milwaukee and other points in the Northwest there were heavy gains.

The imports of merchandise at this port during the week were large, amounting to \$9,743,000, of which over \$3,000,000 represents dry goods. Since January 1 the total is \$276,414,500, as compared with \$272,395,500 for the same time last year and \$250,326,570 in 1886.

According to the Custom House report the exports of specie from New York last week amounted to \$241,000, and the imports were \$82,000. Since January 1 the exports are \$25,345,800 and the imports \$5,623,500.

It has been determined by the Baltimore and Ohio authorities to immediately complete the connection between their Philadelphia extension and Staten Island via Roselle, on the New Jersey Central.

Metal Market.

Copper.—Opening during the week under review at £81. 5/, spot, Chili Bars wound up in the London market yesterday at £80. 12/6, futures meanwhile going way from £78. 10/ to £70. 15/, the total sales amounting to 200 tons and no more. Here a pool sale is understood to have perfected at 16½¢ for four months, but the exact quantity taken we have been unable to ascertain. It is stated by some that the amount is not large and indicates a falling off in consumption; others on the contrary assert that the Copper has been taken freely. On 'Change the market has been dull and flat, Spot bringing 16½¢ and January 16½¢. Yesterday the nominal quotations were, for spot and August, 16.75¢ @ 16.70¢; September, 16.75¢ @ 16.60¢; and the later months of the year, 16½¢. On July 30 the Calumet and Hecla began hoisting rock from No. 3 Calumet Shaft, making two shafts of the main mine now producing. London arrives 5/ lower this morning with both spot and futures. Good ordinary brands are £73. 5/, and Best Selected £75. 10/. Import of American Copper into Liverpool and Swansea, January 1 to July 16, 15,206 tons Fine, against 5376 tons same time last year. The position and future of the syndicate have led to a great deal of discussion in the papers and circulars, in Europe, and even in pamphlet shape, one of which we review in another column. Messrs. James Lewis & Son, Liverpool, in their circular of July 16 express themselves as follows: "A considerable number of transactions have taken place during the fortnight in Good Merchantable Copper, which includes English Best Select Ingot and Tough Cake; Lake Superior, Oxford and Baltimore Ingots; Wallaroo and Burra Cakes or Ingots; Arizona Pigs of 96 ¢ Cornish assay or over; Lata and Urmeneta Ingots; Japanese Tiles and Chili Bars of 96 ¢ or over. As a sub-committee of the London Metal Exchange has been appointed to frame a form of contract for

Good Merchantable Copper this speculative medium is now practically recognized and will to a considerable extent supplant the business hitherto carried on in Chili Bars. While benefitting foreign smelters of Copper, whose produce has hitherto been very slow and difficult of sale and will now be readily salable, this new departure will, we anticipate, prove very detrimental to the established English smelters, as it will considerably reduce the volume of their business and enable smelting to be carried on in this country with very much less capital than heretofore, thereby inducing increased competition. Much is being said and written as to the probability of an early collapse of the French speculation in Copper. In view of the disastrous results that would at present follow from this—not only to the operators themselves, but also to their guarantors—we do not think it is at all likely to take place, when it is considered that the quantity of Copper now in stock, contracted for and still undelivered must amount to fully 500,000 tons, at an average price of about £85 ½ ton, in addition to about 50,000 tons of Chili Bars in stock and to arrive, costing over £70 ½ ton, and that the abandonment of the speculation now would involve a loss on this of probably £35 and £40 ½ ton respectively. It must be borne in mind that each month the liabilities of the French operators decrease, as part of the Copper contracted for or purchased by them is delivered to consumers and a profit realized upon it. No doubt the quantity of Copper taken by consumers has proved very disappointing to those interested in the speculation, and their unsold stocks have increased to a much greater extent than they anticipated, but consumers must after awhile come to their assistance and take good part, though we do not think they will take all of the Copper arriving. By the end of the year the Copper to be carried will probably amount to over 100,000 tons, but as it is the mutual interest of the French speculators and also of producers that the value of this metal should not fall to a point that would leave a loss on its production and entirely stop the payment of dividends by the different mining companies, the latter may be induced after awhile to diminish their output to an extent sufficient to prevent further accumulation of stocks." A correspondent of the Hamburg *Börsen-halle* dwells on the fact that, at the high prices ruling, the consumption of sheathing Copper for vessels has stopped altogether; that, on the contrary, vessels at present furnish more old Copper, which is sold and the vessels leave unsheathed. Iron vessels being so cheap, vessels using a Copper bottom are hardly built any more in Europe. The correspondent goes on in the same strain, proving the falling off of the Copper demand in other directions, while the supply increases. Matters would be different, he says, if, instead of £80, the syndicate had fixed the rate at £60, at which consumption would not have abated perceptibly in all likelihood. Rio Tinto shares have been actively dealt in on the Paris Stock Exchange last week at 19¼ @ 20½ francs.

Tin.—On Thursday of last week the London quotation for spot Tin was £87. 15/, and futures stood £88. 15/; yesterday the former had advanced to £89 and the latter to £89. 10/; total sales, 405 tons. Our own market followed suit, but lacked buoyancy, there being little disposition to operate at the advance, the jobbing demand at the same time being moderate. Sales were made of 145 tons, spot at 20¢; August at 19.90¢; September at 20¢, and October at 19½¢. This morning London comes 5/ lower with both stock and futures. The spot stock in England, Hol-

land and America to-day is 10,023 tons, against 12,697 on July 1, 1888, and 5548 on August 1, 1887. **Tin Plates.**—The demand has continued steady; stocks continue light, and prices are fully sustained at following quotations for large lines on the spot: Siemens-Martin Steel, Charcoal finish, \$4.85 @ \$5.25; ditto Coke finish, \$4.75; Terns, \$4.30 @ \$4.40; Bessemer Cokes, \$4.45 @ \$4.60, and Wasters, \$4.20 @ \$4.25. Coke Tins are selling at 13/3 in Liverpool, for prompt delivery.

Lead.—There being little Lead available in second hands the scarcity of spot caused the market to harden, and the trifling purchases made by consumers, in all about 300 tons, had to be satisfied at a higher range, beginning at 3.95¢ and ending at 4.12½¢, as much as 4.15¢ having been paid, but the actual spot market value to consumers being 4¢ at the close. The chief operator has been pushing prices, and some 700 tons changed hands on the Metal Exchange, August and September at 4¼¢ @ 4.17½¢. St. Louis quotes 3.90¢, and Chicago 3.95¢ @ 4¢. In London Soft Spanish has not served from £13, while English Pig gave way from £13. 7/6 to £13. 5/. At the Metal Exchange to-day 400 tons August, September and October were sold at 4.17½¢, the last sale being 50 tons August at 4.15¢. Stocks of Lead in Spain are large still, and it is doubtful whether makers over there can agree to reduce production from now forward.

Spelter.—The market for ordinary brands of Domestic has been looking up in consequence of higher prices insisted upon by makers out West, and some business has been transacted at 4¼¢, while Silesian remains 5¢, there being a decline in London from £16. 2/6 to £16. Advises by mail from Silesia state that production latterly declined a little, the yield not being as good as it was previously.

Antimony.—Has been moving off regularly in a jobbing way at 9¼¢ Hallett, and 13¼¢ Cookson.

New York Metal Exchange.

The following sales are reported:

THURSDAY, JULY 26.	
10 tons Tin, September.....	19.00¢
32 tons Lead, spot.....	3.87½¢
48 tons Lead, August, seller's right to double.....	3.90¢
50,000 lb Balto. Copper.....	15.25¢
FRIDAY, JULY 27.	
100 tons Lead, July.....	3.90¢
16 tons Lead, July.....	3.92½¢
16 tons Lead, December.....	4.00¢
MONDAY, JULY 30.	
10 tons Tin, spot.....	20.00¢
10 tons Tin, September.....	20.00¢
25,000 lb Copper, January.....	16.25¢
48 tons Lead, September.....	4¼¢
TUESDAY, JULY 31.	
10 tons Tin, August.....	19.90¢
25 tons Tin, October.....	19.50¢
25,000 lb Copper, spot.....	16.75¢
WEDNESDAY, AUGUST 1.	
50 tons Lead, spot.....	4.25¢
132 tons Lead, August.....	4.17½¢
97 tons Lead, September.....	4.17½¢
49 tons Lead, October.....	4.17½¢
81 tons Lead, August.....	4.15¢

Coal Market.

The Anthracite Coal trade is reported as occupying a stronger position. The deliveries under orders given prior to the advance being now quite active, while the wholesale dealers, it is said, refuse new applications at anything below the net circular prices last promulgated. Transactions at the latest advance, however, are as yet comparatively limited. As a whole, the business done in July is said to have exceeded that of any corresponding month on the record, thus reflecting the improved industrial situation, especially so far as relates to the manufacture of Iron. The quantity of coal forwarded to market

during the last few days, as appears from the statistics given below, is not quite so large, at least so far as concerns the Lehigh and Reading districts. Judging from indications the chief operators are well satisfied both with the position and prospects, and as to prices and railroad tolls are content to let "well enough" alone. The several conferences held during the past week having brought about no change in any respect. The promise now is for a steady business during the remainder of the season. The possibility of an advance September 1 is intimated, but of this nothing definite can be said until a contemplated meeting of sales agents, August 15. The Western demand is heavy, but is embarrassed by a lack of transportation facilities. At loading ports vessels have to wait their turn. Freight to Boston are about 85¢ from New York and 90¢ from Philadelphia.

Hard coal rates from Chicago to northwestern points have been advanced to \$3.50 per ton, the highest rate ever in effect.

The Anthracite Coal production for the week ended July 28 shows a shortening up compared with the previous week, the total being 824,836 tons, a decrease of 62,500 tons, but for the year to date there is an increase of 255,000 tons, the aggregate from all the mines since January 1 having been 19,608,883, as against 19,353,000 for the same time in 1887. The heaviest receipts of Coal are from the Wyoming region, which shows a growing proportion, amounting last week to nearly 500,000 tons. Quotations are as follows: Wyoming Free Burning, f.o.b. at South Amboy and Weehawken, Broken or Grate, \$3.85; Egg, \$4.15; Stove and Chestnut, \$4.50; Reading Hard White Ash, Chestnut, \$4.40; Stove, \$4.50; Egg, \$4.25, and Broken, \$4.10. The small steam sizes can be bought as low as \$2.40, and Buckwheat, \$2 @ \$2.10 f.o.b.

Bituminous Coal is quiet at \$3.25 per ton, f.o.b. The Cumberland and Clearfield product last week was 125,000 tons, which is a slight increase compared with last year. Since January 1 the total is 3,859,418 tons, an increase of 230,000 tons compared with 1887. It is reported from Philadelphia that the New Jersey Central Railroad has purchased a controlling interest in the Lehigh and Hudson River Railroad, which it will use to aid it in reaching the Poughkeepsie Bridge. Joseph S. Harris, who is vice-president of the Jersey Central, is also president of the Lehigh Valley Coal and Navigation Company, which is under contract with the Lehigh and Hudson River Company to ship a large amount of coal over its road annually.

Old Metals, Rags, &c.

British Iron and Metal Markets.

[Special Cable Dispatch to The Iron Age.]

LONDON, WEDNESDAY, August 1, 1888.

The Copper market, while displaying no remarkable activity, has developed more pronounced firmness. Consumers have purchased to a fair extent, and an increased demand has sprung up for cash "warrants." This demand comes mainly from parties who sold three months' futures "short" some time ago, the deliveries on which fall due August 1 and September 1. As in previous months since the syndicate had control, "cash" are found to be scarce just at the time they are most wanted, and the syndicate relieves the scarcity only when the "shorts" bid prices up high enough to make it an object for them to let a few "warrants" out. Hence the gradual rise on prompts from £79. 10/ to £81, while futures have advanced to a very moderate extent only. There have been further large transfers of Chili Bars from Liverpool to France, thus placing supplies more closely than before under complete control of the syndicate and its allies. Business under the new form of contracts, on which Good Merchant Brands are a good delivery, is exceeding that doing in Chili Bars. It is estimated that fully 750 tons have been turned on the new form since the innovation went into force, and syndicate brokers have been most conspicuous among the buyers. Arizona Pig has changed hands to a considerable extent at an average of about £73 during the past week.

Speculation in Pig Tin has been only moderately active, but the transactions in this form, together with quite extensive purchases by consumers, make up a large total business. The dealings have extended through all positions—prompt, 30 days, 60 days and three months' future deliveries—imparting considerable strength to the market. Prices have reacted somewhat the past few days under realizations by speculative holders.

There has been a sharp demand for Bessemer Steel Tin Plates, the spot supply of which is now very light, and the near future output well under the control of orders. Other Coke Plates are also in very good position. This fact coupled with the advance on Pig Tin and reported large orders from the American market causes makers to hold off for still higher prices. An advance has been paid for certain favored brands. Views taken on the American tariff bill have caused considerable stir in the trade, and preparations are said to be making for a larger business. It is stated that prominent parties are selecting sites for new mills and also in treaty with owners of idle works to engage in the manufacture of Plates.

The several branches of the Pig Iron market have continued strong and a further advance in prices all along the line has taken place. The improved statistical position in the Middlesboro' district has been a prominent factor, but a better demand for Scotch and Bessemer Pig has helped to change sentiment and caused heavy buying of "warrants" by brokers to cover recent "short" sales. There seems to be a more or less general belief that prices have touched the lowest point that will be recorded for this year.

The Steel mills in most localities are very busy in nearly all departments on back orders, and new business is coming in to a very encouraging extent in several branches. In fact, the conditions are such that values show a hardening tendency nearly all through.

The demand from Italy for Old Iron Rails seems to have completely died out, and the market for Old Material in general is now decidedly flat.

The average price in the North of England for manufactured Iron the past two months is officially reported as £4. 13/11.

Another new furnace is being erected by the Lynvitondu Works.

Scotch Pig.—Firm market with fairly active demand:

No. 1 Coltness, f.o.b. Glasgow	43
No. 1 Summerlee, " "	47 6
No. 1 Gartsherrie, " "	44 6
No. 1 Langloan, " "	44 6
No. 1 Cambro, " "	39 6
No. 1 Rhotts, " at Leith	45
No. 1 Gtengarnock, " Ardrossan	43 6
No. 1 Dalmeilington, " "	40 6
No. 1 Eglinton, " "	39 9
Steamer freights, Glasgow to New York,	
5; Liverpool to New York	7/6.

Cleveland Pig.—Continues strong and selling freely at the advance. No. 1 Middlesboro', G.M.B., 35/6; No. 3 do., 33/.

Bessemer Pig.—Good demand and prices strong. West Coast brands, mixed numbers, 43/ @ 43/6, f.o.b. shipping point.

Spiegeleisen.—Firm market with the demand fair. English 20 % quoted 80/, f.o.b. N. W. England shipping point.

Steel Rails.—Demand still fairly active and prices steady. Standard sections quoted at £3. 17/6, f.o.b. at N. W. England shipping point. Middlesboro' district 2/6 less.

Steel Blooms.—Market quiet but steady. We quote at £3. 12/6 @ £3. 13/ for 7 x 7, f.o.b. at N. W. England shipping point.

Steel Billets.—A fairly good trade at steady prices. Bessemer, 2½ x 2½ inch, £3. 17/6 @ £3. 18/3, f.o.b. at N. W. England shipping point.

Steel Slabs.—Not much doing, but prices steady. Bessemer, £3. 16/3, f.o.b. at N. W. England shipping point.

Steel Wire Rods.—The demand moderate and prices barely steady. Mild Steel No. 6 quoted at £5. 12/6 and No. 5 at £5. 10/, f.o.b. at N. W. England shipping point.

Old Rails.—Very little demand; prices nominal. Tees quoted at £2. 15/, and Double Heads £2. 17/6, c.i.f., New York.

Scrap Iron.—Slow market; prices rather weak. Heavy Wrought quoted at £2. 5/, f.o.b.

Crop Ends.—Market quiet and unchanged. Bessemer quoted £2. 5/ @ £2. 7/6, f.o.b.

Tin Plate.—A good demand, particularly for Cokes, and the market firm. We quote, f.o.b. Liverpool:

1C Charcoal, Allaway grade	14/6 @ 15/
1C Bessemer steel, Coke finish	13/ @ 13/3
1C Siemens	13/3 @ 13/6
1C Coke, B. V. grade	13/ @ 13/3
Charcoal Terne, Dean grade	12/6 @ 12/9

Manufactured Iron.—There is a very fair business at steady prices. We quote, f.o.b. Liverpool:

Staff, Ord. Marked Bars	£ s. d. @ 7 10 0
" Common	4 17 6 @ 5 0 0
" 11½ Sheet, singles	@ 6 15 0
Welsh Bars (f.o.b. Wales)	4 12 6 @ 4 15 0

Tin.—Fairly active market, with undertone firm. Straits quoted at £88. 12/6 @ £88. 15/, spot, and £89 @ £89. 5/ for three months' futures.

Copper.—A good business doing, mainly speculative. Market firm. Chili Bars closed at £80. 5/ @ £80. 10/, spot, and £77. 10/ @ £78 three months' futures. Best Selected, £75 @ £75. 10/.

Lead.—Less active demand, and market not so firm. Soft Spanish, £13 @ £13. 5/ at the close.

Spelter.—A fair business at steady prices. Silesian, ordinary, £16 @ £16. 2/6 at the close.

Cost of Crushing Magnetite.

In a paper read by Theodore A. Blake, of New Haven, Conn., before the American Institute of Mining Engineers, the following results are given as having been secured by Blake multiple-jaw crushers and coupling jigs at the new mill of the Chateaugay Ore and Iron Company, at Lyon Mountain, N. Y., on magnetite crushing down to ¼-inch size for separators. The actual amount crushed from September 26, 1886, to January 1, 1888, was 122,814 long tons or 137,551 short tons, at a cost for crushing and concentration of \$42,200.55; or 34.36 cents per long ton, or 30.67 cents per short ton, distributed as follows:

	Total.	Per gross tons.
2018 1836-2240 tons of coal	\$8,612.37	\$0.07
Labor	21,000.72	.17
Oil waste, &c.	2,374.30	.02
Mill supplies, renewals, and repairs	10,205.16	.08
Total	\$42,200.55	\$0.34

This economy is certainly remarkable, and still more so when we consider the prevailing unfavorable conditions as regards successful screening of the ore. Had the ore been reasonably dry instead of being generally wet and, during the winter months, frozen, or if the crushing after the passage of the 30 x 5 crushers had been "wet" instead of dry and the screening in that way made perfect as it can be, the actual average daily product could have been increased, even doubled, and the cost of crushing and concentrating per ton of crude ore reduced to less than 25 cents.

Filtration of Waste Oil.

Referring to the filtration of waste oil, *Engineering* remarks: The exact nature of the functions exercised by molecules of oil in lubricating surfaces, like many other physical questions, merely leads to hypotheses, without any exact solution which determines what is lubrication. From extended experiments and observations upon the subject, the conclusion has been arrived at that oil in lubricators never "wears out." Its lubricating properties are impaired by holding dust and metal in suspension, by volatilization of the more fluid portions, and by oxidation, but the remaining portion of the oil still performs its original function. The lack of knowledge on the subject of lubrication pertains to how to use oil rather than what oil to use. The separation of oil dripping from heavy journals is easily performed by filtration through a cask of sand or charcoal, with a piece of cloth at the top to remove the coarser impurities. If the lard or sperm oil used has "gummed" to a considerable extent, an admixture of mineral lubricating oil will dissolve much of the thick material, and improve the character of the filtrate as a lubricant.

The fluidity of oil is so much greater at high temperatures that this process is much more satisfactorily accomplished at a temperature of 100° F., and a steam coil may be used to advantage, or the filter may be placed in some warm place; in either case the hazard of fire from spontaneous ignition or from the inflammable vapors arising from the oil must be guarded against by carrying on the work in some cheap shed or suitable place where fire would not result in disastrous consequences. Oil is removed from metal turnings by means of a centrifugal extractor which is surrounded by a steam jacket, and the oil thrown out by the extractor is ready for use on cutting tools, but should be filtered before being used for lubrication. The first centrifugal extractor was designed for the purpose of separating syrup from granulated sugar in the process of sugar manufacture, but to the disappointment of the inventor its use was satisfactory only for a few minutes, after which the syrup would gum upon the perforations in the sides of the revolving cylinder, and prevent its further operation. Numerous experiments in the way of scrapers and other mechanical devices did not remove the difficulty, until a bystander casually remarked that a jet of steam would allow the syrup to flow continuously, and this suggestion led the way to successful operation of the machine.

Electric Carbon Filaments.

Some interesting observations relative to the carbon filaments of incandescent lamps have recently been made. In testing chemically certain filaments said to be of a material other than carbon, Mr. Desmond G. Fitz-Gerald boiled them in strong sulphuric acid, with the view, if carbon were present, of obtaining carbonic oxide and sulphurous acid according to the reaction $H_2SO_4 \times C = CO \times H_2SO_3$. No such reaction occurred, the filaments in question remaining unaltered. Before committing himself, however, to the conclusion that no carbon was present, the experimenter took the precaution of repeating the experiment with filaments known to be of carbon. These filaments also remained unaltered after prolonged boiling in the acid. The result justifies the conclusion that the carbon of the lamp filaments, unlike ordinary carbon, is not acted upon by sulphuric acid at its boiling point. The *Electrical Engineer* says: "It confirms also the conclusion arrived at by Mr. Anthony, that the molecular constitution of a filament of carbon, obtained by heating to a redness a filament of organic matter, becomes modified when the material is subjected for a certain period of time to the comparatively high temperatures obtained by its incandescence as a lamp filament. Mr. Anthony found that this molecular change is indicated by an increase in specific resistance of the carbon. Operating with a new filament, he observed that a diminution in its resistance occurred at a comparatively low temperature, and that the resistance steadily diminished as the temperature was augmented. But after the filament had been allowed to cool, its initial resistance was found to have been augmented. The same fact has been observed by other investigators; but one of Mr. Anthony's results is probably altogether novel. Operating with certain incandescent lamps taking currents of six, eight and ten amperes, and giving luminous intensities of 32, 65 and 125 candles, he found that the resistances of the filaments had appreciably diminished after the lamps had been working for from 200 to 300 hours and that subsequently the resistance steadily increased up to a certain point as the working was continued."

Hardware.

The general tone of the market is rather unsatisfactory, and prices are not regarded as very firm. This impression is strengthened by the fact that there are at the present time several lines of goods the price of which has recently fallen away to a greater or less extent. Buyers are accordingly rather cautious about placing their orders, showing a disposition to hold off, with a view to ascertaining whether or not there are to be further declines. With this exception the condition is regarded as promising well, the general prosperity of the country, the expectation of fine crops and increased activity in some lines, with an improved demand for Hardware, giving promise of a good fall trade. In the opinion of some well-informed parties, prices are likely soon to recover somewhat in tone, and the opinion is expressed that in some lines which are now low and irregular, those who defer purchasing will very likely have to pay something of an advance on present quotations.

Cut Nails.

The New York market remains in the same condition, good brands selling in carload lots at \$1.90 to \$1.95, while outside lots are occasionally offered at concessions. Small lots from store command \$1.95 to \$2. Reports from the West indicate that the proposed Nail pool had suffered a set-back there a week ago, but that now prospects have improved. A meeting of the Western Nail makers is to be held between the 15th and the 20th of the current month. There is little hope that the Eastern makers will enter any arrangement for the present.

Wire Nails.

To-day a new Wire Nail pool goes into effect, to which, it is reported, the leading mills are parties. It is of special interest, since the basis differs radically from the usual method of such associations. In its general outline it is as follows: Monthly reports are made of the quantities sold and the prices realized by each mill. Those who have sold below a fixed standard price pay into the Association a sum equal to the difference in the price realized on the quantity marketed, and the sum which the sales would have fetched at the standard price. The amount thus collected is distributed *pro rata* of sales among the members. Let it be assumed, to illustrate this arrangement, that the standard price is \$2.50, and that six mills have made the following report:

Mill.	Sales.	Price.	Realized
A.....	20,000	\$2.25	\$45.00
B.....	15,000	2.30	39,500
C.....	20,000	2.40	48,000
D.....	25,000	2.50	62,500
E.....	10,000	2.60	26,000
F.....	10,000	2.75	27,500
Total.....	100,000		\$248,500

Under the arrangement A would have to pay \$5000; B, \$3000, and C, \$2000, a total of \$10,000. Redistributing, the result would be:

A.....	\$45,000 - \$5,000 + \$2,000 =	\$42,000
B.....	39,500 - 3,000 + 1,500 =	38,000
C.....	48,000 - 2,000 + 2,000 =	48,000
D.....	62,500 + 2,500 =	65,000
E.....	26,000 + 1,000 =	27,000
F.....	27,500 + 1,000 =	28,500
		\$248,500

It will be seen that the low sellers would not alone suffer from reduced revenue, but would have to be content to have their income cut down still further by paying penalties larger than their share of the sums so collected, while those who hold out for high prices get a bonus besides.

Barb Wire.

The market continues without marked change, but prices on large lots are slightly shaded, while the nominal quotations re-

main as before. The market has been characterized by the dullness usual at this season, but we are now advised of some signs of increased activity.

Washburn & Moen Mfg. Company and I. L. Ellwood & Co., under date July 14, have issued a circular relating to Barb Wire litigation, explaining the recent withdrawal of their application for a temporary injunction against the Braddock Wire Company, to which we have heretofore referred, and stating that the litigation will be earnestly prosecuted.

Miscellaneous Prices.

Coes Wrench Company, Worcester, Mass., issue a price list and circular of their L. Coes's Patent Knife Handle and Mechanics' Wrenches, in which the special features of these goods are alluded to and *fac similes* of their labels given in color. Referring to this line of goods the following joint announcement as to prices and terms is made by the agents, J. C. McCarty & Co., 97 Chambers street, New York, and John H. Graham & Co., 113 Chambers street, New York:

To the Trade: The consolidation and incorporation of Messrs. L. Coes & Co. and A. G. Coes & Co., of Worcester, Mass., under the title of the Coes Wrench Company, renders it necessary for the subscribers to issue a joint circular instead of separately, as heretofore. We are instructed by the new corporation to quote the following prices—viz.: L. Coes & Co.'s Knife Handle Wrench as well as A. G. Coes & Co.'s make, 55 per cent. discount from list.

A special discount of 10 per cent. will be allowed on specified orders for 50 dozen for immediate shipment.

Mechanics' Wrenches will continue to rate at 10 per cent. less than the Genuine, and are subject to same quantity schedule.

Terms 90 days, or 3 per cent. cash 10 days.

Parties having purchased the quantity will be entitled to the extra discount on subsequent orders during the balance of the season ending December 31, 1888.

As both L. Coes & Co.'s Knife Handled Wrench and A. G. Coes & Co.'s pattern are made by the same company the trade can obtain either style from either of the agencies as above. For the convenience of the trade the Coes Wrench Company in their circular state the opening capacity of each size Wrench and contents of cases as follows:

Size Wrench..... 4 6 8 10 12 15 18 21 in.
Will open..... 1 1/4 1 3/4 1 1/2 2 1/4 2 3/4 3 1/4 in.
Cases contain..... 6 6 6 6 6 6 6 2 1 doz.

Eagle Carriage Bolts are irregular and considerably lower prices than recently prevailed are now being made.

The competition of outside makers of Horse, Curry and other Cards is more formidable than it has heretofore been, and somewhat lower prices are ruling.

The market for Rope is characterized by exceptional firmness and an advance of 1/2 cent has been made in Manila, while Sisal is held very firmly at ruling prices.

The improved condition of things in Wrought-Iron Pipe, to which we have heretofore referred, still continues, and, while there has been no advance in price, quotations are firmly maintained, and manufacturers are less disposed than formerly to make concessions.

Manufacturers of Squares have advanced the price of No. 1 Iron from \$6 to \$8 per dozen. The discounts which they are making are, however, without improvement, the tendency being apparently toward slightly lower prices. In this line of goods the market is in a decidedly unsatisfactory condition.

The following are the prices in dozen lots of the Peabody Door Spring, described on page 57, and put on the market by A. W. Paine, Peabody, Mass., special prices being made on gross lots.:

	Per gross.
No. 1 for Screen and House Doors.....	\$15
No. 2 for Store Doors.....	18

The Postal Package Company, 34 South Paca street, Baltimore, Md., advise us that the price of their Torches, illustrated on page 185, without sticks or wicks, is \$150 per 1000, with a trade quantity discount.

The following are the list prices of J. F. Wollensak's Lever Latch and Handle, put on the market by J. F. Wollensak, Chicago, Ill. A description of this article was given in our last issue. The list given is subject to a discount of 40 per cent.:

	Per dozen.
No. 102 Polished Brass.....	\$21
No. 102 x 1/2 Nickel Plated Brass.....	24
No. 0102 Japanned Malleable Iron.....	9

There appears to be some uncertainty in regard to some of the list prices on Emery Wheels, as adopted by the Association, some changes having been made or suggested since the meeting of the manufacturers.

Ammunition.

The general situation remains without substantial change, with increasing probability, however, that something will be attempted before long with a view to correcting existing irregularities. While we are advised that the E. C. Meacham Arms Company have not made formal application to the association to be reinstated, they have undoubtedly expressed to influential parties closely connected with the association their desire to be restored to their former position. Whether or not this will be considered feasible or desirable is a question, but the large trade would welcome any action on the part of the association to relieve the situation of its uncertainty and irregularity in prices. The extent to which concessions contrary to the scheme of the association are made by the Special and "A" houses, thus making it feasible for many outside parties to obtain their goods on as favorable terms as if in contract with the association, while they are free to sell at any terms they please, a liberty which they often use to advantage in the conduct of their business, is the real difficulty in the situation. The opinion seems to gain ground among well-informed parties that some recasting of the existing scheme is not improbable, and it is possible that the association may sooner or later take action, by which the large trade will not be given so complete a protection in margins of profit as the present scheme, in too many cases unsuccessfully, endeavors to secure them.

The Alford & Berkele Company,

77 Chambers street, New York, call attention to their specialties in Firearms as follows: Remington's New Line Revolvers, manufactured by E. Remington & Sons; Remington's System Breech-Loading Shotguns, manufactured by Whitney Arms Company; Unique Automatic Revolvers, manufactured by C. S. Shattuck, and Sterling American Bulldogs, manufactured by E. L. Dickinson expressly and exclusively for them. They are also agents for the American Buckle and Cartridge Company, manufacturers of Paper and Shot Shells, and the American Gun Implement Company, manufacturers of Breech-Loading Gun Implements, Fowler's Patent Glass Shells, &c. The following quotations on their specialties in Firearms will be of interest:

Remington No. 3 (Smooth's Patent) Latest Model, New Line.—Octagon Barrel Fluted Cylinder, Patent Shell Ejector, Checkered Rubber Stock, Saw Handle, Flat Butt, five shots; 38 Cal. S. & W. C. F., or 32 S. R. F., 3 3/4-inch Barrel; weight, 1 pound. Prices: Nickeled, \$3.50; Nickeled, Engraved, \$4.50; Nickeled, Ivory, \$4.50; Nickeled, Pearl, \$5; Nickeled, Ivory Engraved, \$5.50; Nickeled, Pearl Engraved, \$6.

Nos. 1 and 2 Wrought Steel Frame and Barrel in one piece. In all other respects like the above, except in the shape of Stock, and the Calibers, of which No. 1 has 30 Cal., No. 2, 32 Cal. Both rim fire. Prices: No. 1, \$2.25; No. 2, \$2.75; Extra for Ivory Stock, 75 cents;

Extra for Pearl Stock, \$1.13; Extra for Engraving, \$1.

Sterling American Bull Dog.—Double action or self-cocking. Weight, 16 ounces; Center fire; five shot; Rubber Stock. Long Fluted Cylinder, Saw Handle, Octagon Barrel, 3½-inch Barrel only; No. 832, 32 Caliber, \$1.65.

Shattuck's "Unique" Revolvers.—Thirty-two Caliber; center fire; Rubber Stock, Saw Handle, Octagon Barrel, Fluted Cylinder, Swing-Out Cylinders, price \$1.75.

S. & W. Model Revolvers—"K. of L."—Thirty-eight Caliber, five shots, Double Action, Safety Hammer, Center Fire, Rubber Saw-Handle Stock, Fluted Cylinder, \$1.75.

British Bull Dog—Rebounding Hammer.—"S. & W." C. F. Cartridge, Full Nicked Rubber Stock, All Steel, seven and six shots. Length of Barrel, 2¼ inches; full length, 6 inches; weight, 16 ounces, \$1.50. "Ryan's" New Model Ribbed S. & W. Model Barrel, 32 and 38, \$1.65.

No. 4 New Model Remington.—Round Barrel, Fluted Cylinder, Checkered Rubber Stock, five shot, 38 Caliber, Rim Fire. Length Barrel, 2¼ inches; length Revolver, 6¼ inches; weight, 12 ounces. Steel Barrels, Frames and Cylinders—Prices: Plated, \$2.25; Plated, Engraved, \$3.25; Plated, Ivory, \$3.25; Plated, Pearl, \$3.75.

Shattuck's "Unique" Automatic Revolvers.—Thirty-two Caliber, Rim Fire, Rubber Stock Saw Handle, Octagon Barrel, Fluted Cylinder; Swing-Out Cylinders, price, \$2.10.

Remington System Breech-Loading Single Barrel Shot Guns.—No. 2, Blued Barrel, Walnut Stock, Case-Hardened Mountings, 16 B Gauge, weight, 6¼ pounds, 32 inch Barrel, \$7.

They make the following quotations on the goods of the American Buckle and Cartridge Company:

	Discount, per cent.
Paper Shot Shells, IXL, waterproof. .40 and 5	
Paper Shot Shells, special quality, not waterproof. .40 and 10	
Brass Shells, Fowler's patent, 10 and 12 gauge, per hundred.	\$3.25

The above prices are 60 days, or 2 per cent. for cash in 10 days.

The company also state that they are prepared to fill orders on Ammunition at prices which are always under those of the combination, and that they can supply any make desired, with prompt delivery.

Items.

It is announced that Crowell & Worthington Company have purchased of Tiffany & Co., Providence, R. I., the Hardware business conducted by them for the past 38 years at 72 Weybosset street, where they will continue it as jobbers of Hardware and Tools.

Horton, Gilmore, McWilliams & Co., of Chicago have now got in part of their line of Union Pocket Knives, Shears and Scissors. The total weight of one order received by them last week was 13,000 pounds, which took a gang of 30 floor-men half a day and one night to unpack and arrange on the shelves and the reserve stock floor. Three duplicate orders of the same size are on the way. To accommodate this stock will require shelving 180 feet in length and 10 feet in height. The Pen Knives are being made up for this house in entirely new styles and new patterns, special attention being given to their finish. The blades are marked on both sides of the hilt, the "Union Cutlery Company" appearing on one side and a double knot on the other. The firm are now in the market ready to take orders for these goods. Five traveling men, in addition to these referred to in a previous article, were engaged last week to sell specialties. The largest jewelers' tray factory in Chicago has for the past two weeks been running exclusively on traveling men's sample cases for this firm alone, and the force was insufficient and had to be enlarged to fill the order on time.

A recent issue of the London *Ironmonger* contains the following curious and amusing statement in the letter of its Sheffield correspondent, in regard to the importation of a well-known line of Sheep Shears:

In the United States the firm have also an improved trade, due to a successful stroke on

the part of one of their customers. This gentleman contended that the Shears sent him by Burgon & Wall were wrongly classed at the Custom-House—that they were large Scissors, and not Shears proper. The contention was sustained, and the Shears were admitted as Scissors at 12½ per cent., instead of having to pay the 45 levied on Shears. As the immediate result of this 'cute' movement the orders coming to Burgon & Ball from the States increased very considerably.

C. F. Guyon & Co., 97 and 99 Reade street, New York, in their advertisement on page 81 give in an attractive form the names of the different manufacturing concerns for whom they are agents. It will be observed that a number of leading houses are thus represented.

J. T. Henry, Hamden, Conn., issues a circular relating to two new patterns of Pruning Shears. No. 22 is a Ring Shears, with spiral spring without guards, and is described as one of his very best grades. No. 32, his Connecticut Pattern, with spiral springs, and is referred to as a well made, strong, popular and durable Shear.

The following are the terms in which application was made to a Hardware house by a person desiring a position as traveling salesman:

A traveling salesman who can drink rum, play poker, sell a few goods and raise h—generally would like to make a new deal. Have you any use for such a man? Address, "W. O. R. K.," P. O. box —, Boston, Mass.

N. B.—You can secure this man for something less than \$10,000 a year.

It is scarcely necessary for us to say that no engagement was made, and that the application was not regarded as requiring a reply. There is in the Hardware business, as in other lines, but little use for salesmen of the above type, the position of the commercial traveler calling for the best abilities and sterling worth.

The trade will observe the advertisement on page 76, in which the Enterprise Mfg. Company, Philadelphia, Pa., illustrate some of their Mills and call attention to the other goods of their manufacture.

E. Covert Mfg. Company, Farmer Village, N. Y., issue an exceptionally neat and well-printed catalogue of their Neck Yoke Centers, Neck Yokes and specialties in Saddlery, Coach and General Hardware. Among the specialties are to be noticed their Wagon Jack, Umbrella Rack, Adjustable Blotter and others. The catalogue gives a full description of the goods, with illustrations and list prices, which are subject to a general discount of 25 per cent.

A. H. Andrews & Co., 195 Wabash avenue, Chicago, Ill., issue a circular describing Culp's Patent Motor, which is designed especially for show windows. By this contrivance a table or platform containing goods is kept in constant revolution, thus making an attractive display. It is used in some Hardware stores with good effect.

Wm. Bryce & Co. and H. B. Newhall Company played a game of base-ball at Prospect Park last Saturday, July 28. Game was called in the seventh inning, two of Newhall's men being disabled, when the score stood 29 to 7. The umpire called the game back to the sixth inning, when the score stood as follows:

Innings.	1	2	3	4	5	6
W. B. & Co.	4	5	5	4	4	2—22
H. B. N.	3	0	2	0	2	0—7

Kerr Bros. & Co., Hicksville, Ohio, besides their regular line of Ash Handles, Cant Hooks, Cant Hook Handles, &c., also make Flag Poles and Campaign Torch Handles and Sticks.

It will be seen from the Special Notice on page 51 that Ryan's Improved Shingling Bracket is offered for sale. This patented device, which has been to a good extent introduced throughout the country,

is referred to as satisfactory in its working. The patentee desires to dispose of it to some party who can manufacture advantageously, perhaps in connection with other goods. A sample of the Bracket can be seen at this office, and Mr. Ryan may be addressed as stated in the advertisement.

It will be observed that Underhill, Clinch & Co., in their advertisement on page 64, call prominent attention to the fact that they carry a stock of Russell Jennings' Auger Bits, and allude also to other lines to which they give a prominent place.

An illustration of Moon's Patent Iron Lever Cutting Box, manufactured by the Wayne Works, Richmond, Ind., is given on page 96. This machine, which has been on the market for some time, is referred to as having given entire satisfaction, and is alluded to for its convenience, comparative inexpensiveness, and the efficiency of its working.

When the late William A. Ives went to New Haven, about 40 years ago, it was with the intention of passing the remainder of his life there without attending to business. He had a moderate fortune, esteemed sufficient for his wants. His active temperament would not, however, allow him to remain idle, and in a few years he became interested in the business of making Boring Implements. For more than 35 years he devoted himself to it without intermission, becoming one of the prominent New England manufacturers. This attention to business was continued to the last, and even on the day before his death he gave specific instructions concerning its future management. An appreciative tribute is paid to his intelligence, character and sterling worth by the Rev. Dr. Munger in an address made at his funeral.

Hibbard, Spencer, Bartlett & Co., Chicago, Ill., have issued, under date July 20, a 20-page price current referring to a varied line of goods—Tin Plate and Metals, Campaign Torches, Cutlery, Apple Parers, Lamps and Lamp Stoves, Axes, Guns, &c.

New Haven Staple Works, New Haven, Conn., in referring to their patent-made Staple, refer to the stiffness given it by the cold drawn process of making, thus allowing the Staples to be driven into harder wood than others without spreading in the bend. Referring further to this matter they say:

What is apparently lost in our Staple through necessity for clinching is offset by the fact of the stock being drawn out ½ inch and over, thus giving a rigid and sharp point for entering the hardest woods, and still retaining malleability enough to be clinched smoothly. Nearly 20 years' experience has enabled us to produce Staples in Iron, Steel, Brass or Copper Wire in either bright, japanned, galvanized or tin finish, and thanking the trade for these years of patronage we hope by persevering application to merit further favors.

Their label represents the pattern of their Staples and contains the motto, "The nimble sixpence is better than the slow shilling."

The trade will observe the advertisement of the Francis Axe Company, Buffalo, N. Y., printed in color and occupying page 68. It represents one of their All Steel Axes, full size, and shows also their Axe Wedge and Axe Bit Stone. The company are making largely All Steel Polished Axes, both etched and labeled, in addition to the Standard Axe. They refer to the fact that low prices are now ruling in Axes, while Steel, Coal, Borax, Emery, Grindstones and Boxes are higher than last year.

"Handy Notes and Queries" is the title of a pamphlet published by Henry Hopkins & Co., 99 Reade street, New York. It contains a variety of useful information relating especially to Hardware, Tinware

and Metals, giving many tables in regard to a variety of matters connected with these lines. It is a pamphlet of 160 pages, and the variety of its subject matter is indicated by the table of contents, which occupies seven pages. A good deal of new matter appears for the first time in this edition.

In their colored page advertisement, occupying page 67, the Shepard Hardware Company, Buffalo, N. Y., illustrate their Shepard's Lightning Quadruple Motion Freezer, and allude to it as the Freezer of the future. The special points that are made in regard to it will interest the trade. At the same time they allude to their Fruit Presses, Blind, Shutter and Gate Hinges, Stove Dampers and miscellaneous goods, calling attention to the variety of manufactures which they put on the market.

We see by one of our exchanges that the Allen & Jemison Company, Tuscaloosa, Ala., have been awarded the contract for furnishing the Lumber, Shingles, Hardware, Cement, &c., necessary to the completion of the locks and dams now being constructed above the city.

By the special notice on page 51, it will be seen that the advertiser, who may be addressed as Meta, *Iron Age* office, desires quotations on 350 gross Tinned Malleable Iron Keys.

L. E. Wright, Douglass, Kansas, announces July 25 that he has sold his Hardware and Implement business to Woodyard & Imus, who are commended to his patrons as his successors.

The Fraim Lock Works, Lancaster, Pa., have appointed C. F. Guyon & Co., 99 Reade Street, New York, as their sole agents for the Middle and Southern States, and Cutler, Woodrough & Co., Boston and Chicago, for the Eastern and Western States, for the sale of their improved Scandinavian Padlocks, to whom orders and inquiries should be addressed. They allude at the same time to the merit of their Jail Padlocks, which are made of malleable iron throughout. The cheaper grades are painted red, with polished shackles and keys. The better grades are put up with flat steel keys, making them susceptible of many changes.

It has recently been charged against the Stanley Rule and Level Company that they are very dull, to be willing to manufacture one tool—called "Odd Jobs"—embracing nearly their whole line; and then sell it for 75 cents. To this the company reply, that all depends on how many of the new tools can be sold. A brisk demand has sprung up already; and it seems likely that carpenters, amateurs and others will buy "Odd Jobs," though they may already own a kit of the separate tools so ingeniously combined in this.

Trade Topics.

The following communication from an enterprising and well known Iowa Hardware house calls attention to the question as to the propriety of charges for box and cartage, and suggests that we open our columns for a discussion of the subject for the purpose of giving retailers an opportunity to express their views, and unite if may be in a protest which will settle the matter. In laying the communication of our esteemed correspondents before our readers we desire to say that we shall be glad to have a thorough discussion of the subject, but in the interest of fair play shall hope to hear from both sides. A full discussion of the question, bringing out the facts in the case, such as the usage of the trade in the matter, the proportion such charges bear to the value of the

goods, whether they more than cover the cost to the shipper of boxes and cartage, and whether or not the retailer in turn realizes anything from the sale of the packages, and such other points, will contribute to the solution of this vexed question. If there are serious difficulties in the way of jobbers and manufacturers acting on the suggestion of our correspondents and including the cost of case and cartage in the prices of goods, we hope this will be pointed out.

We would like to have you open your columns to the retail Hardware dealers from all parts of the country and they in return will all respond on the subject of "Box and Cartage," items which are invariably attached to each and every bill from a jobber, and which in most instances amount to as much or more than the "cash discount" on the bill, and in many cases to 4 or 5 per cent. of the bill. We know the retailers will all let themselves be heard from, and when they have done so we earnestly hope the jobbers will consider the matter. If the jobbers cannot afford to furnish the boxes and teams for conducting their business, then let them add this cost to the cost of the goods, and collect it in an indirect way and not have such items as B. & C. 50¢, B. & C. \$2.60, &c., &c., or Boxes 30, 35, 35, 40, 35, 35. Cartage, 50; Total \$2.60, staring the retailer in the face. Suppose the retailers were to notify a customer after he had purchased a bill of \$4 or \$5 worth of goods that he must pay an additional 10 cents to cover drayage from the depot, wrapping paper, twine, &c., would he get much trade? Why no! That customer would rather go to another store where that amount was figured in with the price and pay 10 cents more for his goods, and not have that infernal charge staring him in the face. Many of the jobbers do not charge for boxing and carting any more, while others are ready to abolish the practice as soon as they can make it unanimous. Now, it only remains for the retailer to make a firm stand, and absolutely refuse to pay it. Come now, brother retailer, join in, let us hear from all of you, and with our united effort we can probably wipe out this yearly expense of from 1 to 5 per cent. of our business.

From Packard & Co., Greenville, Pa., we have the following suggestion in regard to the marking of goods in shipping, which will commend itself to the approval of our readers. The annoyance to which they refer is so easily corrected that it is to be hoped that their suggestion will be acted upon:

We recommend strongly that all shippers of Hardware which is boxed put on the lid plainly

From.....
We are constantly annoyed by a drayload of goods coming in from half a dozen different shippers, which we are unable to distribute in our store and warehouse until opened and the contents revealed. The above precaution would simplify this matter greatly.

In regard to the manner of putting up Hardware in boxes we have the following suggestions from a Pennsylvania Hardware house:

1. Adapt the boxes to the quantities that are best suited to the requirements of the retail trade.
2. Boxes should be made with the strength required for the goods which they contain.
3. All boxes should have the numbers on the labels quite large, so that they may be readily seen in a dark room.

All Hardwaremen are constantly annoyed by neglect of the above essentials in Hardware packages. One-fourth of all goods received arrive in damaged or destroyed boxes.

We lay before our readers the following report of the Louisville Hardware market, which comes to us under date of July 27:

The Hardware business of Louisville, Ky., continues to improve and expand in volume, with no upward movement in prices. There is no trouble in selling wares; they go out fast enough; but the question uppermost with each dealer is whether any profits are realized. There is no doubt about it, some lines of goods are being handled on too small a margin. For instance, take the one article of Cut Nails. Where the wholesale Grocery houses handle nearly as many, in the aggregate, as the Hardware trade, they are used by them as a "go" or leader, frequently being advertised at actual cost, simply to draw the country custom. Some Hardware jobbing houses give instructions to their salesmen to throw Nails in at any price, just so the orders average up well. Speaking further on Nails, just as the trade was settling satisfactorily down to last cut price of \$1.85, delivered, a sudden rupture between the Pittsburgh and Wheeling packets causes a new cut of 2½ cents per keg in freight, making price of \$1.85½ delivered in carload lots of 240 kegs. This may be temporary, however. Dealers who usually buy heavily on the summer rise in the Ohio River for the fall trade are still a little dubious, for fear another unseen factor may cause another cut. Considerable sympathy is, for once, being expressed by the jobbers for the manufacturers in several lines, for, although the mills' statements, so often urged as inducements to buy, of "selling below costs," &c., are not given much credence to, yet there must be a limit to even ductility.

The consumers want cheap goods—providing the quality is up to standard—as the tendency is to make use of more labor-saving devices; yet even they are satisfied with present prices. The jobbers are anxious for some signs of an advance, and it does seem time for the manufacturers, individually, to call a halt and demand a fair return for money invested in plants.

The Union Indurated Fibre Company,

37 Barclay street, New York, under date July 20, issue the following schedule of prices, which are designated as jobbers' lowest selling prices for their line of Indurated Fibre ware. Terms net cash 30 days, or 2 per cent. discount for cash in 10 days, f.o.b. cars at factory, or delivered at the New York or Chicago warehouses:

Combinations in England.

In connection with the announcement of a combination formed by the Coffin Furniture manufacturers of England, in which it is stated that the different manufacturers surrendered their separate existences in order to merge them into one large company, the London *Ironmonger* refers to the fact that in these days the favorite remedy for excessive competition and resulting low prices is some agreement among manufacturers to restrict production or to regulate prices. In this instance, however, the pooling is referred to as going beyond these ordinary methods, and so completely has it been carried into effect that the promoters of the enterprise state that the accomplishment of their plans leaves no outstanding competitor. Referring to the matter the *Ironmonger* remarks editorially :

From the point of view of the promoters of the company, therefore, everything is exactly as it should be. All competition is thoroughly extinguished, the interests of all concerned are identical, instead of being at variance, and all the makers will work for the good of their company instead of "slaughtering" prices and cutting each other's business throats by fierce competition. Thus, like the traditional conclusion of a play, "all ends happily." That being so, it is, perhaps, scarcely the right time to suggest that there may be "rifts within the lute" before long. For the moment the company enjoys a monopoly, and, in appealing to the public for capital, is at special pains to prove that that monopoly is a very profitable

one. Unless human nature is very different from what we have always found it to be, we take it for granted that the new company will not long be free from competition. Its very constitution will invite rivalry, and its acknowledged profits may have the effect of making that rivalry formidable. We do not for a moment deny that the directors and the firms who have assented to the amalgamation know their business better than any outsider, yet we are certain that they must have competition. When their competitors arise the company will doubtless endeavor to crush them by lowering prices and other devices usual under similar circumstances. In this the company may succeed—or may fail if the competition is started by strong firms—but it will be at some expense to itself. The process of manufacture is not very intricate or one which needs much capital—hence there is every inducement for firms with capital and connections to go into the business. We express this opinion in no spirit of hostility to the company, of course, but merely because we are by no means convinced of the wisdom, or the advantage to the trade, of the combination. The company will be best judged by their course of action, how ever, and for that we shall have to wait.

Mineral Product of the United States in 1887.

Dr. David T. Day, Chief of the Division of the Mining Statistics, has submitted to the Director of the United States Geological Survey a summary statement of the mineral product of the United States in 1887, in advance of the official report "Mineral Resources of the United States, 1887." The total value of the mineral products is \$538,056,345; it shows a wonderful gain over 1886, and is \$100,000,000 greater than the output of 1885. The United States lead the world in the production of minerals. The principal gains in 1887 were in the production of metallic ores and the fuels necessary for smelting them. The production of pig iron alone increased more than \$26,000,000; the high price of copper caused notable expansion in that industry. The product of coal is the largest ever recorded. Taken as a whole, the report shows a year of great prosperity for the mining industry. The great total value of more than \$500,000,000, the report says, resulted not only from an increase in the quantity of minerals mined, but also from a general advance in the prices of metals. It may be several years before this total is exceeded, and the year 1888 will fall considerably below it. Among many reasons for the decrease this year is the decline in railroad building. The principal items of interest concerning each product follow:

IRON. The principal statistics for 1887 were: Domestic iron ore consumed, about 11,300,000 long tons, value at mines, \$33,900,000. This is an increase over 1886 of 1,300,000 tons in quantity and \$5,900,000 in value. Imported iron ore consumed, 1,194,301 long tons; total iron ore consumed in 1887, about 12,494,301 long tons, or 1,454,868 tons more than in 1886. Pig iron made 6,417,148 long tons; value at furnace, \$121,925,800. This is an increase over 1886 of 733,819 tons in quantity and \$20,730,040 in value. Steel of all kinds produced, 3,389,071 long tons, an increase of 776,569 tons over 1886; value at works, \$103,811,000. Total spot value of all iron and steel in the first stage of manufacture, excluding all duplications, \$171,103,000, an increase of \$28,603,000 as compared with 1886. Limestone used as flux in the manufacture of pig iron in 1887, about 5,377,000 long tons; value at quarry, about \$3,226,200.

GOLD AND SILVER.—The total value of gold produced in 1887, according to the mint authorities, was \$33,100,000, a decrease of \$1,900,000 from 1886. Silver increased from \$51,000,000 in 1886 to \$53,441,300 (coining value) in 1887.

COPPER.—Total production 184,670,524 pounds, of which 3,750,000 pounds were made from imported pyrites. The total value was \$21,052,440, at an average of 11.4 cents per pound. The estimated total consumption of copper in the United States increased by about 14 per cent.

LEAD.—The production of lead was 160,700 short tons, valued at \$14,463,000 at \$90 per short ton. The heavy increase of "desilverized" lead from 114,829 short tons in 1886 to 135,552 in 1887 was probably due to the importation of Mexican lode silver ores. The large product of non-argentiferous lead, 25,148 short tons, is due chiefly to the development of the St. Joseph district in Missouri. The production of white lead and the several oxides from pig lead increased to a total of about 75,000 short tons.

ZINC.—The producers' returns show an increase from 42,641 short tons in 1886 to 50,140 in 1887. The price increased to 4½ cents per pound, making the total value in 1887, \$4,782,380. The production of zinc oxide was practically steady at 18,000 short tons, valued at \$1,440,000.

QUICKSILVER.—Production and value increased from 29,981 flasks, valued at \$1,060,000, to 33,825 flasks, valued at \$1,429,000. Except 65 flasks from Oregon, the total supply came from California. The price in 1887 varied from \$36.50 to \$48 per flask in San Francisco.

ANTIMONY.—The production, all in California, was 75 tons, valued \$15,300—double the production of 1886.

ALUMINUM.—The production of aluminum bronze containing 10 per cent. of aluminum increased to 144,764 pounds in 1887, valued at \$57,905. Other alloys, principally of iron and aluminum, amounted to 42,617 pounds, worth \$17,000. This shows a great demand for these alloys, for it is more than double the product of 1886.

PLATINUM.—Considerable search by dealers produced 448 ounces of crude platinum, valued at \$1838. Part of this came from British Columbia. This is more than has been produced in all previous years taken together.

COAL.—The total output of the mines, including colliery consumption, was: Pennsylvania anthracite, 37,578,747 long tons (increase over 1886, 2,725,670 long tons), or 42,088,197 short tons (increase, 3,052,751 short tons); all other coals, 87,837,860 short tons (increase, 14,129,403 tons); making the total output of all coals from mines in the United States, exclusive of slack coal thrown on the dumps, 129,925,557 short tons (increase, 17,182,154 tons); valued as follows: Anthracite, \$84,552,181 (increase, \$8,433,061); bituminous, \$97,939,656 (increase, \$19,458,600); total value, \$182,491,837 (increase, \$27,891,661). The above figures show a notable increase in 1887 over 1886 in the aggregate output and value of both anthracite and bituminous coal.

COKE.—The total production of coke in the United States for the year ending December 31, 1887, was 7,357,487 short tons, valued at \$15,725,574. This is the greatest product ever reached in the United States, being 1,022,419 tons greater than in 1886.

NATURAL GAS.—The production of natural gas in the United States in 1887 was equivalent to 9,055,000 short tons of coal displaced, value \$13,582,500. In 1886 the corresponding quantity was 6,353,000 tons, worth \$9,847,150.

BUILDING STONE.—Direct returns from producers show a total value of \$25,000,000. This marked increase of \$6,000,000 shows that the statement for 1886 was too small.

BRICK AND TILE.—Value \$40,000,000. This represents an increase of about 13 per cent. in the production of brick and a de-

crease in tile, owing to the drouth in 1887 in Indiana and Ohio. Prices were slightly lower.

LIME.—The production is estimated at 46,750,000 barrels, with an average value of 50 cents per barrel, an increase for the year of 10 per cent.

CEMENT.—The production of cement from natural rock was 6,692,744 barrels, valued at 77½ cents per barrel, making \$5,186,877 as the value of the year's product; increase, \$1,196,877.

PRECIOUS STONES.—The value of American gems in the rough state amounted to \$88,600, besides gold quartz for specimens and gems, valued at \$75,000.

SALT.—Production in 1887, 7,831,962 barrels (of 280 pounds); value, \$4,093,846. The annual production has increased each year since 1883, but the total value has declined, being less in 1887 than in 1884, although only 6,514,937 barrels were made in that year.

BORAX.—Production, 11,000,000 pounds, all from California and Nevada. Total value, \$550,000, at 5 cents per pound for the average grade. The price was rising at the close of 1887.

PYRITES.—Production, 54,500 long tons, valued at \$210,000, at \$46 per ton at the mines.

MINERAL WATERS.—The product which was sold amounted to 8,259,609 gallons, worth \$1,261,473, a slight decrease.

A New Steam Engine Packing.—A new kind of asbestos packing is now being introduced in England, which differs from the ordinary packing in having metal tubes made of a lead alloy running through the center. These tubes impart more strength to the packing than when it is made of asbestos fiber alone. Lead wires have before now been used, to make up for the somewhat brittle nature of the asbestos fiber; but the extra weight of these has been found somewhat objectionable. Tubes are now adopted in preference to solid lead cores, because of their smaller weight. The body of the packing is of asbestos yarn, plaited around the tubes by special machinery, which at the same time threads asbestos fiber through the tubes. The object of filling the tubes with asbestos fiber is that in the event of excessive heating and melting out of the tubes there shall still be a serviceable packing left. Asbestos, when saturated with steam, expands considerably, and the expansion of the inside and outside fibers would fill the space vacated by the metal. The number of tubes varies with the diameter of the packing; an asbestos rope 1 inch diameter has six tubes of $\frac{1}{8}$ inch external diameter inserted. For smaller packings five or four tubes only are used. The packing is being brought out by Messrs. John Bell & Sons, 118 Southwark street, London, S. E.

A Boston paper states: It is gossip that the French syndicate and the copper companies are more likely to renew their contracts for six years at the expiration of the three-year contracts than to break with one another before the present contracts expire. Such gossip is rather faith or opinion than anything else. The present contract runs through 1890, and many things may happen in 29 months.

An English firm, Messrs. Marshall & Co., of Keighley, have brought out what is in a measure a novelty in the engine line, being a triple expansion engine of the semi-portable type. It is of the "underneath" design, with steam-jacketed cylinders, 5½, 9 and 15½ inches in diameter, with 14-inch stroke. The high-pressure cylinder is fitted with automatic cut-off gear. The boiler is of the locomotive pattern. We understand that on trial exceedingly economical results have been obtained with the engine.

The Effect of the Chicago Waterway on Lake Michigan.

The proposed establishment of a navigable waterway between Lake Michigan and the Mississippi River has excited the apprehension of publicists, who fear that the level of the lake would be disturbed, with possibly serious consequences to important navigation interests. At first blush it would seem to be impossible to tap the lake with an outlet taking away 600,000 cubic feet per minute as proposed without affecting the supply of water, enormous as it is. But ex-Senator Doolittle allays all fear on this ground in a recent communication to Senator Sherman which is of general interest. He says that as Lake Michigan and Lake Huron (which latter receives the waters of Lake Superior also) are connected by straits at Mackinaw which are at least three miles wide and have an average depth of more than 100 feet the level of Lake Michigan could not be lowered without lowering the level of Lake Huron. But the Detroit River is the present outlet of Lake Huron, with a width at its narrowest part of 2200 feet and an average depth of 23 feet. The proposed waterway would divert part of this flow to the Mississippi, and it is calculated that 600,000 cubic feet per minute thus diverted would not diminish the flow at Detroit more than one in twenty, or so slight a diminution as to be scarcely perceptible. It would, however, slightly reduce the flow at Detroit rather than cut down the level of Lake Michigan. As to the effect on the Mississippi, Mr. Doolittle says: "It is undoubtedly true that such a flow of water added to the volume of the Mississippi below the mouth of the Illinois, would in times of low water deepen the channel over all the bars a foot or more, and thus improve the navigation of the lower Mississippi more than any other possible improvement. And, as it seems to me, it is equally true that such a waterway between the great lakes and great rivers of the United States would do as much to cheapen and regulate the rates of heavy transportation between the lakes and navigable rivers east of the Rocky Mountains as the Erie Canal now does between the Lakes and the Atlantic seaboard."

A Sheet-Iron Belt.—In the recently issued third edition of Mr. John H. Cooper's book on "The Use of Belting," Mr. John Spiers, of Worcester, Mass., gives the following account of a sheet-iron belt: "A lathe used for turning rolling-mill rolls, compound geared, has a 48-inch pulley. This is driven by an 18-inch pulley on the countershaft, which makes 120 revolutions per minute and is 8 feet from the 48-inch pulley, measured from center to center. Both pulleys are of iron, smoothly turned on the faces. A 7-inch double leather belt was used on these pulleys, but would slip when the turning tool became dull. This belt was replaced by one made of Russia sheet iron, the same as that used for stove-pipes and parlor stoves, and was riveted together in the ordinary way. It was 7 inches wide and 2 inches longer than the leather belt, the extra length making up for the want of elasticity in the iron. During one year's steady run this iron belt could not be slipped even when a heavy cut on a 25-inch roll was taken, which broke a Sanderson steel tool having a section of 2 x 2½ inches, a cutting surface, of 2½ inches, a feed of ¼-inch per revolution and an overhang of 4 inches.

The engineer on the New York Water Works devised an ingenious method for getting through quicksands at the Quaker Bridge dam. In sinking a diamond drill

for the purpose of ascertaining the geological formation a quicksand was encountered which barred further progress. To overcome the difficulty the drill was withdrawn and a very liquid cement poured into the hole. This found its way through the sand, and when set formed a solid column resting on the rock below the quicksand. A second hole driven through this cement pillar passed the troublesome stratum without difficulty.

Power Distribution in Mills.

In a recent lecture on "The Evolution of the Modern Mill" delivered at Sibley College Mr. C. J. H. Woodbury remarked that the early form of distribution of power consisted in placing a vertical shaft extending through the whole mill and distributing the power at each story by means of beveled gears, generally of skewed-beveled form. The mechanical defects of such a method of distributing power, with regard to protection, repairs and necessary care, are readily apparent, and there have also been many severe accidents caused by the breaking of teeth in these gears. The present method of distributing power in this country is entirely by lines of belts extending up through what is known as a belt tower, which constitutes an element of great fire hazard to a mill. In some cases the belts are carried from story to story, covered by a casing of wood, and in other instances the tower forms a flue which may be the means of the rapid spread of fire throughout the building.

It would be impossible to arrange the distribution of power in many mills to conform to conditions of safety without reorganizing the whole plant, which would of course be impracticable. But in many instances modifications can be introduced which will diminish the hazard to a great degree. When the pulleys and belting are covered with sheathing in each room the continuity of these flues can be broken by removing this sheathing down to the height of 4 or 5 feet above the floor, so that the covering will merely constitute a physical protection to any one approaching the belting. The best method of arranging the belt tower has been in the case of a mill at Fall River, which was erected upon the ruins of a building destroyed by a fire originating in the belt tower. The machinery is driven by a steam engine situated in an ell projecting from one side at about the middle of the mill, and the main belt communicates to pulleys in a stone masonry tower located directly inside the walls of the main mill, and thence, from pulley to pulley, the power is communicated to each floor by shafting passing through holes left in the tower, and in no instances by means of belts. There is a separate stairway inside of the tower for lubricating the journals, &c., and the top of the tower is covered with skylights protected underneath by a wire netting. In case of a fire in the belt tower the heat will readily break the glass at the top, and the fire will tend to go up and out of the tower rather than through the mill.

According to the *English Mechanic* a black coating for brass objects is made by dissolving 1.05 ounces of carbonate of copper, while being well stirred, in 8.80 ounces of spirits of ammoniac, 17.60 ounces of water being added to the solution. The brass objects should have been well polished with emery paper, and are fastened to brass or copper wires. They are plunged for a short time in the solution, and when completely blackened are rinsed in water. They are then dried in sawdust, and finally rubbed with oil varnish diluted with oil of turpentine. This black coating is said to be durable, and to stand exposure in the open air.

Humphrey's Circle Gauge.

The cut given below represents one of an interesting series of tools which are made by the Humphrey Tool Company, Warren, Mass. This gauge is intended for use in all kinds of wood or metal working where a scratch line is required on straight or curved edges. Its construction is shown in some detail in the illustration, which represents it full size except

*Humphrey's Circle Gauge.*

in length. As there indicated, it will be seen that the head is held in place by a lever, the operation of which is simple and efficient. The marking tooth, which is made of hardened steel passes through the bar, and emphasis is laid on the fact that the opposite points are always the same distance from the flat face of the gauge on the one side, and from the post on the other, thus making it easy to run a parallel line with the straight edge of the work, and by reversing the tool continue the line around all the curves. A fine adjustment is secured by means of the adjusting screw at the end of the bar. The simplicity and efficiency of this tool, the excellence of the workmanship and finish, and its comparative inexpensiveness, are points which are made in regard to it by the company. For the manufacture of this and other tools the company advise us that their factory is furnished with the most approved machinery, and first-class workmen are employed, so that they refer with confidence to the excellence of their manufactures.

Cline's Fire-Proof Cooker.

We show in the accompanying engraving a form of cooking apparatus recently brought out by the Cline Mfg. Company, of 70 and 72 West Washington street, Chicago, Ill. The engraving represents the device placed in position upon the stove and having the outer casing broken away, showing the internal arrange-

*Cline's Fire-Proof Cooker.*

ment of parts. The device is made with a vessel of tin supported by an enveloping shield of galvanized iron. The bottom of the cooker is $\frac{1}{4}$ inch from the stove, which allows a circulation of hot air beneath and around the inner vessel of cooker. This arrangement of parts, the manufacturers claim, prevents the food contained

in the vessel from burning. It is made in sizes having a capacity of 2, 3 and 4 quarts, and is adapted for use upon any stove.

Champion Campaign Torch.

The Postal Package Company, 34 South Paca street, Baltimore, Md., are putting on the market the Champion Campaign Torch herewith illustrated. It is made of tin on

*Champion Campaign Torch.*

washer which rests on the flange of the can, and on which the top is seated when screwed down, rendering the torches; it is claimed, absolutely oil-proof. It will be observed that the burner is provided with a drip cup, to avoid soiling the clothes of those carrying the torches. The point is also made that this torch can be filled with exceptional rapidity. It is stated to have a capacity sufficient to burn four hours. Besides being admirably adapted as a campaign torch, it is also referred to as suitable for engineers, firemen, railroad men and others working about machinery.

According to *La Nature* blue prints may be given the black tone by plunging them into a solution of 4 parts of potash

in 100 parts of water, then when the blue color has entirely disappeared under the action of the potash, and a yellowish color has taken its place, they are immersed in a solution of four parts of tannin, also in 100 parts of water; then washing them again we obtain prints whose tone may be assimilated to that of pale writing ink.

New Indurated Fibreware.

The Union Indurated Fibre Company, 37 Barclay street, New York, are offering as new lines Oval Keelers shown in Fig. 1, which are referred to as serviceable for foot-baths, dish-pans, &c. Another addition to their house-furnishing line is shown in Fig. 2. These chamber pails are, it will be observed, a different shape from their slop jars. They are described as

*Fig. 1.—Oval Keeler.*

superior to tin or galvanized iron in being inodorous, and as cheaper in the end, while as compared with earthenware they are not liable to breakage. The company have also added to their line of stable buckets 18 and 20 quart sizes, as they have had calls for these large buckets. They are described as of approved pattern and suited for heavy work. The champagne cooler which they have lately offered in their regular finish, they are now furnishing in their mosaic inlay decoration, a finish to the attractiveness of which they allude. Their lines of measures are now complete, and are offered in the regular nests of five, including quart and 2-quart. The demand for these measures, both wet and dry, has exceeded the ex-

*Fig. 2.—Chamber Pail.*

pectations of the company, and customers are obliged to wait their turn in the filing of orders. The demand will, however, soon be met, as additional machinery for turning out these goods is being rapidly put in operation.

Buffalo has begun to take prominence as an ore receiving and shipping port. A new ore dock, the Minnesota, was recently opened there, and the old docks are still undergoing improvements. Contracts have been closed for the construction and equip-

ment of a large dock on the Blackwell Canal, to be used for receiving iron ore from lake vessels. H. K. Wick, of Youngstown, Ohio, who is largely interested in coal and iron ore at Ohio ports, is at the head of the scheme. Room will be had for the storage of 100,000 tons of ore. The contracts call for the completion of 400 feet of dockage, with hoisting apparatus, railway tracks and switches by August 9. Four Brown hoists, which will have the capacity to take out 1000 tons of ore a day, will first be erected. Later two others will be added, giving the dock facilities for the unloading of 1500 tons daily.

New Package for Liquid Glue.

The Le Page Glue and Cement Company, Gloucester, Mass., are putting up W. N. Le Page's improved glue in a new style of can, which is represented in the accompanying illustration. The special feature of this can is the fact that the cover is not screwed on, but fits snugly and is held in place by a brace or catch, as

W. N. LePage's Liquid Glue.

shown in the cut. The brush is inserted, as indicated, through the top of the cover, in the usual manner.

Hudson's New '88 Apple Parer, Corer and Slicer.

The accompanying illustration represents this machine, which is manufactured by C. E. Hudson, Leominster, Mass. It is of a similar design to the Little Star, manufactured by the same house, and is alluded to as doing excellent work, although it does not possess all the advantages claimed for the Little Star, which the manufacturer regards as of exceptional merit, referring especially to the fact that the parings and juice from the apple do not fall upon the machine to gum and clog it. The New '88 is a cheaper parer than the Little Star, and is designed for a class of trade calling for low-priced goods, and is put on the market more particularly to meet cheaper machines offered by other manufacturers. The simplicity of the construction of this machine is emphasized, while it is claimed that its work is exceptionally satisfactorily performed. It pares, cores and slices the apple, and pushes the core from the fork. The edge of the paring knife is not made round, as has heretofore been done, and consequently it does not gouge into the apple, taking off more of the fruit than the skin. This new slicing and coring knife is described as so arranged that the fruit is less liable to be broken from the fork than in other parers.

The slicing knife is made of one piece of steel. The machine has a steel crank shaft and screw-tinned cast-steel slicing knives and crankshaft, and other novel features. It is claimed that it will operate on larger and softer fruit than other parers, and is alluded to in tastiness of appearance,

Hudson's New '88 Parer, Corer and Slicer.

finish, durability and good work as having advantages over other parers of its class.

Electric Patent Pruner.

The Mechanics Mfg. Company, New Bedford, Mass., are putting on the market a new pruner, which they have named the Electric. It is represented in the illustration herewith given, which shows quite clearly its special features. It will be seen that the chisel or cutting knife has a rack, which gears into a toothed segment, which is operated by a lever or arm which is cast as a part of it. To this the cord is attached, passing down to the person using the pruner. The efficiency of this implement and its convenience in use will be appreciated by the trade. These pruners are made in two sizes. No. 1, 10½ inches

The Electric Patent Pruner.

in length, 1½ inches wide; weight, 17½ ounces. It is intended for cutting branches up to ½ inch in diameter. The larger size, No. 2, is 12 inches long, 1½ inches wide and weighs 27 ounces. It will cut branches ¾ inch in diameter. With each pruner is included a line and ball handle for the same, the whole being neatly packed in a wooden box with sliding cover.

The Quick Meal Torch.

The Ringen Stove Company, of St. Louis, Mo., are directing the attention of the trade to their Quick Meal gasoline torch, a general view of which is shown in the engraving presented herewith. This

torch is of simple construction, and represents the results of several years' careful consideration of the requirements of the trade in this direction. The general arrangement of the parts is clearly indicated in the engraving, which shows the torch with the burner lighted. The reser-

The Quick Meal Gasoline Torch.

voir has a capacity of 5 quarts. The flame is claimed to be bright, clear and full, and will not blow out in the strongest wind. The makers claim that the flame given by this torch is larger than that of any similar construction. The torch is especially adapted for foundries, markets, shops, and also in places where it is exposed to the weather. The company propose to push it, and endeavor to make it as well known as the Quick Meal cooking stove.

CURRENT HARDWARE PRICES.

AUGUST 1, 1888.

Note.—The quotations given below represent the Current Hardware Prices which prevail in the market at large. They are not given as manufacturers' prices, and manufacturers should not be held responsible for them. In cases where goods are quoted at lower figures than the manufacturers' name, it is not stated that the manufacturers are selling at the prices quoted, but simply that the goods are being sold, perhaps by the manufacturers, perhaps by the jobbers at the figures named.

THE IRON AGE

THURSDAY, AUGUST 9, 1888.

New Geared Press.

We present on this page an engraving of a new single crank geared press recently built by the E. W. Bliss Company, of Brooklyn, N. Y., and specially adapted for manufacturing heavy articles from sheet brass, iron and steel. The heavy

explain the action. Upon the shaft, which is of hammered steel, is forged an arm or projector, M. The balance-wheel takes a bearing on the outer end of the shaft at N, on which it runs loose, held in place by the end collar E. The hub of the wheel is enlarged on its inner side, as shown in Fig. 2, to cover the projection M on the

every time one of the steel shoes, H and I, passed over it. To obviate this a stationary shoe, L, is attached to a bracket bolted to the side of the press. This holds the pawl F clear of the wheel. The latch K is pivoted, as shown in Fig. 2, and can be thrown out sideways by a connection with the treadle. When so removed the pawl

Fig. 1.—General View.

NEW SINGLE-ACTION GEARED PRESS, BUILT BY THE E. W. BLISS CO., BROOKLYN, N. Y.

arch-shaped body is supported on an iron table, having strong frame legs. The slide has long adjustable bearings, and is provided with a steel binding cap to hold the shank of the punches. A shaft running in bearings on the back of the press frame is driven by pulleys 24 inches in diameter, and is provided with a fly-wheel to give steadiness of motion. On the opposite end of this shaft is a pinion which drives the large spur gear on the main shaft, and motion is communicated to the crankshaft at will by means of a new and very powerful clutching device connected with the treadle. Details of this clutch are given in Figs. 2, 3 and 4, on the next page. These clearly

show the action. The two sides of this projection are counterbored, and into these counterbores are fitted two steel pawls, F and G, which engage against steel shoes H and I in the enlarged hub of the balance-wheel, locking the wheel securely to the shaft in both directions. The arrangement for disengaging the pawls from the wheel is shown in Figs. 2 and 4. The pawls project beyond the hub of the wheel and are shaped as shown at F and G in Fig. 4. The pawl G rests upon a latch, K, and when in this position is held clear of the wheel, allowing the latter to turn freely upon the shaft. The other pawl, F, would not require any mechanism to hold it out, except on account of the click noise it would produce

G is thrown outward by means of a light spring, not shown, and engages against one of the steel shoes in the wheel, causing the shaft to revolve. As soon as the latter has turned a short distance the other pawl F is carried from under the shoe L and is allowed to engage in the opposite notch of the wheel, thus locking the wheel to the shaft both ways. When the shaft has made one revolution the outer end of the pawl G strikes the latch K (if the foot has been removed from the treadle) and throws the shaft clear of the wheel, allowing it to come to rest, as explained above. This makes a very powerful clutch, with small liability to derangement, and one which insures

great security in operating the press. A friction strap on the end of the crank shaft insures the stopping of the slide at the upper part of the stroke. The general dimensions of the press are as follows: Width between uprights, 32 inches; opening in bed, 14 x 18 inches, or as required by the work to be done; motion of slide 1 to 6 inches. The steel crankshaft is 5 inches in diameter, and the bearings are 10 inches long. The spur gear is 60 inches in diameter, with 6-inch face, and the ratio of gearing is $7\frac{1}{2}$ to 1. The fly-wheel is 45 inches in diameter, 6 inches wide and weighs 900 pounds. The total weight of the press is 10,500 pounds.

Tests of Homestead Steel.

Carnegie, Phipps & Co., Limited, of Pittsburgh, Pa., have printed a neat little pamphlet giving the records of 1057 tests of Bessemer and open-hearth steel in April and May, 1888, as made by the inspectors of the purchasers. Out of all the tests

strength and 20 per cent. elongation in 8 inches. For the Keystone Bridge Company 72 tests were made of 6 x 6 inch steel angles, the requirements being 30,000 pounds elastic limit, 56,000 pounds to 64,000 pounds ultimate strength and 20 per cent. elongation in 8 inches. Here, as in the other cases, the requirements were far exceeded. Among the other lots tested were bars and billets for the Union Bridge Company, the Edge Moor Iron Company, N. F. Palmer, Jr. & Co. and the Boston Bridge Company, the latter being placed. All this metal was Bessemer steel.

Among the open-hearth steel tests were a number of specimens for Government ship plate, calling for a tensile strength of 60,000 pounds and an elongation of 25 per cent.; also high boiler shell steel in which the requirements were 58,000 pounds to 67,000 pounds tensile strength, with an elongation not less than 20 per cent., and low boiler flange steel for the Government, in which the specifications were 50,000 pounds to 58,000 pounds tensile strength and 26 per cent. elongation.

the owners and capitalists and resulted in the above combination. The three mining companies are the Main Jellico Mountain Coal Company, the East Tennessee Coal Mining Company and the Jellico Coal and Coke Company. These corporations have been operating for some years, and have worked up a demand for the Jellico coal, which is of such superior quality and free from slate and clinkers as to bring in the markets even price with the Pittsburgh article. The combination will operate on a larger scale than the three mines collectively, and will now probably be able to meet demands. The directors of the consolidated company are Moritz Lippman, M. E. Thornton, J. E. Redfield, B. A. Jenkins, Chas. F. Johnston, Thos. Corcoran, W. N. Culp, St. John Boyle, Ed. F. Madden, several incorporators and directors being Eastern men. Louisville will be the headquarters, with sub-quarters in New York and Philadelphia. Besides the interests of the three companies the new corporation have purchased over 100,000 acres of mineral lands in Bell

Figs. 2, 3 and 4.—Details of Clutch.

NEW SINGLE-ACTION GEARED PRESS, BUILT BY THE E. W. BLISS CO., BROOKLYN, N. Y.

only three rejections were noted. Among the articles so tested were steel slabs for the Phoenix Iron Company, calling for an elastic limit of 30,000 pounds, an ultimate strength ranging from 58,500 pounds to 66,500 pounds, and an elongation of 20 per cent. in 8 inches. Out of the six tests the minimum elastic limit was 41,430, while the maximum reached 43,130, the highest ultimate strength was 66,440 and the lowest 60,760 pounds per square inch. The elongation fluctuated between the limits of 25.62 per cent. and 28.75 per cent. Ten tests of slabs for the same company in which the requirements were 32,000 pounds elastic limit and 64,000 to 70,000 pounds ultimate strength showed similarly excellent work. One hundred tests of steel bars, angles, billets and slabs were made for the Edge Moor Iron Company, in which the requirements were 35,000 pounds elastic limit 62,000 to 70,000 pounds ultimate strength and 22 per cent. elongation in 8 inches. For the Union Bridge Company steel for bars and angles was made calling for 40,000 pounds elastic limit, and 67,000 pounds to 75,000 pounds ultimate strength. For the Edge Moor Iron Company 121 tests of steel blooms, billets and slabs were made, for which the specifications were 30,000 pounds to 34,000 pounds elastic limit, 60,000 pounds to 68,000 pounds ultimate

Fire-box steel was made for the Baldwin Locomotive Works, the Pennsylvania Railroad, Baltimore and Ohio Railroad and the New York Central Railroad. There were also tests of marine flange steel for Dunham, Carrigan & Hayden Company, the New England Ship Building Company, the Atlas Engine Works and the Erie City Iron Works. For Ritter & Conley tank steel was made, for which the requirements were 60,000 to 65,000 pounds tensile strength, with an elongation in 8 inches of 18 per cent. Open-hearth bridge steel was produced for the Phoenix Iron Company, the Edger Moor Iron Company, the Massillon Bridge Company and the King Iron Bridge and Mfg. Company, the requirements varying considerable in the different cases. The tests throughout show an excellent metal, very uniform and generally far above specifications.

The United Jellico Coal and Iron Company, of Louisville, Ky., have been formed by the consolidation of three of the mining companies of the Jellico district. The scheme was devised recently by a coal man, who entered into correspondence with several Eastern capitalists. Coal experts were sent to Kentucky to thoroughly investigate the deposits, and on their favorable report negotiations were entered into by

Harlan, Knox and Whitley counties, and a large tract in Tennessee. The capital stock has been placed at \$6,000,000, the largest part of which has already been taken, and the balance will be put on the New York Stock Exchange.

The Pittsburgh Steel Casting Company have produced at their works a cast steel shell, the first ever made in the United States. Superintendent Hainsworth says a few hundred steel shells have been made in England, but they were cut from a forged ingot and then bored, necessarily making them very expensive. The shells which the Pittsburgh works are manufacturing are conical in shape, 6 inches in diameter at the largest and tapering to a point $2\frac{1}{4}$ inches, and weigh 95 pounds. Fifty pounds of powder will throw the projectile a distance of $6\frac{1}{2}$ miles and it will travel at the rate of 2000 feet per second. Mr. Hainsworth has experimented two years and is now confident that his shell will fulfill the expectations of the world. The Pittsburgh Steel Casting Company have received an experimental order for 500 shells, which will be followed by one of 2000.

General Duane is permanent chairman of the new Aqueduct Commission.

The Coke Fields of Connellsville, Pa.

From the *Connellsville (Pa.) Courier* we take the following interesting description of the Connellsville coke regions:

The famous coke region to which Connellsville has given a name and of which it is the geographical and business center is embraced in a long, narrow strip of land stretching away almost in a bee line from Latrobe, Pa., on the north, to Morgantown, W. Va., on the south, a distance of 50 miles or more. It varies in width from less than 1 mile to more than 5 miles, being widest in the vicinity of Connellsville, which is the basin, and averaging 2 miles. Its area is therefore approximately estimated at 100 square miles, or 64,000 acres. Fully one-fourth of this acreage has been worked out and another fourth consists of barren measures, leaving but 80 odd thousand acres of coal intact. Prices vary from \$200 to \$600 per acre, according to location, depth, thickness and pitch of vein, railroad facilities and surface advantages, but it is safe to place the average value at \$300 per acre, making the aggregate value to-day of the coal yet unmined in the Connellsville region at a round \$10,000,000. As the coal continues to be worked out, however, its value continues to increase. Though such increase in value has not been marked thus far because of the comparatively insignificant consumption until within a very recent period, it is now becoming quite apparent to the dullest mind, and the next decade will witness a decided advance in the price of coal lands. The most reliable data indicate that the coal supply will last about 40 years at the present rate of consumption. This contingency was foreseen several years ago by some of the largest operators in the region, notably the Connellsville Coke and Iron Company, and the H. C. Frick Coke Company, which firms have succeeded in securing an aggregate acreage equivalent to one-half the coal remaining in the coal region to-day. Though the prices paid were sometimes liberal to the point of extravagance, the wisdom and foresight of the investment is now generally conceded.

Though the Connellsville coke region embraces but a few thousand acres, its financial operations aggregate millions. Its average annual capacity is 5,000,000 tons of coke, valued at from \$5,000,000 to \$10,000,000 according to the mood of the coke operators and the tendency of the iron market. Last year coke remained at \$2 per ton for the better part of the year. To-day it is just one-half less in price. This ruinous reduction was inaugurated by a bad iron market, and completed by the failure to form anew the old coke pool, under which prices had been judiciously kept to a plane of reasonable profit by concerted action. There are 74 coke plants in the region, varying in size from 16 ovens at Great Bluff to 707 at Standard, and aggregating 18,047, which, together with the pit cars, larries, locomotives, tipples, tenement houses and other adjuncts, represent an outlay of \$6,000,000. The surface is worth another \$4,000,000. Thus it will be seen that this slender strip of Pennsylvania territory is worth the sum of \$20,000,000, or more than enough to build and equip the South Pennsylvania Railroad. The coal is taken out from drift, slope and shaft mines. Drift mining is the oldest, the cheapest and the easiest method, and slope mining comes next. Both are in the most general use, but shafts, though very expensive, have sometimes been found necessary. There are 12 shafts in the region, varying in depth from 50 feet at Morewood to 550 feet at the new Leisenring No. 3 works.

Estimated on the basis of figures taken from the books of one of the largest coke firms in the Connellsville region, the

amount paid out annually for labor, when the region is running full, is \$5,000,000, or an average annual wage for each of the 10,000 employees of \$500. But the frequent strikes and lockouts of last year greatly reduced these figures, and the present low price of coke has cut down the wage scales of last year from 15 to 25 per cent. During the boom in trade the average price for mining was \$1.05 per 100 bushels; now it varies from 75 cents to 90 cents. There is, in fact, no longer any uniformity in wages. Each operator is trying to get his work done as cheaply as possible in view of the ruinous price of coke. The H. C. Frick Coke Company pay the highest wages, based on \$1.35 coke, as follows: Miners, 90 cents per 100 bushels; coke drawers, 58 cents per 100 bushels charged, or from 60 to 75 cents per oven; other labor from \$1.35 to \$1.95 per day. Other employers pay as follows: Miners, per 100 bushels, 80 cents; coke drawers, from 55 cents to 70 cents per oven, and other labor from \$1.12½ to \$1.80 per day.

The Connellsville coal averages 8 feet in thickness, the maximum being 9 and the minimum 7 feet. There are 375,000 bushels of coal in an acre, but it is impossible to mine more than 300,000 bushels. The ovens are charged with from 110 to 140 bushels of coal and yield from 8 to 4 tons of coke every 48 hours, except those charged on Friday which burn over Sunday, making 72-hour coke. In order to restrict the output a general suspension of work for one and sometimes two days in the week is often observed, in which case 72-hour coke is the product two and three times in the week. This slowly burned coke has long been regarded as superior to the 48-hour product, but the notion is being exploded. Forty-eight-hour coke is now regarded equally good, if not better, for furnace purposes, while the 72-hour product is preferred by foundrymen. The ovens vary in size from 10½ to 12½ feet in diameter, the standard size now being 12 feet. Experienced coke makers question the wisdom of building them larger, saying that their observations lead them to the belief that the 12-foot ovens give a proportionately better yield than those larger. Pit wagons vary in capacity from 30 to 50 bushels, and the iron larries from which the ovens are charged from 120 to 190 bushels. The standard larry holds 130 bushels and the standard pit wagon 38½ bushels. Both are usually moved by mule power, but wire rope haulage is gaining much in favor, especially in the pit. At large works the charging is done by small locomotives which run on top of the ovens and haul several larries at a time. A great deal of water is used in cooling down the glowing coke when it is pulled from the oven, and the lack of it has often been severely felt by more than one operator during the dry season. Thos. Lynch, Superintendent of the H. C. Frick Coke Company's works, estimates the consumption at those works at 600 gallons per oven daily. At this rate it would require 7,500,000 gallons per day for the region. But the Frick company have a water-works of their own, supplied from the Yough River, and their consumption is therefore not limited, so that more water is probably used at these works than at others where the supply is scarcer.

Three trunk line railroads penetrate the coke region and grow fat upon its immense and immensely profitable tonnage. The rate from the region to Pittsburgh alone is now 80 cents per ton and has long been \$1. It is safe to say, therefore, that the Southwest Pennsylvania, the Baltimore and Ohio's Pittsburgh division and the Pittsburgh, McKeesport & Youghiogheny railroads divide not less than \$4,000,000 annually for tonnage from the region, while the main lines to which they are but

feeders earn many millions more in carrying this coke to the Eastern and Western markets. There are 8000 cars employed in the coke trade, over 8000 of which are individual cars, and these branch railroads alone give employment to several thousand additional men.

Coating Metal Plates With Tin.

A patent has recently been granted in England for a process of coating metal plates with tin which possesses certain features of interest. The inventor, we presume, was instigated by the complaints concerning pin holes in tin plates, which trouble is generally ascribed to the imperfect washing, which allows enough acid to remain to corrode the plate after coating. The principal object of this invention, however, as stated by the patentee, is to reduce the amount of dross which is occasioned by passing the wet plate through the bath of molten tin. The wet plates, according to this method, after being taken out from the acid pickling bath, are washed or swilled with an alkaline solution for the purpose of removing every trace of acid. This neutralizing solution consists of a mixture of ammonia and palm oil. The next step in the process to which the plates are subjected is passing them through a series of rollers. The first pair of rollers are of metal, and are used to flatten and straighten the black plates. The second pair of rollers are of India rubber or of some other soft material, which squeezes off the moisture on both sides of the plates, and the final pair through which the plates are passed are kept coated with grease. After passing through this series of rolls the plates are dipped in molten tin and treated in the usual manner. The two features especially noticeable in the above process are the use of an alkaline solution and the soft rolls for drying the plates, though we are not positive that this is the first time that the former has been applied.

Announcement is made of the formation of the Redstone Coal and Coke Company, at Uniontown, Pa., with a capital stock of \$50,000. It is composed mainly of Philadelphia capitalists. Jacob E. Ridgeway, of Philadelphia, is president, and George Douthett, of the same city, is secretary and treasurer. The Board of Directors are as follows: Jacob E. Ridgeway, General Lauffer and Dr. Brown, all of Philadelphia, Col. A. L. McFarland and F. C. Shallenberg, of Irwin; James McKay, of Pittsburgh, and Samuel S. Graham, of Brownsville. The company own 3300 acres of coal land on the line of the Pittsburgh, Virginia and Charleston Railroad, and have recently purchased the Parkhill mill property, consisting of 46 acres of surface, on which a plant will be erected for the mining and shipping of coal on a large scale. A shaft will be sunk and a few coke ovens built to utilize the slack. The attorney for the company states that operations will be begun at once to open up the territory.

The new gas plant of Henry Disston & Sons, at Tacony, Pa., to which we referred at some length in *The Iron Age* several months ago, was started last week. The plant has cost over \$40,000, including holders and pipes, and is intended to supply with fuel, not only the great establishments of the Disston's, but any other of the manufacturing concerns in the neighborhood which may wish to use it.

It is of general interest to note that the Pennsylvania Railroad Company intend trying one of the Webb compound locomotives for their fast passenger traffic. We understand that an engine has been finished at Manchester, England, and is ready for shipment. The experiment will no doubt be attentively watched.

The Rich Hill Fire-Damp Explosion.

Under date of June 9 Oscar Kochtitzky, Commissioner of Labor Statistics and Inspection of Missouri, has submitted a special report to the Governor of that State on the investigation of the mine explosion at Rich Hill, Mo., on the 29th of March, 1888, in shaft No. 6 of the Keith & Perry Company's coal mines, by which 23 persons were killed and a large number injured. The report in question is accompanied by reports of Hon. M. L. Wolf, State mine inspector; by Prof. W. B. Potter, mining engineer of the Washington University, St. Louis, and Messrs. E. A. Scammon and Robert Craig, experts. Practically they all agree in the verdict formulated by Professor Potter, whose report contains the principal features. The mine was thoroughly equipped with machinery for ventilation, was properly opened up, and seems to have been under very careful officers. The famous disaster, from the testimony submitted, was due principally to the use of excessively heavy shots in the system of getting the coal without under-cutting, and entirely by blasting in the solid. It seems that contrary to orders three very heavy shots were put into one heading, which caused certainly one and possibly more to blow out. This led to an explosion, in which the coal dust of the dry mine must have played an important part. Professor Potter has made a series of analyses of the lump, nut, pea and dust coal which showed that the proportion of volatile matter, even in the lump coal, is quite large, and that the fine dust is nearly one-third of its weight of volatile matter, notwithstanding the large increase in the proportion of the incombustible mineral matter or ash. After the first explosion the ventilating system was stopped, and the concussion of the explosion, and possibly the few shots fired subsequently to it in other rooms, as well as unburned gas accumulated in the workings, brought about a second explosion, which killed some of the men who had escaped the first disaster. The system of mining seems to have been extremely wasteful of powder, 337 kegs of 25 pounds each being used during the month of March in producing 6340 tons of coal. This is equivalent to an average of 18.81 tons of coal per keg of powder, while the average for the whole State in 1887 was 82.12 tons, and in St. Clair County, Ill., 194.3 tons. Professor Potter urges that the mining laws be modified so as to prohibit this system of getting coal by working in the solid without under cutting, and concludes his report by stating that in his judgment the disaster was due to criminal carelessness on the part of the miners, and a persistent use on their part of methods of getting the coal which cannot be too severely condemned, and which, from the evidence submitted, seems to have been contrary to the rules and regulations of the officers of the company.

From a recent issue of the Beaver Falls, Pa., *Tribune*, we take the following information regarding the industries at that place: "The hammer department is the only department running at the Beaver Falls Steel Works, and it is doubtful whether it will be enabled to shut down or not, orders are so pressing. The rest of the mill is being put in good repair. At the Penn Bridge Works a number of carloads of iron have been received and the full complement of men are working. The firm have a large number of orders on hand. The Hartman Manufacturing Company have got settled down in their new quarters, and everything is running very smoothly. Orders for wire picket fence continue to pour in, also for wire mats. The saw works of Emerson, Smith & Co. still continue to run full handed on ten-

hour time. Orders very fair. At the shovel works of H. M. Myers & Co. the rolling mill department is running on double turn, and the balance of the work on single turn. The axe works of Hubbard & Co. are running on full time in every department."

New Caliper Gauge.

Messrs. Tickell & Dyson, of Cleveland, Ohio, are putting on the market the new caliper gauge shown on this page.

The engravings clearly explain its arrangement. The gauge is specially designed for measuring recesses, in doing which the taper pin, as shown in Fig. 2, is pulled out and the tube H is slid outward until the opening, marked 3, registers

Fig. 1.—Elevation.

Fig. 2.—Section.

New Caliper Gauge, Made by Messrs. Tickell & Dyson, Cleveland, Ohio.

with the opening in the case through which the transverse pin is passed. This pin locks the tubes together. The arm R is then drawn out until the point comes in contact with opposite side of the recess to be measured, and is clamped by the nut S. Fine adjustments can be made by means of the nut M, which is provided with an index moving over a scale, as shown. In order to remove the gauge from the recess the stop pin is withdrawn and the tube H moved inward in the outer tube A, so as to shorten the gauge and permit its easy removal. The tube H can then be moved out in the tube A until the openings in them register as before. The stop pin being then inserted the gauge will indicate the exact diameter as before.

Fig. 1 is a front elevation showing the slot and the finger which is attached to the inside tube H and is adapted to sweep over the scale, moving in the longitudinal slot. The finger registers exactly with the holes 1, 2 and 3, Fig. 2. Every one of the divisions swept over by the index on the nut M represent $\frac{1}{1000}$ inch longitudinal motion of the gauge rods. The gauge will be made in sizes ranging from 2 to 40 inches.

Pumping Oil Long Distances.

The grand experiment of pumping crude oil from Lima, in Ohio, to Chicago, a distance of 206 miles, is being practically tested, and the result will be known perhaps to-day, when the flow of oil, which is traversing the pipes at the rate of 20 miles a day, is expected to be announced. The preliminary test made with water gave promise of success. The longest distance which oil has been piped heretofore is 87 miles, from Bradford to Buffalo, but, as it appears to be necessary only to add to the number of intermediate pumps to correspond with the distance covered, the indications are that oil-pipe lines can be indefinitely extended, unless intervening mountains or streams present an insuperable barrier.

The proposition to pipe gas from the interior of Pennsylvania to New York City was generally regarded as wholly chimerical, but since then views have changed to conform to established facts. Oil for fuel purposes in Chicago, if available in adequate supplies, will have a deep significance not only as bearing upon the industrial interests of that but other cities. If a barrel of Lima oil is the equivalent of 1 ton of coal, and can be provided at 60 cents for that quantity, it will become necessary to revise calculations respecting the costs of manufactured products.

Plea for the American Ship.

An earnest plea for the American ship is made by F. J. Babson in the *Marine Journal*. He says:

From the launching of the iron propellers on the Clyde dates the decline of the American ocean marine. The first cost of iron vessels in 1845 was \$100 per ton in Great Britain, and in 1887 it had been reduced to \$50 per ton, and some were built for \$40. The same disparity exists in favor of England in the cost of iron ships that insures to the United States in wooden ships. The shipbuilders of the United States have grappled with this problem with a skill and perseverance that deserves better consideration than has been awarded it. They have reduced the cost of first-class iron ships from a cost of \$100 per ton in 1850 to \$65 in 1884.

The American shipping interests find themselves confronted by a majority of the House of Representatives that propose to destroy American shipbuilding by passing the Dunn Free Ship bill by which English owned ships can, by the whitewashing process, be placed under the American flag and without the actual purchase of a single vessel but merely by the transfer process will completely neutralize and destroy the building of iron ships by American mechanics. Our coasting trade and coast lines of steamship transportation that since the formation of the Government have been protected from foreign invasion will also be open to the competition of British built and British manned vessels under the same process, and the fisheries share the same fate.

Great Britain has 17,000,000 tons of shipping of all kinds. The United States has 4,000,000 tons, of which 3,000,000 is domestic or coasting tonnage. Great Britain must of necessity develop her power and wealth by means of the ocean. She will subsidize to the last dollar to keep every ton of her shipping afloat, nor will she scruple at any means to take possession of the trade of any country.

An employee of the Aetna Iron and Steel Company, of Bridgeport, Ohio, has gotten up a device which enables rolls to be dressed in the housing without decreasing the speed of the engine so as to necessitate the closing down of the departments connected with the power.

Steam Feed Engine for Sawmills.

The Filer & Stowell Company, of Milwaukee, Wis., have recently made some improvements in their steam feed engines for sawmill use, the latest design being shown in the engravings on this page. The engines are of the oscillating type, and hence have no links or eccentrics to slip or get out of order. The first feed of this general design was placed in the mill of Messrs. R. J. Brent & Co., Pensacola, Fla., nearly three years ago, handling a 60-foot carriage. The engines have a smooth, uniform motion, are easily controlled, and economical in the use of steam. The cut illustrates a size designed especially for

*Improved Steam Feed Engines for Saw Mills,
Built by the Filer & Stowell Company,
Milwaukee, Wis.*

the Pacific Coast. With this the carriage may travel to suit length of any log up to 150 feet.

Electric Launches.—A novelty seen in New York harbor a short time ago was a trim little pleasure boat, 28 feet by 6, driven by electricity. But unfamiliar though it may be on this side of the ocean, this motor has more than once been used for small boats. Several years ago a launch was fitted with electric motors on the Thames, and made many trips there, carrying a large number of passengers. Soon after, at the Vienna Exposition, either this same craft or another of English make, plied constantly in pleasure trips, working to general satisfaction. An electric boat was then built by Yarrow & Co. for the Italian torpedo service. It was 36 feet long by 6½ feet beam, its propeller being driven by a duplex Reckenzaun motor, and it achieved a speed of about 8½ miles. It was put in service at Spezzia. This vessel was surpassed in celebrity by the volta, which first achieved the distinction of a trip across the British Channel and back, between Dover and Calais, a distance of about 24 miles each way. The Volta was about 37 feet long by 7 feet beam and 3½ deep, and had a battery of 61 cells. It could be worked by a single person by simply turning an iron handle to the right or left for steering

while this switch also started and stopped the vessel. Practically the same arrangement is found in the launch used in New York harbor. The time has not come, of course, for any general substitution of electricity for other motors on shipboard. Nevertheless, there are certain advantages in the electric launch that may gradually increase its use, especially for specific purposes.

The Navy.

If all the vessels provided for by both Senate and House bills are agreed to in conference and their building will be authorized, the foundation of the new navy will stand about as follows:

One sea-going armored turret ship of 7500 tons, carrying four 12-inch guns, and developing a speed of 17 knots. The armor will be made up of 16-inch steel plates.

One armored rigged cruiser of 6600 tons (the Maine, building at New York), to carry four 10-inch guns in revolving turrets and six 6-inch guns in broadside mounts.

One armored turret ship (the Texas, building at Norfolk), about 6600 tons, carrying two 12-inch guns in revolving turrets, with six 6-inch guns in broadside mounts.

One 5300-ton protected cruiser, of the Reina Regente type, in pending bill, and carrying four guns either 8 or 10 inch—which has not yet been decided—and eight 6-inch guns, capable of steaming 20 knots an hour and having a maximum coal capacity of 1200 tons.

Five steel cruisers, all now building and heretofore fully described—viz., the Newark, Philadelphia and Baltimore at Cramp & Sons', and the San Francisco and Charleston at San Francisco.

The aggregate armament of the above-named vessels will be 54 guns, mostly 6-inch, with powerful secondary batteries.

Two steel cruisers in the bill now pending of 3000 tons each, to have 19-knot speed, each armed with main batteries of six 6-inch guns, but to have also secondary batteries of extraordinary power.

The steel cruisers in the bill now pending of 2000 tons displacement, speed not specified in the law, but probably not under 18 knots, main batteries of six 6-inch guns and also heavy secondary batteries. They will probably have a light three-masted schooner rig, similar to the Yorktown.

Three 1700-ton gunboats are the Yorktown, nearly completed at Cramp & Sons' yard; the other two, the Concord and Bennington, about four-tenths completed at Roach's old yard, Chester, under the management of Mr. G. W. Quintard and N. F. Palmer, Jr. These vessels will have a speed of about 16 knots and carry six 6-inch guns and suitable secondary batteries. The Bennington and Concord will be in the water about the close of the year.

The Petrel, building at Baltimore, has about 870 tons displacement, is six-tenths done, and, it is expected, will soon be launched. She will carry four 6-inch guns.

In addition there is the dynamite cruiser ready for trial next month, and the torpedo boat Stiletto, built by Herreshoff; two submarine torpedo boats, recently bid for by Cramp & Sons, and which bids are now under consideration, two single-turreted monitors of about 3500 tons displacement, to carry each one 16-inch 110-ton gun in a revolving turret, together with one pneumatic tube in the bow to be capable of discharging an aerial dynamite torpedo containing a charge of ¼ ton of the highest explosive. The designs for these two vessels are now being finished in the Bureau of Construction in the Navy Department, and bids for them will shortly be called for.

The Motive Power of the World.

The statistical office of the German Government has recently published some interesting particulars on the present state of mechanical power, from which we select the following: Four-fifths of the engines working at present have been built during the last 25 years. The total steam-engine power of the United States represents 7,500,000 horse-power; of Great Britain, 7,000,000; Germany, 4,500,000; France, 3,000,000; Austria, 1,500,000. In these numbers the power of locomotives is not included; these number 105,000, and represent a total energy of 3,000,000 horse-power. This, added to the other engines, produces a total of 46,000,000 horse-power for the entire globe. Taking an engine horse-power as equal to the power of three actual horses, and a horse as equal to seven men, the steam engines of the earth equal approximately the laboring power of 1,000,000,000 of men, which is more than double the entire working population of the earth. The total population of the globe is calculated at nearly 1,500,000,000, two-thirds of which, including children, are not engaged in any mechanical work at all. We must, however, take into consideration that the use of steam-power is up to the present almost exclusively in the hands of Europeans and their descendants in the New World, and that Asiatics, who form by far the greater part of the earth's population, up to the present hardly use it at all. Bearing this in mind, we shall not be far out by concluding that the mechanical power of Western nations has been increased six-fold by the invention of the steam engine, while the productiveness of this power in manufacture has been further increased by all kinds of manufacturing machinery.

A Colorado Line of Two Feet Gauge.

—The experiment of building a railroad of 2 feet gauge was undertaken a few years ago in Massachusetts, but the road (the Billerica and Bedford) was not a financial success, and the rails and rolling stock were removed and laid down in Maine, where a line of some length is now in operation. The first road of this miniature gauge in the West has just been opened in Colorado, running some 10 miles from Black Hawk into a mountain mining region. The average grade is about 190 feet to the mile, reaching in some places as much as 264 feet; and curves as short as 90° are operated. The largest locomotive, with tender loaded with fuel and water, weighs only 20 tons, and another is half that weight. This little road carries a good deal of ore, and is expected also to develop a considerable excursion traffic.

J. H. Ralston has submitted to John A. Kruse & Co., of Chicago, a report on the iron ore deposits of Marion County, Texas, which is printed in the Texas *Iron News*, of Jefferson. Mr. Ralston figures the cost of charcoal iron at \$12, putting 50 per cent. ore in at \$1.50, 110 bushels of charcoal at 6 cents a bushel, limestone 75 cents, and salaries and labor at \$1.05. An analysis by Chauvenet & Blair, of St. Louis, shows the ore to contain 63 per cent of iron, 5.45 per cent of silica, a trace of phosphorus, and 0.53 per cent. of sulphur.

The Tamarack-Osceola Copper Mfg. Company, Dollar Bay, Mich., will erect two wire mills. There will be two buildings, 100 x 50 feet each, joined together at the ends, with an open court between. The capacity of the wire mills will be 10,000 pounds of fine wire per day of ten hours, or 20,000 pounds when working day and night.

Cost of Mining Iron Ore.

Gogebic and Menominee.

Last year Mr. George W. Maynard, of New York, made a thorough examination of a number of properties on the Gogebic and Menominee ranges. The very elaborate report contained a number of statements of cost of mining which are of particular interest, since they give actual figures. They show how many items enter into cost which those not familiar with mining work do not think of including.

Cost at Iron King, July, 1887.

Explosions.....	\$35.75
Fuel.....	402.85
Oil and waste.....	48.75
Timbering.....	2,932.71
Mining.....	9,084.37
Interest and discount.....	1.56
Assay.....	60.00
Office expense.....	43.65
Teaming.....	555.27
Landing and Trammings.....	404.75
Surface labor.....	538.83
Blacksmithing.....	203.74
Holsting and pumping.....	918.37
Captain, bosses and clerks.....	346.25
Management expense.....	33.56
Total.....	\$16,220.41

9976 tons mined, \$1.626 per ton.
Total mined to July 30, 62,247 tons, \$1.896 per ton.

Mr. Maynard gives costs, also, for the Kakagon Mine, but, as they were for an exceptional period, when nothing but extraction work was going on and no outlays were being made for development, we omit them.

The following figures deal with the cost at the Iron River Mine, in the Menominee region.

Cost at Iron River, Menominee:

	Labor cost.		Total cost. Dec., 1885, to Dec., 1886.
	Dec., 1885, to Dec., 1886.	Dec., 1886, to Dec., 1887.	
Mining.....	\$0.561	\$0.342	\$0.715
Surface.....	.107	.149	.106
Sinking.....	.062	.157	.063
Drifting.....	.036	.142	.062
Isabella.....423
Teaming.....	.010	.021	.016
Engine No. 1.....	.029	.057	.111
Steam Pumps.....	.012	.021	.024
Car pen- ter shops.....	.055	.071
Blacksmith.....	.016	.025	.034
General ex- penses.....	.025	.029	.040
Fuel.....	.009	.052
Filling and timbering.....	.066
Sundries.....064
Total.....	\$0.978	\$1.738	\$1.284

Supplies.	Dec., 1885, to Dec., 1886.	Dec., 1885, to Dec., 1886.
	to Dec., 1886.	to Dec., 1886.
Steel.....	\$0.027	\$0.126
Explosions.....	.003
Oil.....	.087	.132
Wood.....	.003
Coal.....	.009	.027
Lumber.....	.007	.021
R. R. supplies.....	.015	.019
Total.....	\$0.149	\$0.325

From December, 1885, to 1886, the total labor cost was \$77,550.65, the tonnage mined being 78,590 tons. The number of days' labor was 37,319, so that 2.111 tons of ore were mined per day's labor. In 1886-87 the labor cost was \$89,938.20 on 51,901 tons of ore, the cost of supplies in the two years being \$11,683.13 and \$16,873.50 respectively. In July, 1887, the labor cost on 14,399 tons was 84.3 cents, while the total cost was \$1.204. For the first eight months of 1887 the total cost was \$2.426. The Iron River pays a royalty of 30 cents per ton. From December, 1886, to July, 1887, both months inclusive, the Florence mine, also on the Menominee range, mined 47,263 tons, at a total cost of \$82,963.39, or \$1.75 per ton, this including dead work estimated to be sufficient for getting out 80,000 tons of ore. What effect a small amount of dead work has is shown by the fact that in the month of August, 1887, the total mining cost was

90 to 95 cents a ton. The company own three-quarter interest and pays 6 cents royalty on the other quarter.

For the Youngstown mine, like the two preceding, producing non-Bessemer ores, the cost for the period of May 1 to December 31, 1886, was as follows:

Cost at Youngstown Mine.

Mining.....	\$0.778
Surface labor.....	.052
Sinking.....	.021
Drifting.....	.061
No. 1 engine.....	.143
Steam pumps.....	.034
Depreciation and repairs of buildings.....	.069
Cars, skips and derricks.....	.020
General expense.....	.040
Carts, wagons and sleighs.....	.001
Teaming.....	.002
Shaft houses and skip roads.....	.006
Boarding house equipment.....	.001
Portable machinery.....	.001
Machinery.....	.009
Wire rope.....	.001
Railway supplies.....	.002
Taxes.....	.026
Credits by explosions, steel supplies, &c.....	\$1.230
Royalty.....	\$1.15
Freight to Escanaba.....	.25
Escanaba to Cleveland.....	.85
Commission.....	1.35
Insurance.....	.05
Selling at Cleveland.....	\$3.6575
Profit.....	\$4.25
Profit.....	\$0.5025

These figures taken from the books of companies will convey a clearer idea of costs than the usual rough estimates, which are generally too low.

The Economy of Naphtha Engines.

Bearing further upon the performance of naphtha as a working fluid in engine cylinders, to which we have of late referred several times, is an article contributed a few weeks ago to our British contemporary *Industries*, by G. R. Bodmer, and entitled "Petroleum Vapor Engines." Mr. Bodmer, after a mathematical analysis by which he shows that there is nothing in the general principles applying to the action of heat engines worked by vapor to account for the superiority of petroleum spirit over steam in the matter of economy, says:

The two chief sources of loss in the production and utilization of steam power are, first, the waste of fuel in the generator, and, secondly, the condensation of steam before the cut-off takes place on its admission to the cylinder. Any marked improvement in the performance of a given engine is, in all probability, due to a reduction in one or both of these losses, and if, therefore, a motor when using petroleum spirit is more economical than when using steam under otherwise similar conditions, the natural inference would be that the generator is more efficient for the production of petroleum vapor than for that of steam, and that the initial condensation in the cylinder is less for the former than for the latter. In a small engine, such as that with which Mr. Yarrow's trials were made, there is plenty of room for improvement under both heads when working with steam. It is not at all unlikely that the boiler when used simply as a steam bath for heating the coil through which the petroleum spirit was circulated was more efficient than under ordinary conditions. Owing to the fact that only about one-ninth of the quantity of heat was required to evaporate a given weight of the fluid, the circulation in the tubes would be very rapid and favor the more effective utilization of the heat supplied; but it is probably to a reduction in the initial cylinder condensation that we must look as the chief source of improvement.

To perform a given amount of work a much greater weight of petroleum spirit vapor than of steam at the same temperature has to pass through the engine. As-

suming the efficiency to be twice as great with petroleum vapor as with steam, the proportion of the former to the latter required would be $4\frac{1}{2}:1$, the heat of evaporation being taken as one-ninth that of steam. The initial pressure of the spirit vapor is about one and a half times that of the steam at the same temperature, and, roughly speaking, therefore, with the same expansion ratio, the work done in the cylinder per stroke will be about one and a half times as great with spirit vapor as with steam, and consequently the weight of the vapor admitted at each stroke $4\frac{1}{2} \times 1\frac{1}{2} = 6.75$ times that of the steam. The surface of the cylinder walls concerned in producing initial condensation is the same per stroke in both cases, and at a given speed the time of exposure would be equal. The rate at which heat is transferred from the petroleum spirit vapor to the cylinder metal must therefore be much less than for steam, in order to account for the observed greater economy. It is well known that the rate of transmission of heat through a plate of, for instance, cast iron, from one fluid to another, varies considerably according to the nature of the latter; but no data are available on this point with regard to petroleum spirit or similar vapors. That such substances would, however, part far less readily with their heat than wet steam seems highly probable, and the film of the condensed spirit once formed upon the surface of the cylinder walls must act as an effective non-conductor, whereas a similar film of water would facilitate the transference of heat. If it be assumed that the quantity of heat abstracted by the walls of the cylinder, in a given time and for a given exposed area, with a certain range of temperature, is the same whatever be the vapor used, then there would still be an advantage in favor of the petroleum vapor, on account of the greater quantity of work done per stroke—that is to say, the condensation would be, approximately, no greater for $1\frac{1}{2}$ horse-power with vapor than for 1 horse-power with steam.

In the absence of detailed particulars it is, of course, impossible to come to any definite conclusion as to the causes of the reported superior economy of the Zephyr engine; and for this purpose it would be necessary to know, not merely the quantity of petroleum spirit circulated in the generator per indicated horse-power per hour, but also the specific volumes of the vapor at various pressures, so that the amount of condensation at any point of the stroke could be determined in the same manner as has been done in the case of steam. One other point, which very possibly tells in favor of petroleum spirit, may in conclusion be mentioned. It is very generally believed that in steam engines the re-evaporation of a film of water adhering to the walls of the cylinder, on connecting it with the condenser, is largely instrumental in cooling down the metal, and thus causing subsequent initial condensation. If we assume a similar phenomenon to occur with petroleum vapor, it is tolerably certain that the adhering film of liquid cannot be thicker than in the case of steam; and as its specific gravity is less than that of water, the actual weight of the film must also be less. The heat of evaporation, however, is only about one-ninth that of steam, so that less than one-ninth of the cooling effect occurring with steam is produced by the re-evaporation of the film of petroleum spirit on the cylinder metal, and the capacity of the latter for subsequently absorbing heat is proportionately less.

At a meeting of the board of directors of the Decatur Car Wheel and Mfg. Company, on July 28, the resignation of E. B. Tippet as vice-president and general manager was accepted.

THE WEEK.

The Memphis Bridge across the Mississippi River, according to the final decision of the Secretary of War, will have a channel span of 730 feet. Capt. Haastick, President of the St. Louis barge line says, so narrow a span will cause irreparable injury to the grain trade of the river above that point, on account of the increased cost of transportation, and that if four or five such bridges should be built between Cairo and New Orleans the Government might as well discontinue the improvement of the channel.

The progress of factory inspection in this city is not satisfactory to the Working Woman's Society. Miss Van Etten, who presided at a recent meeting, said that, as shown by the figures of Chief Inspector Connolly, only 800 out of the 12,500 factories located here have been inspected within the last three months. The remainder of the work she thinks will be done within about 30 years.

The principal manufacturers of jute bagging in the United States are said to have combined to control production, at the same time advancing prices from about 7 cents to 11½ cents per yard. The output of the mills is 50,000,000 yards, sufficient to cover a crop of 7,000,000 bales of cotton. There is no scarcity of material. Referring to this "bagging squeeze," the *New Orleans Times-Democrat* says, the result must inevitably be an enormous loss to cotton planters, unless they can devise some means of effectually dealing with the crisis, and to provide against further losses planters are told to take warning by raising the material for covering their own cotton. A jute factory in New Orleans was compelled to close for want of the raw material.

The Mexican authorities are hard at work on the banks of their side of the Rio Grande, building wing dams and willow mattresses in order to protect their territory from being washed away by the turbulent river to the same extent as it has been in former years. They advise Americans on the opposite side to protect themselves in like manner.

Commodore Sicard, Chief of the Bureau of Ordnance, reports that, so far as the work of that bureau is concerned, the new cruiser *Boston* will be completed September 1, the *Atlanta* November 1, and the *Chicago* January 1. The Bureau of Construction and Engineering are equally advanced. Secretary Whitney has given instructions for the rapid completion of the work.

The annual statement of the Bureau of Industrial Affairs of Pennsylvania, just published, shows that the coal mined in 1887 in the six anthracite coal districts of the State exceeded 33,000,000 tons, exclusive of 2,000,000 used in and about the mines, which is the largest output ever known. The number of employees is 98,840, of whom about 38,000 are actual miners. In the bituminous district there are 58,000 persons, of whom 47,089 are employed inside the mines. The average value of the coal, loaded on cars at the mines in the crude state, was about \$1.25 per ton. The value of the coke is set down at \$1.75 per ton at the ovens. The wages paid for mining averaged about 45 cents per net ton.

The newly appointed Minister Plenipotentiary from Persia to the United States will arrive at New York with his suite about the middle of August. His name is Hadji Hosseim Kouli Khan Mohamed el Vesari.

An alleged discovery of tin in the State of Durango, Mexico seems to have little foundation in fact. The president of the

St. Louis Stamping Company, some two years ago, accompanied by an expert, also by Professor Potter, of Washington University, examined thoroughly every tin mine in the State, and, after spending \$25,000, became satisfied that no profit from that source is possible. Admitting that tin exists, neither water nor coal is to be found in the district, and the nearest railroad is 300 miles distant.

The largest of three great cables for the Fifth avenue Traction Railroad, in Pittsburgh, has arrived at its destination from Robeling's, the manufacturers, in Trenton, N. J. The reel is 10 feet in diameter, 9 feet 6 inches in depth, and weighs nearly 50 tons. The wagons specially provided to receive it were double trucks on 16 wheels, and are each 12 or 13 feet in length. The axles are of steel, 4½ inches square and 5½ feet long. The total weight of the wagons alone is about 18,000 pounds. The weight of the wagons and proved to be so unmanageable that the wagons were finally abandoned.

The Reading Railroad management propose to construct two bridges across the Lehigh River at Allentown, connecting the East Pennsylvania Railroad with the New Jersey Central.

Chief Arthur, of the Brotherhood of Locomotive Engineers, has called a general meeting of that body in St. Louis on August 9. Matters of supreme importance to the Brotherhood are to be decided, among others the recent action of the St. Joseph convention of engineers, firemen, switchmen and brakemen who decided upon a plan of federation, and also on the "Q" strike.

Convicts throughout the State were interrupted in their work August 1 through the operation of the new prison bill. At Elmira 800 young men in the reformatory who had been employed on light hardware and like industries were suddenly consigned to idleness. At Sing Sing an inventory of the effects in the shops is being taken preparatory to a sale. At Albany Perry & Co., the big stove founders, are putting their shops in order, and molders claim that they will soon employ between two and three hundred more men than before.

An engineer on a ferry-boat at Philadelphia fell senseless at his lever from an attack of vertigo, and the boat was driven into the pier with a fearful shock. His only possible assistant was attending to the fires in the hold.

New Orleans expects to receive abundant supplies of cheap coal a year hence from Alabama, when the Tennessee River is more fully opened to navigation by the removal of mussel shoals.

Ex-State Senator Lew Emery, of Bradford, Pa., has large grain elevators in Northern Dakota, and a big flour mill on the St. Joe River in Michigan. Speaking of wheat-growing localities, he said: "The northwestern portion of the United States is destined to become more and more the great wheat-raising country. I have given this subject considerable attention, and have visited Russia twice. I examined the great wheat districts of the Czar's empire, and I noticed that the subsoils are about the same as those found in Northern Dakota. The major portion of the wheat crop is raised in the latitude north of 45°, and very little below this. The interior of Russia appears to me to have been at one time a vast inland sea. The peasants have cut canals through the land to the Baltic and Caspian Seas, and by the aid of the rivers we have the spectacle of vessels practically going through the land, bearing the crops of wheat to these larger outlets. The point I wish to make, however, is this, that weevils, bugs, grubs,

worms, &c., never infest the wheat in latitudes north of 45°, while south of this line the uncertainty of the crop from these causes makes wheat-growing profitless. Wheat can be raised in Dakota for 40 cents per bushel, but it cannot be done in warmer latitudes for less than 80 cents. Wheat can be successfully grown as far north as 150 miles above Lake Winnipeg. For this reason, I think, wheat raising will be given over to the farmers of the Northern United States sooner or later."

The introduction in this country within the last four years of the "Hungarian process"—that is, the use of rolls in flour manufacture, enabled mills to nearly double their capacity, at the same time stimulating the building of new and extensive mills, so that profits have been as low as 2½ cents per barrel, and are still on a very narrow margin.

All the American consuls in Italy will be represented at a meeting to be held in Milan this month, to devise means for the promotion of commercial relations between Italy and the United States.

The United States Senate have adopted a resolution for the appointment of a committee to report upon the relations of commerce and business existing between the United States and the British North American Possessions. The resolution instructs the committee to inquire particularly as to the effect upon the commerce and carrying trade of the United States of the Canadian system of railways and canals.

The machinery for Mr. Spreckles's sugar refinery, in Philadelphia, will be the largest in the world of its kind, and Pittsburgh manufacturers, who are already experimenting with a large centrifugal machine under his direction, are anxious to secure a contract. It is stated that Mr. Spreckles's order for machinery, when given, will amount in round numbers to some 50 steam engines to run sets of the centrifugal apparatus. There is a possibility that this number will be increased to 100 engines.

To what extent the transactions of the commercial exchanges in Illinois may contravene the gambling laws of the State is a question that agitates the people of Chicago. The District Attorney is inclined to believe that some of them are illegal, but it is surmised that the Chicago Board of Trade will take such action as will avert the interposition of the courts.

The United States Consul, at Tokio, shows that the decline in United States exports to Japan in 1887 was almost solely due to the falling off in the exports of kerosene, and intimates that the deficiency could be fully made good by preparing expressly for that market a class of cheap cotton goods weighing 9, 8, 7 and even less pounds to the piece, now supplied almost exclusively by England, as are the cheap woollens, only to a less extent.

The Washington ordnance factory is being worked up to its full capacity. A second 10-inch gun is now ready for testing and a third will be finished before winter, in addition to 30 or 40 6-inch rifles, of which about one-third are practically finished. The chief interest centers just now in two steel-cast guns in process of completion, departures into a new field. One of these is made of Bessemer and the other of open-hearth steel. The former is the more advanced, having been fully rifled and so far completed that it is likely to be ready for trial by September. This gun is the one made by the Pittsburgh Company, and cast last January. Superintendent Hainsworth not only at that time, but after its rough boring, and indeed through every process pronounced it a most successful example of what could be

done by casting. The test by firing will be watched with eagerness, as steel-cast guns can be furnished far more cheaply than built-up guns. The cost of a built-up 6-inch breech-loader, which weighs 11,000 pounds, is about \$7750; that of an 8-inch breech-loader, weighing 28,850 pounds, is about \$16,880; that of a 10-inch gun whose weight is 57,485 pounds is \$20,420.

Railway extension projects are active in the far northwestern country. Aside from the talked-of arrangement between the Manitoban Provincial Government and the Northern Pacific Railroad Company, there is a scheme on foot to build a road through the Great Bend country on the Columbia River, to connect the Northern Pacific and the Canadian Pacific lines. Also a line from Billings on the Northern Pacific northward to the Canadian Pacific, via Fort Benton; the portion from the fort northerly to be built with Canadian capital, with Sir A. T. Galt, of Montreal, at the head of the enterprise. He sailed for England on Saturday to secure aid for the project.

A large steamship has just been built in Sheboygan, Wis., nine-tenths of the timber of which came from Arkansas and Kentucky. Far-seeing men have long felt confident that the forests of the South would yet become one of the greatest sources of wealth to that section of the country, but few persons, probably, have ever expected to see a steamship built on Lake Michigan with Southern timber as early as 1888.

It does not yet appear that the Baltimore and Ohio Railroad is sure of getting into New York by way of the Reading and Jersey Central. In any event it is said that existing traffic arrangements in which the trunk lines are concerned will not be disturbed.

The total valuation of taxable real estate in Brooklyn this year, as shown by the assessment lists, is \$385,904,988, an increase of \$23,738,915 compared with 1887.

The Board of Army Engineers in New York is expecting soon to receive from Congress the plans for the proposed Hudson River Bridge for their examination and approval.

The Northern Pacific Railroad, according to the terms of agreement now published, has secured a foothold in Manitoba, and will construct branch lines in the province, maintaining the maximum rate for what and certain other classes of freight to Duluth, which rate, however, is considerably lower than that of the Canadian Pacific. The Government is to guarantee \$6000 per mile at 5 per cent. for 25 years. The Legislature will meet August 28 to sanction the agreement.

The opening of the Australian exhibition at Melbourne, 1st inst., was witnessed by 7000 persons.

The increase of traffic at Superior City taxes to the utmost the facilities at command for handling coal and merchandise, but costly improvements at that point in the shape of dock and warehouse accommodations will soon afford a measure of relief. Over 350,000 tons of coal and merchandise have been received this season at the docks of Superior up to the present date, and 2,148,233 bushels of wheat have been shipped from the elevators.

Consul General Cardwell, at Cairo, in Egypt, reflects the widespread desire of merchants there for the establishment of direct steam communication with the United States. American petroleum was for many years almost driven from the East by the Russian product, supplied at a lower price; but the superiority of the former assists it, and the ground lost is

steadily being regained. Of American canned goods a large supply comes Eastward from English shippers; hence they are accredited in trade as English goods. American vegetables, fruits and meats are sold everywhere in Egypt and the Levant, and so is American bacon and lard, all shipped from Liverpool and London, and set down in the trade reports as English products. Is it not reasonable to presume that Egypt could be supplied by direct shipments from home more cheaply than from other countries where production does not satisfy consumption. Much of the product, however, thus consumed in Egypt, as in the Levant, is drawn from America, paying in its transportation Eastward probably as much, if not more, profit to the English trader than it paid the American producer and manufacturer. The trade pays English, French, Italian and other merchants enormous profits, and it sustains huge steamship companies. With the vast, varied and valuable products of the United States it is senseless to presume a profitable trade could not be established and maintained. Our products, after introduction, would be greedily sought after, and a mutuality in commerce would spring up, which, because of the desirability of things interchangeable, would last.

The official reports of the British postal service show that the Government is rapidly perfecting its parcel post connections in all directions in which there is reason to hope for an extended retail foreign trade. There is apparent on every hand an increased appreciation of the parcels post as an important agency for the promotion of trade. The United States have made good progress in this direction, and other countries are competing energetically in the same line of enterprise.

W. C. Prime, the expert fisherman and exploring tourist, deprecates the fouling of the Ammonoosuck by sawdust. "The curse of the valley," he says, is the lumberman. In one instance a floating slab caught his line, and a "leader and two flies were lost." He indignantly says: "I dare not even hope that anything will be done in New Hampshire to arrest the degradation of the mountain streams, or stop the process of cutting away the forests. Russia, with her vast territories, is far ahead of America in intelligent legislation touching forestry. In my London papers I read of her new forest laws, which are directed to the preservation of rivers in the lowlands by keeping the uplands covered with the timber. Here it does not enter the heads of legislators that populations living in Hartford and Springfield and elsewhere in the lower country along the Connecticut have any interests in the mountain countries out of which the river comes. But they have; and Government, which ought to protect the commonwealth interests, should regard the important relations of sources to river-flows. It is of primary importance to preserve the purity of great streams flowing long distances."

The contractors for building the Texas State Capitol imported stone cutters from Scotland, because the stone cutters in this State refused to cut stone quarried by convict labor, which the State had agreed to furnish.

Attorney-General Tabor, to whom the New York Prison bill was referred by the Governor for an opinion as to its legal effect, has submitted his opinion, wherein it is held that the bill applies not only to the State prisons but to the State reformatories, all local penitentiaries, houses of refuge and the State Industrial School. The Attorney-General concedes that great difficulty will be experienced in enforcing the bill so far as local penal institutions

are concerned, owing to the omission from the bill of necessary provisions to carry its apparent intent into effect.

A number of capitalists have purchased the franchises lately held by the Central Missouri Railway Company, including a bridge across the Mississippi River at Alton, 20 miles north of St. Louis, and which, from its independent position will hold the key in the Southwest. The Alton bridge will cost not over \$2,000,000.

The fiscal representative of the Intercean Railway of Mexico, extending 700 miles from Vera Cruz to Acapulco, on the Pacific, says \$10,000,000 have been obtained in England, which will nearly complete the road.

California raisins, which were scarcely known in the market three years ago, will this year amount to 1,500,000 boxes.

Cleveland, Ohio, claims a population of 260,000. Detroit talks about 255,000, as indicated by the new city directory.

An oil refining company in Pittsburgh has made a new business departure by shipping refined oil to Europe. Recently 75,000 barrels have been sold, for Germany.

The number of acres which will be forfeited by land grant railroad companies in the event of the passage of the House bill by the Senate is over 51,000,000, including over 40,000,000 acres claimed by the Northern and Southern Pacific railroads.

A "flour trust" is proposed by the Western millers, who will meet in St. Louis 31st inst. to organize.

The time of transit of mails from the post office at New York to the post office at London and Paris respectively was reduced in 1887 from two to six hours by the fastest steamers, compared with the previous year. The gain arises quite as much from the greater care to avoid delays between the docks and the post offices as from increased speed of the vessels.

It is announced from San Francisco that owing to the withdrawal of steamers now running, trade between the Pacific Coast, Australia and New Zealand will be confined to sailing vessels, by way of Hong Kong. The Oceanic Company will still continue their line to Honolulu, but two of their steamers now in the Australian line will run from San Francisco to Vancouver, B. C., in connection with the Canadian Pacific Company.

The new steel ship Corona, constructed for the Oregon Improvement Company, was successfully launched by Nefie & Levy on Saturday. The new craft is 238 feet long, 36 feet beam and 23½ depth of hold, and is intended for service between San Francisco and San Diego. The machinery will be of the triple expansion type of 1200 horse-power.

The Bussey Bridge disaster, on the Providence Railroad, cost the company \$1,000,000. Good bridges cost less than the damage caused by rotten ones.

The new Harlem Bridge is fast nearing completion. The structure is up, but the flooring is not yet put in. The approaches are partly leveled and the bridge can be made ready for use in a few months.

The Baldwin Locomotive works have just completed for the New York, New Haven and Hartford Railroad six of the largest bituminous coal locomotives ever built by them. They weigh 56 tons each, and are expected to make the run from New York to New Haven with a full express train in 80 minutes. The firm have also just completed six heavy freight locomotives, four being for the Philadelphia and Reading Railroad, and two for the Central Railroad of New Jersey. They are of the consolidation type.

MANUFACTURING.

Iron and Steel.

J. Painter & Son, of Pittsburgh, signed the Amalgamated scale last week and their immense works are now running full time in all departments. The firm manufacture principally hoop iron and give employment to about 900 men.

The Tudor Iron Works, of St. Louis, Mo., signed the Amalgamated scale on Thursday, the 2d inst. Operations were resumed in all departments on Monday, the 6th inst.

The Jackson Furnace Company, of Jackson, Ohio, have increased their capital stock from \$25,000 to \$40,000, and it is expected they will be making iron in a short time. They will use five-sixths of raw coal and one-sixth New River coke, with small quantity of lake ore and cinder, and two-thirds of native iron ore. Mr. John Bird, from the Low Moor Furnace, in Virginia, and former manager of the Sarah Furnace, of Ironton, Ohio, for Campbell's Sons, will have charge of the furnace.

Isabella Furnace No. 1, of the Isabella Furnace Company, at Etna, Pa., which was blown out on April 5 last for relining and repairs, was blown in again on Wednesday, the 1st inst.

Edith Furnace, of the Edith Furnace Company, Limited, at Allegheny City, Pa., which is at present out of blast for repairs, will be blown in again about September 15th next.

The United States Iron and Tin Plate Company, whose works are located on the Baltimore and Ohio Railroad, about 5 miles from Pittsburgh, signed the Amalgamated scale last week. Their plant is now in full operation, giving employment to about 300 men.

The Beaver Falls Iron Company, at Beaver Falls, Pa., manufacturers of sheet iron and sheet steel, have signed the Amalgamated scale and resumed operations in all departments.

A notice has been posted in the Philadelphia Bridge Works of Cofrode & Saylor, at Pottstown, Pa., announcing a reduction of 10 per cent. in the wages of all employees, to take effect on the 16th inst. Extra time will not be allowed employees, except when they are specially requested to work, and then only at their regular rate. All salaried employees will be required to be on duty each working day of the year, and when absent and not on business for the firm deductions will be made, based on their rate per month. About 500 men are affected by the reduction.

Spang, Chalfant & Co., proprietors of the Etna Iron Works, at Etna, about 4 miles from Pittsburgh, have signed the Amalgamated scale and operations have been resumed in all departments. This firm should not be confounded with the Spang Steel and Iron Company, whose works are also located at Etna. The latter firm have not signed the scale, but are operating their works full time in all departments with non-union men, having just gained a complete victory over the Knights of Labor.

The Lebanon Mfg. Company, of Lebanon, Pa., who have been awarded the contract for 20,000 tons of castings for Claus Spreckles's sugar refinery, at Philadelphia, have advanced the wages of all their employees from 5 to 15 per cent.

J. P. Witherow, engineer and contractor, of Pittsburgh, is figuring on a contract for the erection of a large steel and iron plant, at Sabinos, Mexico. The plant is to cost \$3,000,000, and will consist of two blast

furnaces, a Bessemer rail and nail-plate mill and structural iron-works. The entire structure will be made of iron, which will be made in Pittsburgh and shipped there ready for building. The financial backers of the new scheme are English and American and Mexican capitalists.

Mary Furnace, of the Ohio Iron and Steel Company, at Lowellville, Ohio, which has been idle for some weeks, undergoing repairs, was blown in on Tuesday, the 31st ult.

On Wednesday, the 1st inst., General Superintendent Wm. R. Jones, of the Edgar Thomson Steel Works, at Braddock, Pa., had the satisfaction of seeing another of his inventions in successful operation. The contrivance is a metal-mixer, and its work is to mix the iron as it comes from the furnaces, thus securing iron of a uniform quality for use in the converter. By its use a more uniform grade of steel will be produced and very little scrap will be made.

The Aetna Iron and Steel Company, of Bridgeport, Ohio, signed the Amalgamated scale last week, and resumed operations in all departments. The firm manufacture sheet iron and sheet steel almost exclusively, and give employment to about 700 men.

The foundations for the hot-blast stoves, furnace stack and draft stack of the blast furnace at West Duluth, Minn., are about completed. The size of the furnace will be 75 x 16 feet. At West Superior, Wis., across the bay from West Duluth, a pipe foundry has been laid out and the erection of the walls has been put under contract. The initial capacity of this foundry will be 50 tons per day.

During the month of July the blast furnace of the Belmont Nail Company, at Wheeling, W. Va., produced 3525 tons of Bessemer iron.

The Pottstown Iron Company's steel mill, at Pottstown, Pa., has suspended operations for an indefinite period, owing, it is said, to the depression of trade. About 250 men are out of work.

The blast furnace of the Bellaire Nail Works, of Bellaire, Ohio, is still keeping up its remarkable work. For the month of July just closed it produced 4200 tons of Bessemer iron.

Pennsylvania Furnace, in Centre County, Pa., recently operated by the Centre Mining Company, Limited, which was blown out on May 23, will not again be started, as it is unprofitable to run it. The stack is 44 feet high by 10½ feet in diameter at the bosh, and was changed from charcoal to coke in 1881.

Benwood Furnace, at Martins Ferry, Ohio, owned and operated by the Benwood Iron Works, of Wheeling, W. Va., which has been undergoing repairs for some time, was put in blast on Thursday, the 2d inst.

Last week Riter & Conley, of Pittsburgh, shipped to Memphis, Tenn., a steel water tower of large proportions. It was 160 feet high and 26 feet in diameter, and will rest on a stone foundation laid 20 feet under the ground, and will be secured to it by 20-inch steel I-beams. The total cost of the tower was \$36,000.

Fayette Brown, who, under authority and orders of the U. S. Circuit Court, controls Brown, Bonnell & Co.'s iron works, at Youngstown, Ohio, started the plant in operation on Wednesday, the 1st inst.

The Helmbacher Forge and Rolling Mills Company, of St. Louis, are engaged on the forgings for two large cotton compresses, and in the railway axle department are running three hammers. The company say business is seasonable with

them, but complain that prices are very low. Their establishment is not affected by the wages dispute.

Graffton Furnaces, at Leetonia, Ohio, owned by the Graffton Iron Company, but operated under lease by Graff, Bennett & Co., of Pittsburgh, have been leased by W. D. McKeefrey, a well-known iron man of Sharon, Pa., in connection with W. D. Hofins, of Sharpsville, Pa., under the firm name of McKeefrey & Hofins. One furnace will be put in operation at once.

The Fred. J. Meyers Mfg. Company, Covington, Ky., have, among other large contracts, recently secured that for all the ironwork and railing for the new court house being erected at Topeka, Kan. A large number of local contracts have also been secured, and all departments, ironwork as well as hardware specialties, are being operated to their full extent.

The South Pittsburg Pipe Works, South Pittsburg, Tenn., have completed a second pit, and are intending to build a third. They are now making 35 tons of pipe per day.

Alex. Laughlin & Co., engineers and contractors, of Cleveland Ohio, have closed a contract with Kelly Nail and Iron Company, Ironton, Ohio, for two regenerative gas heating furnaces, with working hearths 7 x 16 feet, and four three-hopper batteries of their improved steam blast gas producers. This plant will be an exact duplicate of the one now being erected by the same firm for the Belfont Iron Works, and will be used for heating muck iron and steel slabs for the nail-plate train.

The Findlay Rolling Mill Company, of Findlay, Ohio, who also own and operate the works of the Briggs Iron and Tool Company, at the same place, have just purchased the works of the Sterling Chain Company, at Cuyahoga Falls, Ohio, and will remove them to Findlay at once and get them into shape to make chains by August 15 next. The works will have a capacity of 10 tons per day and will employ between 80 and 90 men.

A syndicate has been formed to build two furnaces, and money is deposited, location selected on lands donated by Bessemer Land and Improvement Company, at Bessemer, plans adopted and work begun on tramways, foundation, &c., by the Bessemer Iron and Steel Company, H. F. De Bardeleben, president, and Charleston, Savannah and Alabama capitalists. The capital is \$1,500,000, and furnaces are to be 17 x 75 feet, exact duplicate of De Bardeleben Coal and Iron Company's furnace now in operation. This syndicate bought large bodies of ore lands in Murfree's Valley, coal lands in Cahaba Valley, including the Henry Ellen coal mines.

The large coke furnace of the Gadsden-Alabama Furnace Company, at Gadsden, Ala., is expected to be ready to go in blast about September 1.

The Belleville Nail Company, of Belleville, Ill., have increased their capital stock from \$100,000 to \$300,000, and changed their name to the Waugh Steel Works.

Bear Springs charcoal furnace, near Dover, Tenn., was blown in on the 24th ult.

The Little Belle Iron Company has been organized, and will build a charcoal furnace 12 x 60 feet, with an estimated capacity of 60 tons, at Bessemer, Ala. The capital is \$200,000. The president is H. F. De Bardeleben, of Alabama; vice-president, M. E. Lopez, of South Carolina; board of directors, E. A. Burke, Bessemer, Ala., and J. N. Carpenter and R. F. Learned, of Natchez, Miss. The Bessemer Land and Improvement Company donated

ten blocks of ground for location. Surveyors are at work, plans adopted and the furnace to be finished within 14 months.

A dispatch from Bellefonte, Pa., under date of the 2d inst., reads as follows: "The injunction served on the Howard Rolling Mill and Furnace Company at the instance of Gen. Simon Cameron last week has been set aside by the court. The machinery, therefore, will be shipped to Lockport, Ill., as soon as available."

M. V. Smith, metallurgical engineer, of Pittsburgh, has just closed a contract for the erection of a regenerating gas furnace for J. H. Sternbergh, formerly of Reading, Pa., who is now erecting a bolt works at Kansas City, Mo. The ironwork for this furnace will be furnished by Sterrit & Thomas, proprietors of the Vulcan Foundry, at Pittsburgh, while Welsh, Palmer & Maxwell, also of that city, will furnish the fire-brick for the same.

Owing to the depression in the iron trade, the Logan Iron and Steel Company, of Lewistown, Pa., have suspended a number of workmen for an indefinite period. Since the latter part of June the firm have been operating their puddling department single turn.

At a recent meeting of the stockholders of the Scottdale Iron and Steel Company, Limited, of Scottdale, Pa., the following board of managers was elected, to serve for one year: J. R. Stauffer, P. S. Loucks, Thos. Termant, Clark Grazier, W. N. Taylor, J. W. Ruth and W. N. Porter. At a subsequent meeting of the managers P. S. Loucks was elected president, J. R. Stauffer treasurer and Clark Grazier secretary. The company are in first-class financial condition, and prospects are bright for continued operation of the works.

The Trumbull Iron Company, of Girard, Ohio, are putting a new 3-high muck train into their rolling mill, and making other preparations for a good run when the works start up again. This will probably occur on the 6th of August, the wages question having been settled. The company expect to increase their output very considerably during the coming year, the prospects in their line now being most excellent. They make a specialty of small irons and special shapes for the agricultural implement trade. George F. Russell, whose headquarters are at the Grand Pacific Hotel, represents this company in Chicago.

The Kansas City (Mo.) *Commercial* is authority for the statement that a large rolling mill will be located in Armourdale in the future, but the names of the capitalists backing it have thus far been withheld from the public. The plant will employ about 250 men, and a large amount of capital will be invested in it. It will be located at the foot of Thirteenth street and Pony avenue, on the line of the Belt Line road. The ground secured for the plant extends back to the Kaw River. It is rumored that the new company have purchased much of the machinery of the old Rosedale rolling mills. The machinery is very valuable, and has been carefully guarded for five or six years, or ever since the Rosedale rolling mills went into bankruptcy.

Machinery.

The Hill Clutch Works, of Cleveland, Ohio, manufacturers of friction clutches and power transmission machinery, are running full force in all departments night and day. Among recent contracts for complete plants of machinery they report the following: Oakland, Cal.; Canton, Ohio; Des Moines, Iowa; Lawrence, Kan.; Ionia, Mich.; Crawfordsville, Ind.; St. Paul, Minn.; Pittsburgh, Pa.

The Bignall & Keeler Mfg. Company, of St. Louis, Mo., have plenty of work, and have begun to run over-time. They are working on a cotton-gin-saw ginning machine, a new invention which they are manufacturing for J. G. Falls & Co., of Memphis, Tenn. They have also completed a large pipe machine for some mining works, at Ishpeming, Mich.

Nicholson & Waterman, of Providence, R. I., have recently furnished the Rhode Island Locomotive Works, of Providence, a complete outfit of their special machinery for finishing bolts and nuts, and are now building for Armington & Sims Engine Company, also of Providence, two boring mills and three 32-inch lathes. They recently furnished a 32-inch and a 16-inch lathe to James Rees, of Pittsburgh, Pa.

Chas. A. Schieren & Co. report recent sales of their leather link belting to the following: Morrison Bros., Mt. Olivet, Ky.; Waterbury Buckle Company, Waterbury, Conn.; L. M. Rumsey Mfg. Company, St. Louis, Mo.; Goodyear Rubber Company, Milwaukee, Wis.; Arkansas Oil and Compress Company, Texarkana, Ark.; Jas. S. Senior, Little Falls, N. Y.; Geo. F. Patterson & Co., Baltimore, Md.; M. Hagarty & Co., West Bay City, Mich.; W. A. Strayer, Canton, Ohio; Bonnett Bros., Louisville, Ohio.

The Dean Bros. Steam Pump Works, Indianapolis, Ind., are operating their works to their full capacity. Among their more recent and large contracts are a complete outfit to supply water to the city of Marion, Ind., having a capacity for pumping 3,000,000 gallons per day. A large Duplex pump, with a capacity for pumping 500,000 gallons per day, was shipped to the Ashland Iron Works, Ashland, Wis.; also one Duplex, with a capacity for 1,000,000 gallons, to the Franklin Iron Works. In addition a large number of orders for smaller sizes have been filled and still remain on their books.

Hardware.

The works of the Braddock Wire Company, at Rankin Station, Pa., manufacturers of wire rods, plain and barbed wire, have been closed down for the past few weeks for the purpose of making extensive repairs in the rod mill. Operations will be resumed in full in the course of a few days. The company have recently very largely increased their capacity for the manufacture of barbed fence wire, and in the future will manufacture the genuine Glidden two-pointed barb wire. They report business very good, with plenty of orders on hand.

A company are being organized at Fort Worth, Tex., by W. F. Lake and others, for the purpose of manufacturing barbed wire. They will have a capital of \$50,000.

The new works of the Bryden Horse Shoe Company, at Catasauqua, Pa., are being rapidly pushed to completion. The works are eligibly located near the rolling mill of the Catasauqua Mfg. Company, and with switches running into their yards, connecting them with the Lehigh Valley, the Jersey Central and the Catasauqua and Fogelsville railroads. The new buildings, which are large, light and airy, will be filled with the most improved machinery for making horseshoes under the many patents owned by the company. The new works will be started up before the old works are abandoned, so that there will be no stoppage in the filling of orders. While the new plant will have a capacity to turn out at least four times the present output, the company still have ground sufficient to quadruple the capacity of their new works, and if the business increases in the future as it has in the past they will need it before many years.

Miscellaneous.

Among recently authorized corporations in Illinois are the following: The Glover & Chandler Steam Logger Company, of Chicago; capital, \$500,000; incorporators, Thomas J. Rodman, William H. Cook and John Marr. The Chicago Horseshoe Company, of Chicago; capital, \$1,000,000; incorporators, James W. Fernald, Edward L. Lamb and Robert L. Atkins. The R. J. Douglas Company, of Waukegan; capital, \$100,000; for the manufacture of boats of all kinds; incorporators, Robert J. Douglas, Miles G. Nixon and Ashley B. Palmer. The Standard Metallic Packing Company, of Chicago; capital, \$150,000; incorporators, William L. Calkins, Charles B. Coventry and Albert D. Lewis.

The capital of the Clinton Woodenware and Match Factory, at Clinton, Iowa, has been increased from \$20,000 to \$50,000, subscribed by Chicago, Philadelphia, Buffalo, St. Paul and Minneapolis parties. A stone factory will be erected, and the Fyson fusee match, now imported, will be manufactured. One hundred hands will be given employment the year round.

The American Enamel Company, Limited, of Beaver Falls, Pa., whose business is the manufacture of enameled advertising signs, street names, &c., are negotiating for the lease of another building at New Brighton, Pa., about two miles from their present location, with a view of increasing their business, which has already assumed large proportions.

Oil for Fuel.

Dr. C. B. Dudley, chemist of the Pennsylvania Railroad, in a lecture delivered before the Franklin Institute early this year, formulates the following conclusions on the use of oil for fuel:

The difficulty in regard to burning oil successfully has been overcome. Two other powerful difficulties still remain—increased cost for the same amount of heat and limited supply, and it is for the future to determine whether either of these difficulties can be overcome. As to the possibilities of the future it is difficult to say a great deal, but there certainly is very little hope for fuel oil as long as efforts are made to diminish production. It is possible, however, we think, that with present reduction, a limited amount of, say, 10,000 or 15,000 barrels per day of oil might be used to advantage as fuel, but it would probably require changes in the method of distillation with the idea in mind of making a fuel oil and possible changes in the methods of utilizing the heat generated, as has already been described, to get economy even in this limited way. There is also the rather paradoxical statement that those points furthest away from the oil fields can probably use oil to advantage, when it could not be used to advantage in the oil field itself. This is due to the fact that the same heat-producing power weighs less with oil than with coal, and consequently the freight, which is an important element always in the cost of fuel, would be in favor of the oil. In our judgment the future of fuel oil in this country, and until some other very much greater sources of supply are discovered, is in the hands of the refiners. By shaping the distillation in such a way as to produce a fuel oil at low figures, it can be burned, otherwise not.

Four hundred miles at a speed of nearly 1 mile a minute is the record which has been made and which it is proposed to maintain on rival English roads competing for passenger traffic for their Edinburgh expresses.

The Iron Age

New York, Thursday, August 9, 1888.

DAVID WILLIAMS, - - - PUBLISHER AND PROPRIETOR.
CHAS. KIRCHHOFF, JR., - EDITOR.
GEO. W. COPE, - - - ASSOCIATE EDITOR, CHICAGO.
RICHARD R. WILLIAMS, - - HARDWARE EDITOR.
JOHN S. KING, - - - BUSINESS MANAGER.

The Cheapest Pig Iron in the World.

During the past few years we have repeatedly heard enthusiastic promoters boldly claim for their favorite locality low costs of production, rounded off with the final statement, "We can beat the world." Of course every one familiar with selling prices abroad would hardly think it worth while to correct such assertions, yet we question whether many ironmasters even are aware how low pig iron is being produced in some localities abroad. We believe that the distinction of having the lowest record of cost belongs to the Ilse Works at Grossilsede, Germany. The figures have been lately published by Fritz W. Luermann, a very well-known engineer, in *Stahl und Eisen*, the data submitted being interesting also from a technical point of view, since they trace the effect of improvements in practice over a protracted period, both on increased product and lowered fuel consumption.

The works have three furnaces equipped with Gijers stoves, one stack always being in reserve, two blowing engines with 540 c. m. piston displacement per minute together, and three with an aggregate displacement of 1460 c. m. The heating surface of the boilers is 2053 sq. m. The ores are argillaceous and calcareous, from mines in proximity to the furnace plant, some of them being washed. Coke is produced now in 156 ovens at the furnace, the purchase of outside coke having steadily diminished since 1872, while the steam required has been raised almost entirely of late by the waste heat from the ovens, the quantity of steam being steadily decreased by improvements in machinery. The following table will illustrate this feature:

Coke Consumption per 10 Tons of Ore Charged.

Year.	Yield of ore.	Coke consumption. Kg.	Ash. Per cent.	Temperature of blast. Degrees Celsius.
1867.....	33.68	4,641
1868.....	35.16	4,369	222
1869.....	35.15	4,271	10.00	225
1870.....	35.60	4,357	11.58	257
1871.....	35.50	4,325	13.58	296
1872.....	36.27	4,324	14.10	301
1873.....	36.96	4,561	14.17	285
1874.....	37.05	4,175	13.10	271
1875.....	37.12	4,257	12.40	307
1876.....	36.88	4,067	11.81	345
1877.....	36.75	3,967	10.30	340
1878.....	36.21	3,646	10.60	420
1879.....	36.46	3,470	10.20	402
1880.....	36.14	3,462	8.90	402
1881.....	35.68	3,441	9.50	442
1882.....	35.47	3,401	9.50	480
1883.....	35.12	3,488	9.30	452
1884.....	35.44	3,474	8.90	456
1885.....	35.77	3,234	8.78	455
1886.....	35.55	3,200	9.08	428
1887.....	35.57	3,025	8.67	453

It will be noted that while the yield of ore has remained fairly uniform, the coke consumption has declined steadily, being only 3025 kg. per 10 tons of ore smelted in 1887, against considerably over 4000 kg. during the period of 1867 to 1877.

This has been aided by a lowering in the ash of the fuel, and by higher temperatures of blast, although the latter is only now less than 850° F.

The consumption of fuel for raising steam has also shown a marked decline. In the following table the quantity of coal used for raising steam is given, with the ash contents of the same, and also the equivalent, in kilograms of coal, of the waste heat of the coking ovens required for firing, all on the basis of 10 tons of ore smelted:

Fuel used for Raising Steam for 10 Tons of Ore Smelted.

Year.	Coal used. Kg.	Ashes. Per cent.	Equivalent in coal of coke gas used. Kg.	Total fuel. Kg.
1867.....	1422	1422
1868.....	1188	1188
1869.....	1175	11.10	1175
1870.....	1453	13.03	1453
1871.....	1317	13.77	116	1433
1872.....	1102	14.20	350	1452
1873.....	1251	13.80	398	1559
1874.....	714	11.50	445	1159
1875.....	257	9.05	565	822
1876.....	48	9.07	656	704
1877.....	8.14	638	638
1878.....	5	8.30	632	637
1879.....	8.50	626	626
1880.....	7.80	610	610
1881.....	14	7.70	752	766
1882.....	144	8.30	565	709
1883.....	184	8.60	503	687
1884.....	154	8.20	560	714
1885.....	11	7.80	665	706
1886.....	48	7.20	691	679
1887.....	0.5	7.42	747	747.5

These figures clearly show the effect of the substitution of waste cokeoven gas for direct coal firing, while the last column indicates the saving in fuel by improved boilers and machinery.

Turning now to the economical results, we have the following figures, which give the daily average product from year to year, in metric tons, the cost of ore, the wages, the cost of materials outside of fuel and ore, with repairs added—all on the basis of 10 tons of ore smelted, and finally the total cost per metric ton of pig iron in marks:

Costs of Ilse Pig Iron.

Year.	Daily product. Metric tons.	Cost of 10 tons of ore.				Total cost of pig iron. Marks per metric ton.
		Cost of ore.	Wages.	Matls and repairs.		
1867.....	32.7	11.05	13.85	5.20		41.96
1868.....	52.7	10.62	11.72	4.17		35.77
1869.....	61.5	12.00	12.21	4.02		35.46
1870.....	71.6	14.28	12.60	4.02		36.96
1871.....	68.4	15.72	13.59	4.71		43.90
1872.....	72.4	18.97	14.40	5.10		47.51
1873.....	74.0	20.22	16.80	6.58		64.62
1874.....	76.4	19.95	16.47	5.22		47.94
1875.....	79.4	25.42	14.68	4.01		39.04
1876.....	76.1	25.62	13.12	3.51		38.40
1877.....	84.6	25.80	11.73	3.22		29.67
1878.....	95.0	28.05	10.79	2.98		27.83

1886.....	142.1	22.44	9.71	2.89		22.81
1887.....	156.2	24.18	8.79	2.42		23.01

It is a matter for regret that the cost per unit of fuel is not given. Still, as they stand the figures are highly instructive. While the cost of ore has more than doubled since 1867, the output per day has been tripled, labor per ton has declined heavily and the cost of repairs and of materials other than ore and fuel has fallen to one half. The general result is that the cost of pig has fallen from 41.96 marks per metric ton in 1869 to 23.01 marks in 1887, or, taking the mark at 24 cents, \$10.23 per gross ton in 1867 to \$5.62. It may well be questioned whether there

is any other plant in the world which produces pig iron so cheaply. It is not surprising that under the circumstances the works declared a dividend of 20 per cent., especially since the product is particularly suitable for basic steel manufacture, the iron carrying 3.22 per cent. of carbon, 2.92 per cent. of phosphorus, 2.38 per cent. of manganese, 0.049 per cent. of sulphur, and 0.108 per cent. of silicon, while the cinder analyzed 30.24 per cent. of silica, 0.82 per cent. of protoxide of iron, 11.90 per cent. of alumina, 9.81 per cent. of protoxide of manganese, 40.5 per cent. of lime and 1.9 per cent. of magnesia.

Mr. Luermann in reviewing these figures draws a comparison between the work at South Chicago and that at Ilse in favor of the latter. At Ilse the two furnaces produced in 1887 113,997 metric tons of pig iron from 320,489 tons of ore and cinder and 11 tons of scrap. Deducting the latter, the yield was 35.57 per cent., the fuel consumption being 96,961 tons of coke, showing a charge of 330 pounds to 100 pounds of coke, in spite of low blast temperatures. He cites in comparison with this South Chicago, where the yield of No. 7 was 54.3 per cent. of iron, but smelted daily only 368 tons of ore with 173.4 tons of coke, while Ilse No. 2 worked daily 443 tons of ore, consuming only 134 tons of coke. The record of Ilse stands 330 pounds of charge to 100 pounds of coke, as against 180 pounds of charge at South Chicago. We believe, however, that in the case of the former the ores were self-fluxing, while at South Chicago a considerable quantity of limestone must be added.

Settling a Labor Dispute.

Considerable food for thought can be found in the following leaf from the experience of an iron manufacturer whose success in handling men has been most remarkable. The account was taken from his own lips, but the facts have been slightly disguised so that his identity may not be too readily discovered.

In starting a new mill on a specialty he made a contract with his workmen to pay them a fixed scale of wages for a year, which they agreed to abide by, a duly appointed committee signing for them. After working very harmoniously for a few months it was discovered that a mill in another part of the country running on the same specialty were paying 20 per cent. more for the same class of work. Notwithstanding the contract which they had signed, and which still had several months to run, the workmen in the mill first referred to demanded that their wages be advanced to the same rate as in the other mill, and threatened to strike. The leader of their trades union was summoned to assist them in the expected contest. When he made his appearance on the ground he sought an interview with the manager of the company, who received him politely, showed him the contract which the men had signed, and obtained from him the assurance that such a contract would be respected, or if the men persisted in striking they would have to fight the battle alone. A committee of the workmen were called into the office, the union leader made a short statement

to them in which he clearly demonstrated that they were bound in honor to maintain their own agreement, and they yielded with but slight dissent. In the meantime the manager had carefully investigated the question of the difference in wages, and believed that the desired advance could be made without loss to the company if he could secure the co-operation of the workmen in running the mill more economically. After they had so gracefully yielded their point in the controversy the opportunity presented itself for treating the question on broad ground of fair dealing between man and man without the element of coercion entering into it. He therefore told the committee to wait a few moments, and then informed them that he had decided to give them the advance they had demanded and to waive the contract, but upon this one condition—namely, that they would agree each and all to work for the best interests of the company, saving fuel wherever it could be saved, economizing in other materials wherever possible, taking greater care not to burn metal in the furnaces, &c. It may be imagined that there was a hearty assent from the men when this "plan of campaign" was unfolded to them. They retired to their several posts apparently determined to carry out their part of the new agreement, and their good faith was shown at the end of the next month when the books of the company demonstrated that a saving in the cost of production had been effected which slightly exceeded the advance made in wages.

Now, there may be very few strikes in which the issue is so clear cut and the rights of either party are so well defined as in the case just cited, but there are undoubtedly many strikes and disagreements in which an equally satisfactory settlement to both sides could be secured if the matter were treated properly, and handled judiciously from the beginning. If in this instance the workmen had disregarded the decision and the advice of the union leader, and had determined to strike and take the consequences, the manager would, in all probability, have felt impelled to stand up for the rights of the company in the premises, and months of idleness and great pecuniary loss to both parties would have intervened. On the other hand, his unexpected action in conceding the point which his workmen could not have obtained by coercive measures prompted them to earnestly strive, so far as they could, to repay him for his expressed sympathy for and confidence in them.

The Wheat Markets.

Since the beginning of last month the weather has been so abnormally wet and cold in Europe that the yield of wheat in particular has been very much crippled. It is estimated the requirements of the European importing countries during the coming season will be 320,000,000 bushels, against a surplus of 256,000,000 in the exporting countries. As the American markets are and will be drawn upon largely, an advance has taken place in this market in December wheat, from 92½ cents on July 1 to 97½ cents on July 28. Since then there has been a temporary reaction to 94½ cents, from which it has since partly recovered.

The French wheat crop is estimated to be 35,000,000 hl. short—100 hl. equaling about 272 bushels. It is reported from there that the hay crop has been destroyed, and that peasants have been compelled to kill their animals, being unable to feed them. Corn cannot ripen, potatoes are rotting and the vintage will be inferior. The average wheat crop of Italy for the past ten years has been 132,000,000 bushels, which puts it third in rank as a wheat-producing country in Europe. The present crop is estimated at 120,000,000 bushels, while her requirements will be 140,000,000. Russia and India will probably furnish the 20,000,000 bushels that will be wanted to cover the deficiency.

The weather this month will be decisive as to the yield in the United Kingdom. While 80,000,000 bushels constitute an average yield, it has fallen as low as 60,000,000. Should it prove no greater than the latter figure this year 150,000,000 bushels will have to be imported. As far as the reports go Austria-Hungary will not reach an average wheat crop. Last year that country had an abundant yield, with a surplus for export of 20,000,000 bushels, of which 13,000,000 have been shipped. Russia is likely to have a surplus for export—how large is as yet doubtful, but the general report states that the outlook is fairly good. The incessant rains were, however, damaging the quality in a good many localities, especially in Podolia and Bessarabia. As for Germany, the floods were more extensive in Silesia than they have been for 30 years past. The same complaints reach us from Switzerland. The Netherlands and Denmark promise an average wheat yield, yet they together have imported about 26,000,000 bushels during the past ten years as an annual average. In Spain the weather has been unusually cold. Such being the outlook in Europe, all eyes are turned to the United States to India, the Argentine Republic, Chili and Australia.

In this country the wheat crop may possibly reach 440,000,000 bushels. Last year we shipped 95,128,641 bushels of wheat, against 89,204,887 in 1886, and 12,181,310 barrels flour, against 9,851,536. British India will probably harvest this year 254,000,000 bushels, which would be 20,000,000 in excess of 1887, when the surplus for export was 27,000,000 bushels. The maximum shipped thence has been about 40,000,000 bushels. Australia has 10,000,000 bushels to spare this year. Up to June the shipments to Europe in hectoliters were:

	1887-88.	1886-87.
From South Australia..	6,654,375	3,815,000
From Victoria	4,668,564	4,235,012
From New Zealand....	1,925,000	2,204,173
From New South Wales	1,613,126	2,054,095
Total.....	14,861,065	12,308,280

The Argentine Republic and Chili, taken together, may ship to Europe 6,000,000 to 10,000,000 bushels.

The weather this month in Europe, and the influence it will have on the crops in England, Russia and Germany, will probably even more decisively shape the course of values in the wheat markets on both sides of the Atlantic either way than it did in July. Meanwhile freights from the wheat exporting countries have also been looking up, and will have to be taken into account. But even if they rise still fur-

ther they will not materially check the outflow of wheat to where it is wanted, and the United States will at any rate be large exporters at prices largely remunerative to our farming population.

The July rise in Wall street has been largely in anticipation of the stimulating effect which the prospect of good prices for what wheat we export is to have upon the railroads. Discounting the future three or four months the professional speculators have given the first sign of the revival in all lines of trade which fair crops at moderately remunerative prices would have. Practically two-thirds of the whole of our winter wheat crop is secured. Spring wheat is still in a critical stage of development, and may yet be seriously damaged. Should the corn crop come up to expectations, which will depend upon the developments of the next few weeks, then we may look forward to a quickening in trade of which those engaged in hardware, iron, steel and the metals will receive a due share. As it is the situation is encouraging, but it is not yet quite beyond the range of possibly serious setbacks.

Assisted Emigration.

Word comes from Europe that the United States are about to receive a heavy accession of Italian laborers, and from the accounts given these newcomers will be made up very largely from the building trades, in this respect possibly of a quality superior to most of the Italian emigrants who have preceded them. The announcement not unreasonably excites concern on the part of those classes of artisans who are liable to feel the pressure in an overcrowded labor market. And elsewhere the question is asked whether this country has not reached the limit of safety in its assumed ability to absorb and assimilate foreign ingredients. The elements thus introduced into our social system are to a certain extent cumulative, corresponding in their effects to the workings of poisonous substances, such as lead or mercury, in the system, which, though taken in very minute quantities, finally produce violent disorder. We have an example and a warning in the anarchist outbreak at Chicago. Clearly enough America is interested to know the character of the threatened invasion of King Humbert's subjects, especially as is rumored on pretty direct authority that the Imperial Government is "promoting and financially assisting an exodus of its pauper hordes." The facts appear to be that the Italian Government, in its anxiety to architecturally renovate the ancient city of Rome, and at the same time give employment to labor, has gone to an extreme which is now naturally followed by violent collapse. The new buildings erected so far exceed in this capacity the needs of the inhabitants that those now unoccupied are sufficient to accommodate a population equal at least to one-half of the total inhabitants, who number only about 300,000 all told. The consequences are seen in ruined speculators, discharged laborers and financial disaster. The banks and Credit Foncier establishments, in their alarm, refuse to discount the paper of the contractors. The workmen, thus suddenly cut off from their resources, do not hesi-

tate to plunder the bakeries, causing frequent conflicts between the mob and police. It is in this emergency that resort is had to emigration, and the United States are expected to receive the refugees with open arms. The facts as yet are scarcely known beyond the nation boundary, owing to the strictness of the press censorship, no telegraph dispatch, it is said, having been permitted to leave the country.

New York City, to which most of the Italian emigrants are consigned, is not prepared to receive further additions. Already the local authorities are overtaxed. The Italian consul saw the wisdom of sending back within the last week 300 persons who must have become wholly dependent on charity, if indeed they were not already destitute. The whole subject is a fitting one for Congressional inquiry, and it is well that much information pertinent to the case has already been gathered, which may assist in intelligent action. It has been clearly shown in the course of this inquiry that, in defiance of our laws, contract labor is being brought to this country on a very extensive scale, a large number of men practically mortgaging future earnings to pay for advances of passage money. There can be no doubt that this system must be energetically suppressed.

In the face of low prices, and in spite of all predictions of a sorrowful ending, the Southern ironmasters go on increasing their plant. Hardly have the two furnaces at Bessemer begun work than two new coke stacks are to be begun at the same place under the leadership of H. F. de Bardeleben, to which is to be added a charcoal furnace by the Little Bell Iron Company at the same place. Cartersville, Ga., is to have two new plants, one for the manufacture of ferromanganese.

Tonnage of the Mahoning Valley, Ohio.—J. H. Sheadle, Secretary of the Mahoning Valley Iron Manufacturers' Association, has completed his tonnage report of the mills and furnaces of the Mahoning Valley for the year ending July 1, 1888. During a portion of the time many furnaces were closed down by reason of the coke strike. For the year the tonnage items were as follows:

	Tons.
Rolling-mill shipments.....	196,421
Rolling-mill receipts.....	411,848
Blast furnace shipments.....	306,757
Blast furnace receipts.....	1,182,629

During the same period the railroads represented in the Mahoning Valley were paid \$1,685,496.46 for freights. A conservative estimate of the revenue derived from the transportation of the product of these industries to the markets shows that it approximated \$1,000,000 additional. The railroads on incoming freight moved 169,451,457 tons 1 mile, and on outgoing freight hauled 158,486,179 tons 1 mile, a total of 327,937,636 tons. The tonnage of these rolling mills and furnaces for a year is equal to 62 per cent. of the railroad traffic of Texas, 95 per cent. of Georgia, 8,000,000 tons greater than that of Iowa, one and one-third times the tonnage of Vermont, and the same of Connecticut, twice the tonnage of Maine, and equal to the total tonnage of Arkansas, Oregon, West Virginia, New Hampshire and Delaware.

The fifty-second meeting of the American Institute of Mining Engineers will be held at Buffalo, N. Y., beginning on Tuesday evening, October 2, 1888.

THE AMALGAMATED ASSOCIATION.

A SKETCH OF ITS HISTORY.

As one of the best organized and most successful labor unions in this country, the Amalgamated Association of Iron and Steel Workers possesses particular interest, especially for those connected directly or indirectly with the iron and steel trades. The annual report of the Chief of the Bureau of Statistics, Hon. Albert S. Bolles, of Pennsylvania, for the year 1887 contains a history of the development of that organization by Mr. Charles G. Foster, editor of the *National Labor Tribune*, which is the official organ of the association. The report is too lengthy to be given space in full, and is naturally in some respects an *ex-parte* statement so far as its comments are concerned. We abstract from it, however, the leading historical facts and some data relating to the details of the organization past and present.

The Amalgamated Association grew out of the combination of several unions in different departments of the iron and steel trades west of the Allegheny Mountains, the most important of them being the United Sons of Vulcan, organized on the 12th of April, 1858, in a back room of a then popular hostelry in Diamond Alley, Pittsburgh, known as "Our House." The utmost secrecy was maintained, and after six months of a troubled career the effort was abandoned. It was not until 1861 that the organization was revived, Miles S. Humphries being chosen Grand Master in that year. Conditions for its growth were favorable, and in January, 1865, Mr. Humphries submitted to a conference a scale system of prices, developed from a suggestion made by Mr. B. F. Jones, of Jones & Laughlins' American Iron Works, Pittsburgh. After a joint meeting of the trade a scale of prices was adopted on the 13th of February.

Another of the iron and steel unions was the Associated Brotherhood of Iron and Steel Rail Heaters, organized in August, 1872, the first lodge being formed in 1869 at Chicago. In the first convention, in 1872, the word "rail" was dropped, and bar, plate and guide mill heaters were made eligible to membership. The brotherhood started with nine lodges, and at the second convention, held in Allegheny City, Pa., in May, 1873, it had 22 lodges. Mr. Foster adds that thereafter internal dissensions absorbed the energy that should have been devoted otherwise, and the brotherhood did not make a record for usefulness.

Yet another of the separate unions was the Iron and Steel Roll Hands' Union, organized in 1870, of rollers, roughers, catchers and hookers employed at the North Chicago mills. At a national convention held in 1873 the union had grown so that delegates were present representing 15 lodges, with a membership of 478.

The United Nailers were composed of a few local lodges without national organization. The first official action toward amalgamation was that by the Iron and Steel Roll Hands' Union at their convention in Columbus, Ohio, in April, 1874. The National Forge of the United Sons of Vulcan, held in Philadelphia in August, 1875, took favorable action, the joint Committee on Amalgamation of the Associated Brotherhood of Iron and Steel Heaters, Rollers and Roughers and the Iron and Steel Roll Hands' Union, at Indianapolis, Ind., August 7, 1875, deferred further immediate consideration of a resolution looking to the amalgamation of these two bodies, with the view to including also the United Sons of Vulcan. The action of the latter at Philadelphia was the outcome of correspondence with it, author-

ized by the Roll Hands' Union, but there was some delay because of the neglect of the National Forge to appoint a committee of conference.

At the next annual meeting the president, Mr. Harris, urged very strenuously the necessity and the advantages of the consolidation of all branches of iron and steel workers. The other organizations in interest met in the same city, Philadelphia, coincidentally. The result, however, was not as definite as it might have been, but, in correspondence subsequently held by the new president of the United Sons of Vulcan, Capt. Joseph Bishop, an arrangement was made for a meeting of committees of the several organizations at Pittsburgh, on December 7, 1875.

The result of this meeting was the formation of a constitution and by-laws for an Amalgamated Association, to be submitted to the lodges and forges, and to be then organized at a joint convention at Pittsburgh on the third of August, 1876. After a few alterations the constitution and by-laws submitted by the joint committee were accepted, the principal point being to strike out from the constitution the word "arbitration," leaving conciliation alone as the main principle to guide the policy of the organization.

Mr. Foster summarizes as follows the salient features of the first constitution thus adopted:

The Amalgamated Association claimed jurisdiction over all lodges then or thereafter to be organized as to matters of general importance relating to the welfare of the organization, its decisions thereon to be final, and to it belonged the authority to determine the customs and usages of the trades in interest. The officers were a president, secretary, a vice-president for each district, a treasurer and three trustees. Subordinate lodges could be organized upon a nucleus for each of not less than five practical iron and steel workers, each to have a corresponding representative whose duty consisted in giving a full report of his sub-lodge to headquarters on the last day of every month. Revenue was derived from the issue of sub-lodge charters, rituals, traveling cards, &c., and a quarterly tax in the discretion of the president, and a fund of 25 cents *per capita* each quarter was required to be provided as a protection against "a rainy day" of strikes and lock-outs. The convention was to be annually on the first Tuesday of August. A member in good standing desirous of migrating was entitled to a traveling or clearance card, to be issued by headquarters on request of his sub-lodge, which card was necessary to his amicable reception by other sub-lodges. A "dishonorable member" was defined as one guilty of having robbed or embezzled from a brother member, or having left in debt to a member with intent to defraud, or had fraudulently received or misapplied funds of the association, or had slandered any brother member, or had advocated division of the funds, or separation of lodge districts, or acted contrary to the established rules of the association on any question affecting the price of labor or the system of working in any district, provided this was opposed to the interests of his fellow workmen in keeping with the rules of the association. Such dishonorable member was disciplined by fine, suspension or expulsion, as determined by a vote of two-thirds of the members of his sub-lodge present at his trial.

The vice-president of a district was empowered to legalize strikes, and his duty further compelled him to furnish headquarters with complete statements of such difficulties and other grievances; but a vice-president was not authorized to legalize a strike until after thorough investigation, and all honorable means of avoidance

had been employed. An illegal strike was entitled to no aid from the common fund, nor was a member except his record was clear. The point of protection of members deemed of most importance was discharge from employment for taking active part in the affairs of the association. But a member thus discharged had to show that there was no charge of misconduct or willful neglect of his work for his own pleasure, or for attending meetings or for attending other business of the association without leave of absence from the manager over his department. In such case the association paid the discharged member a weekly allowance until a situation was procured for him.

In the course of time the methods of the association were modified and developed further, the following provisions of the latest amended constitution giving an idea of its present methods:

The president has authority to visit any sub-lodge and inspect its proceedings, and if a sub-lodge refuse to place any book or other information in its possession in his hands whenever required, he may fine or suspend the offending sub-lodge and report such action to the secretary of the national lodge, who, in turn, reports the same to the vice-president of the district and to all other sub-lodges. The president is responsible to the association in national convention for his official acts. In time of contention, also, he is the controlling power, and on important occasions has the benefit of the advisory assistance of the other general officials.

The vice-presidents are delegates-at-large to the annual convention and are the president's deputies in their respective districts, and each has three deputies who report to him every three months. Representatives to the national convention retain their representative capacity for one year, and one of these of each sub-lodge must report quarterly to the official organ of the association, the *National Labor Tribune*, all important news as to the running of their respective mills.

National conventions are held annually on the first Tuesday in June in Pittsburgh. Six weeks prior to the assembling of the convention a programme of business must be sent to each sub-lodge by the secretary of the national lodge. The convention cannot entertain any resolution bearing on a question of law or prices, except such question has been submitted previously to the sub-lodges as stated.

Revenue is provided as described in reference hitherto made to the first constitution, there having been no change in this particular.

The differences between employers and employees are provided for in various ways. In each district there is an Executive Committee, consisting of the vice-president, his deputies and the president of the lodge where any grievance may have arisen, except for the signing of the yearly scales. But no person is allowed to serve as a member of the Executive Committee who is personally or directly interested in such grievance. It is the duty of the vice-president to examine, in conjunction with the Mill Committee, into both sides of any grievance that may have arisen before calling the Executive Committee together to legalize a strike. When a strike has been legalized, the vice-president must notify the general office of the same, in writing; but no sub-lodge is permitted to enter into a strike except by the Executive Committee of the district.

Each sub-lodge must have a Mill Committee consisting of representatives of each department. It is the duty of this committee to superintend and guard the interests of the association in the several departments thus represented, and when it becomes apparent that any advantage is

being taken of the laws or of any member of the association, and the committee of the department where this occurs has failed to adjust the difficulty, then the committees of the other departments, in conjunction with the committee having the grievance, must jointly exhaust every effort with the manager of the works to settle the difficulty before reporting the case to the vice-president of the district. When the Joint Committee, after using all honorable means to bring about a settlement of the difficulty, has failed, the committee must call a special meeting of the lodges in interest, jointly, and all members of those lodges working in the mill affected must be notified by the Mill Committee to attend. At such special meeting the grievance pending must be explicitly stated by the members of the Joint Committee, and, if the Joint Committee consider the grievance sufficient, the corresponding representative of the lodge having the grievance shall, by instruction of his lodge, under its seal and in no other manner, notify the vice-president of the district or division and work shall continue until the vice-president has investigated the case. This officer, in conjunction with the Executive Committee, may declare a strike, and may also declare it at an end if the best interests of the association demand. In either case prompt report to headquarters is required, and then the president, in cases of necessity, has an opportunity to try his personal powers as a peacemaker.

Wherever practicable, steps must be taken to provide a scale of prices for every trade or calling in each district represented in the association. When it is found necessary that the scale of prices governing any department of a mill or factory needs revision such department must submit in writing to the sub-lodge the alterations desired in the scale on or before the first meeting in the month of March, and each lodge must then consider such desired changes, shall vote by ballot thereon and report the result in writing to the general office. When all desired alterations in the scales are received at the general office, which must be by the first Tuesday of April, the same are printed in a pamphlet and a copy is sent to every sub-lodge, and the action taken is carried by the delegates to the national convention. All suggestions pertaining to the scale must be referred to the wage committee, which is called together three or more days before the meeting of the convention, and, in order that this committee may act understandingly, the corresponding representative of each lodge must send to the general office, two weeks prior to the meeting of the committee, a statement giving the condition of their mill, the amount of work done the past year, the feeling of the members of the lodge regarding wages for the next year, stocks in hand, if any, and what kind, and any other information bearing on the subject.

To change the basis of any scale requires a two-third vote of all the delegates present at the annual convention. Except the scale is signed in the conference of employers and employees, three copies must be sent out to each lodge by the general secretary, and when signed one is kept by the firm, one by the sub-lodge, and the third is sent to the general office of the association. The scale, unless signed in conference, must be presented to the manufacturers for signatures by members of the mill committee representing each department of the mill one week prior to July 1, which is the commencement of the scale year, and notice be given by them that unless the scale of prices be signed on or before June 30 all departments of the mill or factory will cease work except roll turners and engineers; but when a stock of muck bar is on hand, and the company does not desire to boil iron, the finishing

mills must run on after the scale is signed, though when ready to boil every man must receive his own job, or if he does not the mill will cease work until he does.

Except on questions of wages regulated by a scale of prices, two weeks' notice is required from employers before a reduction can take place, and two weeks' notice must be given when an advance is requested. When it is found beyond a doubt that any member of the association is working below the price established by it, the men in such mill must cease work until such prices are rectified. No member of the association is allowed to change or alter rules existing in any mill before submitting the desired change to the lodge having control of the department for which the change is intended, and if a majority of all members of the lodge vote in favor of the change the mill committee must notify the superintendent before the same goes into effect.

The laws and rules inculcate sobriety while at work and attention to the interests of employers, and specify that departures from this will not be supported by the association.

An important provision of the laws is that any person employed as foreman, puddle boss, superintendent or general manager of any mill or factory, or holding any of these positions, together with a situation at any of the trades having membership in the association, shall not be eligible to or retain membership. In compliance with this rule, when a member is promoted to a boss-ship he drops his membership, it being recognized that a boss is necessarily in the interests of the employer, and the association policy opposes the individual "serving two masters," as being a bad outlook for either the one or the other.

The first boiling scale, adopted on the 13th of February, 1865, was the following:

Manufacturers.	Boilers.
8½ cents per pound.....	\$9.00
8¼ cents per pound.....	8.75
8 cents per pound.....	8.50
7¾ cents per pound.....	8.25
7½ and 7¼ cents per pound.....	8.00
7 and 6¾ cents per pound.....	7.50
6½ and 6¼ cents per pound.....	7.00
6 and 5¾ cents per pound.....	6.50
5½ and 5¼ cents per pound.....	6.00
5 and 4¾ cents per pound.....	5.75
4½ and 4¼ cents per pound.....	5.50
4 and 3¾ cents per pound.....	5.00
3½ and 3¼ cents per pound.....	4.75
3 and 2¾ cents per pound.....	4.50
2½ cents per pound.....	4.00

When it was adopted, common bar was selling at 7½ cents per pound, but in April the markets declined, falling to 3½ to 4 cents by July, which made the rate for boiling \$5 per ton. The men gave 90 days' notice to terminate the agreement, the prices having recovered in the mean while to figures corresponding with a \$1 rate for boiling. They demanded and got \$8 per ton, this rate prevailing from October, 1865, to October, 1866, when they demanded \$9, which was conceded. In December they were served with notice of a reduction of \$2 per ton, which was refused, a lockout following which lasted until May, 1867, and terminated by the manufacturers' withdrawal of the reduction.

At the close of this serious episode the boilers' organization asked for a conference with the manufacturers for the purpose of arranging a scale that would prevent further differences. This suggestion was accepted, and wages were arranged specially for the time up to the following September, upon the 15th day of which month it was agreed that a scale should go into effect. This scale provided a 25-cent reduction or advance in the price of boiling for each corresponding change of a ½ cent on card rates, the agreement to be terminated upon 30 days' notice by either party. It was in 1871 that it was decided to make the changes by tenths, a ¼ cent per pound advance or recession in the card to carry 10 cents advance or recession per

ton for boiling. Finished bar iron declined from 5 cents per pound in January, 1873, to 2½ cents per pound in the autumn of 1874; demand had dropped, and the prospects were bad. In October the manufacturers requested a conference and gave the 30 days' notice of termination of the scale agreement. They also demanded a reduction of \$1 per ton on the basis of the scale, which would have been, as they put it, a reduction of the basis. After several conferences the boilers proposed a compromise, but the manufacturers declined, and a lockout followed of five months' duration. This was brought to a close by the acceptance of the boilers' terms, and the signing of a scale that provided 10 cents per ton advance or recession with every ⅓ cent. per pound advance or recession in the price of common bar iron and the 30 days' termination clause. In October, 1875, six months after this agreement was made, the manufacturers served notice of termination and called for a conference.

The market was very much demoralized; prices were at almost any figure, except a reasonable one, and card cutting was rife. The price list had receded 2½ cents and there was no outlook that could be defined. From the date of the panic in 1873 on for several years was a period that tried men's souls and tested to the utmost the new method of the arrangement of wages. The conference of 1875 discussed means of tiding over the hard times. A special rate of wages for an especially depressed condition was the object. The manufacturers proposed \$4.50 per ton, and early in December a compromise was reached by which the rate was made \$5 until the 13th of that month and \$4.75 for the two months following. At the expiration of this arrangement, February 14, 1876, the conference conventions reconvened, but, being unable to make an arrangement, the committees separated, so utterly "at sea" that it was understood each firm was to proceed unguided and untrammelled by previous associations and restrictions. The boilers had profited by their union experience and were quick to determine that \$4.75 per ton was the lowest price they would accept. In May another conference was held, but hard times still lingered, and there was no definite conclusion, except "to agree to disagree." The workmen endeavored to have the scale non-terminable for a twelvemonth, the scale year to date from the first day of June. In pursuance of this the scale was accompanied by notice that, unless it was signed by May 31, work would cease on that date. The proposition was rejected, but after two weeks was accepted, and, for the first time in the history of this industry, there was some assurance of work continuing throughout a twelvemonth. Thus the United Sons of Vulcan scored a triumph that has remained with the organization ever since and which has been of the most material advantage to the members, to their employers and to the public, and has been one of the active factors in building a reputation for the association second to that of no other labor organization in the world.

In June, 1877, the yearly scale again went into effect; also in June, 1878 and 1879. In June, 1880, a demand was made for an advance of 50 cents per ton on the 2½-cent basis, and after a few days' stoppage the point was conceded. This scale was in operation for five years, having been re-enacted at each June conference; but in 1885 the minimum was reduced to \$5 per ton for boiling on a 2-cent card. This was changed in the scale of 1887-88 to \$5.50 per ton on a 2-cent base.

The finishers had no scale previous to the amalgamation, except a guide-mill schedule of rates, adopted on April 2, 1872. The association prepared a bar-mill scale

in 1879, which was adopted on the 17th of October of that year. The conference of the committees of the Amalgamated Association and the Manufacturers' Association adopted—June 28, 1886, at Pittsburgh—a scale of prices which included all details of boiling, muck mill, bar and nail-plate mill, guide, 10-inch, hoop and cotton-tie mills, with the different departments of nut iron, channel iron, T-iron angles, clip or wagon strap, hame iron; also plate and tank mills, sheet mills and nail cutting; in fact, all the production of the finishing departments.

Washington News.

(From Our Regular Correspondent.)

WASHINGTON, D. C., August 7, 1888.

The Senate Sub-Committee on Finance are still putting in six hours a day on their revenue reducing and tariff adjusting scheme, with at least a week or 10 days' work ahead. About as near as can be said now, the bill will not be laid before the full committee until their regular meeting next Tuesday, August 14. It is expected that it will engage attention there at least a week, and possibly two, throwing it over to August 21 or 28 before reaching the Senate.

Senator Allison says that he had expected to be able to close the discussion in two or three weeks, but from present indications it would run much longer, as the Democratic Senators intend to give the subject a very exhaustive consideration; they take the President's message and the Mills bill as their line of debate in antagonism to the Senate measure. From the outlook it will be well on toward October 1, if not later, before a vote can be reached. The record on long sessions of Congress has yet a margin of 54 days. The longest continuous sitting of Congress was the first session of the Thirty-first Congress, which met on December 3, 1849, and adjourned September 30, 1850, making 301 days. The present Congress has reached but 247 days. The partisan controversies over slavery questions leading to the passage of the fugitive slave bill and border troubles consumed the time of the national legislators during that long and weary summer sitting. The compromise tariff of 1833 had passed. In 1842, the Whigs being in power, substituted their distinctively protective tariff of that year. In 1846 that measure was supplanted by the Walker low-duty tariff. The tariff under this scheme remained operative until 1857, when a still lower cut was made. From the tariff of 1857 till the Morrill tariff of 1861, a war measure, the country has been nearer free trade than at any time since the act of 1816. There have been 11 sessions of Congress since 1789 which have sat later than August 7.

At the close of the discussion of the Senate, and after the votes shall have been taken, it would not be surprising if the two Houses should get into a wrangle, first in conference committee and then over conference reports, which might protract the tariff controversy down to the day of election in November. After that, whichever way the result may turn by the will of the people, both sides in Congress will doubtless be willing to cry quits.

The inevitable thing in the whole business is that the industrial interests of the country need not anticipate a rest from tariff agitation for at least another Congress. Should the Republicans win they will doubtless consummate their efforts to revise the tariff in the interests of American markets for American products. If the Democrats win the Mills bill will be but a stepping-stone to further pruning of the tariff schedules, and swelling of the free list. Free coal and free iron ore, and a

nominal duty on pig iron, would be the next move.

The present tariff doings in the Senate are purely the political side of the question. The economic phase will not enter into the calculations of the legislators as long as the interests of parties are at stake.

The Life of an Iron Roof.

The Cincinnati Corrugating Company have obtained some valuable information from Mr. W. A. Meninger, of Covington, Ky., who has had upward of 35 years' experience in the roofing trade in that vicinity, on the life of an iron roof. Mr. Meninger stated that in 1856 he put up a corrugated-iron roof on what was then known as the Clayton Young House, at No. 33 West Fifth street, Covington, which is now occupied by the sisters of Notre Dame as a school. This roof did first-class service and gave good satisfaction until about ten years ago, when, upon some changes being made in the building, it was taken off. The material composing it has since been sold to different parties and is now in use for covering various sheds, stables and other small buildings in Covington and vicinity. In 1861 Mr. Meninger covered the Charles Whitcomb House, adjoining the Fourth Street Presbyterian Church, with corrugated iron. This roof is doing perfect service to-day. The expense for repairs, and even repainting, has been hardly worth mentioning.

In 1863 he put a similar roof of corrugated iron on a brick building erected for Mr. George Phillips, who then owned the property, the lot being now occupied by the Fourth Street Presbyterian Church. Mr. Phillips manufactured and prepared the materials himself in his rolling mill. The building has been used as a dwelling house most of the time since then, and this roof has answered its purpose admirably. It is now in a remarkably good state of preservation, considering that it has had no attention in the way of repairing for a number of years.

Mr. Meninger also cited the history of a number of old-time iron roofs with which he is personally acquainted. The old Howe warehouse on Market space had over it for over 30 years an iron roof. After affording complete protection for this long period, and over an almost flat surface, it was removed about three years ago. The Licking Rolling Mill has a corrugated iron roof which has been on it for over 25 years, and to Mr. Meninger's certain knowledge, it has never had a coat of paint since it was first put on. The Kentucky Central Railroad shops in Covington were originally furnished with a corrugated-iron roof, which remained for over 23 years in a good state of preservation, and was only recently removed on the occasion of some repairs and changes.

Mr. Frederick Siemens, writing to the editor of *Iron*, states that in the new Siemens furnaces, introduced since 1883, which are heated by radiation, the consumption of fuel is found to be reduced to less than 8 cwt. of small coal to the ton of steel ingots produced. This saving in fuel is combined with the further advantage that the steel made is much more free from blowholes than that made in furnaces heated by contact of flame, the finished metal being therefore stronger. In the older form of open-hearth furnaces 150 charges were regularly made without a stoppage, and in the furnaces heated by radiation a much greater number of charges are made. At several works over 300 charges have been made without repairs; at one works 440 charges were made, and at another works a furnace had worked for 12 months, making two charges per 24 hours, without stoppage for repairs.

CHILI.

VALPARAISO, June 8, 1888.—*Copper*.—Now that the difference in price between spot and futures has ceased, the mining companies' agents have been more inclined to do business, and large sales have been made by them at gradually hardening rates. In this manner June shipments have been all disposed of, together with the major portion of July, while for August there are only buyers at lower rates. For the moment the market has consequently relapsed into quietude. Sales for the fortnight sum up 31,400 quintals, at \$28.60 @ \$30.60, \$30.25 equaling £76. 31/ with 23/6 freight. *Nitrate*.—Some 884,500 quintals changed hands at \$2.70, spot, and \$2.75, futures, 95 %, \$2.70 equaling 8/3 1/2 cwt., with 30/ freight. May shipments to Europe reached 42,000 tons, and to the United States 4500; loading June 1, 25,000 and 4500 respectively; charters, 16,200 and 4000. *Coal* is stiff, arrivals from England and Australia being delayed, and domestic production diminished, Newcastle ranging from 55/ to 37/6, and Australian 38/ to 35/, as to time of sailing. *Exchange*, 25 1/2 d.—*Weber & Co.*

EAST INDIES.

SINGAPORE, July 31, 1888.—*Tin*.—The July shipments from the Straits Settlements to the United States amounted to 300 tons, against 200 last year; since January 1 to 1150, against 2800; to England in July to 600, against 900, and since January 1 to 10,600, against 7500.—*Giffillan, Wood & Co., to Charles Nordhaus, New York, per cable direct.*

MANILA, July 30, 1888.—*Hemp*.—There are buyers at \$9.50, against \$9 same date last year, equaling 1/2 ton cost and freight £32, against £30. 8/8. Cleared for the United States since January 1, 115,000 bales, against 125,000; loading for do., 3000, against 11,000; cleared for England since January 1, 206,000, against 121,000; loading for do., 15,000, against 16,000; cleared for all other ports, 45,000, against 24,000; receipts at all other ports since last cable, 9000, against 9000; do. since January 1, 337,000, against 226,000 and 224,000 the previous two years. *Freight*, \$6, against \$5. *Exchange*, 3/5 1/2, against 3/5 1/4 last year.—*Ker & Co. to Charles Nordhaus, New York, per cable direct.*

COLOMBO, June 21, 1888.—*Plumbago*.—Has been moderately active and steady. We quote to-day per ton in rupees: Large lumps, 145 @ 160; Ordinary ditto, 125 @ 150; Chips, 80 @ 95, and Dust, 40 @ 65. Following have been the shipments since October 1, 1887: To England, 54,546 cwt.; to Marseilles 38; to Trieste, 419; to Hamburg, 6955; to Antwerp, 3189; to Bremen, 1012; to India, 82; and to the United States 98,914; together, 165,155, against 181,381 last year, 133,564 in 1886 and 131,509 in 1885. We quote *Cott's Yarn*, No. 1 to 3, 7 to 12 rupees 1/2 cwt. *Exchange* 1/4 1/2.—*Volkart Bros., through Mr. John W. Greene, Agent., 82 Wall street.*

GERMANY.

HAMBURG, July 28, 1888.—*Iron*.—The demand for Pig on the part of rolling mills has not yet increased and stocks are gradually accumulating; at the same time Iron Ore is less firm. Only the production of Bessemer Pig was diminished somewhat. The Rhenish-Westphalian syndicate still upholds the price for Pig, but at Siegen a marked anxiety is shown to sell, and this competition causes a feeling of weakness. The makers of Spiegel still have a good many orders to attend to; some have booked enough to last them for the remainder of the year. At the same time stocks are not unwieldy, so that in spite of a falling export demand the price of 56 marks per ton is kept up for 10 to 12 %. At Siegen Forge Pig may be had for 47 @ 48 marks. Bessemer and Thomas continue wanted. Luxembourg Forge Pig remains 38.70. As for the rolling mills in Rhenish-Westphalia, they are kept tolerably busy in filling domestic requirements, but absolutely nothing transpires for export, a thing leading to a good deal of complaint, but not of uneasiness, since many makers have sold at home all they can turn out till October 1. As the building season is rather lively, Beams continue selling with great ease. Boiler makers are as well looked as before, but the demand for Thin sheets is slack still. Though by no means active, the least so for export, the Wire branch seems to be of good

cheer. Machine shops, foundries and car works maintain a fair amount of liveliness. The car shops boast of three times the volume of trade they had last year. Wire Rods are selling at 121 marks, Bessemer Steel Billets at 135.—*Borsenhalle.*

RUSSIA.

ST. PETERSBURG, July 26, 1888.—*Hardware*.—Russian Hardware, Brass Goods, Glassware and China are being shipped in large amounts to Persia. This Russo-Persian trade is pushed with great vigor by Korschine & Co.; who have succeeded in opening at Teheran, the capital of Persia, a Russian exhibition of similar wares and are besides making great efforts to get the concession from the Persian Government for a railroad line to connect the southern shore of the Caspian with Teheran, a company of Russian capitalists being ready to build the same.—*Journal de St. Petersburg.*

Comparative Cost of Lighting by Electricity and Gas.

A careful test was made in October last at the Grand Central depot, in Cincinnati, Ohio, to determine the comparative cost of lighting by electricity and gas, and a summary of the result was recently published. This states that these tests were carried on for 16 days, the first eight of which were assigned to the gas company and the remaining eight days to the electric light company. The steam used for operating the elevator pumps and for heating purposes was taken from a separate set of boilers, leaving one set to be used exclusively in furnishing steam to the engines driving the dynamos, and the cost of which was:

Coke used per fortnight, including starting fires, 920 bushels, at 7 cents.....	\$65.03
Water to boilers, including waste for cleaning boilers, &c., 38,408, at 9 cents per 1000 gals.....	3.50
Wages—two firemen, one day and one night.....	24.00
Interest on investment and depreciation of boilers and fixtures.....	5.00
Total.....	\$97.53

To ascertain the cost per annum, the ratio of lighting hours which these days bear to the entire year has to be determined; both the bills for electric lighting and the lighting time table of the gas company show the dark hours of October to be one-tenth of the entire year, which, taken as the basis of calculation, make the actual cost of steam supplied by the depot company for one year \$3895. The charge for electric light, exclusive of steam supply, is based upon the weight of zinc in grammes (15.44 pounds) deposited during any interval of time, multiplied by the constant 17 grammes, the number of so-called thousand candle-power of light furnished for the interval, and for which they charge, according to their contract, 37 cents per so-called candle-power. The cost for October thus calculated was \$665.75, or total cost per annum, exclusive of steam, \$6659. The actual amount charged for 1886 by the electric light company was \$15,086, while the cost of one year's illumination of the depot—according to this list—was \$10,654. This discrepancy, as shown by the list, between the cost and the actual previous charge, cannot be reconciled by any possible change of conditions or any known method of computation, and shows that either during the test some method was successfully adopted with a view of materially reducing the apparent cost of electricity or that the charge heretofore made for an equal degree of illumination has been disproportionate to the service rendered.

The average illuminating power of all the lights used in the depot, buildings, &c., was equivalent to 185.15 lights of 16 candle-power each, or 29,624 power. The tests of the gas showed it to be of 16.94 candle-power. The total registered quantity of gas passing meters during the eight days' test was 214,700 cubic feet, of which the amount used for illuminating purposes

was 196,700 cubic feet, which cost for October \$911, or for the entire year, \$9,107.50. From the tests it follows that the same degree of illumination can lighten with gas that was given by electricity with a saving of 27.72 per cent. That using gas without limitation, affording a higher degree of illumination, the expense would be nearly 40 per cent. less than the cost of electric lighting in 1886. Apart from the cost of the light produced by the electric plant, there are other interesting facts. During the weighing of the zinc plates of the voltmeters, it was found that the diminishing plate gained in weight instead of losing, as it should if the meter is working properly, showing a reversal of current. This fact indicates a state of affairs very dangerous to the pocket of the consumer of electric light, for if the meters will work backward, they may work forward at a rate greater than that assigned by theory, and cause a registration of more light than is furnished.

Another fact is the great range in candle-power of the lights caused by a slight change in the intensity or pressure of the electric current. Thus the (D) 32 nominal candle-power lamp, having the filament at an angle of 45° to the place of the photometer bar with a resistance producing 99 volts, the current was 1.05 ampere and the candle-power was 23.94, where, with a slightly increased resistance, the current was 1.268 ampere and the candle-power 42.80. The reduction of the current and resistance diminishes the load on the dynamos and engines, prolongs the existence of the lamp, and materially diminishes the illuminating effect. If the pressure of the electric current is reduced below 99 volts the illumination produced will be greatly reduced below the standard, while the cost to the consumer may be practically unchanged. The cost is about the same for a strong as for a weak light, or while the illuminating effect steadily diminishes with use, the current to maintain its incandescence remains substantially constant, and consequently the cost to the consumer becomes greater with a lower candle-power. With the Edison light a reduced brilliancy is not accompanied by a reduction of expense, but under certain conditions of lamp and service the cost may be greater for a light of 16 candle power than for one of twice the brilliancy. Changing the position of the filament (loop) of the lamp under same conditions of current and pressure produces a reduction of 50 per cent. in the illuminating power. The most startling result of the tests, says the *Progressive Age*, is the loss of over 60 per cent. in effect between the driving engines and the lamps. In almost any other application of steam-power to useful work, the relation of the work done to the power expended in doing it must be much greater to be economical. With gas or kerosene a given consumption of illuminating substances furnishes a constant power of light, while a diminished brilliancy of light is always accompanied by a reduction in the consumption of illuminating material and a corresponding reduction of cost.

It is reported from Fall River, R. I., that a syndicate composed of three capitalists of national reputation, whose names are for the present withheld, has been looking over the field for the establishment of a big steel plant in New England, and have decided to locate in Fall River if a suitable site can be obtained. Such a site, in their opinion, is the wharf and lumber yard property of Cook, Borden & Co., on Davol street, for the purchase of which negotiations are now pending. The syndicate propose to invest \$1,000,000 in the purchase of a site, erection of a plant and development of the works, and will give employment to 800 hands when in full operation.

TRADE REPORT.

Philadelphia.

Office of *The Iron Age*, 220 South Fourth St.,
PHILADELPHIA, Pa., August 7, 1888.

Pig Iron.—The market has shown but little change during the week, and is practically in about the same position as then noted. Good brands are still in light supply and there is a gradual movement toward somewhat higher prices, although as yet there is no quotable advance. The demand is perhaps not quite as active as it was a couple of weeks ago, as a good many orders were placed at about that time, and those who are in the market now do not fall in with the idea of paying higher prices, and are therefore either taking small lots or postponing entirely until something more definite can be learned in regard to the position. At the moment, however, sellers have the advantage, and those controlling desirable brands are getting advances varying from 25 to 50 cents above the lowest rates ruling during June and July, while those who at that time cut under the market are now pretty firm at quoted prices, and not inclined to sell for any delivery beyond September. This statement probably conveys all that can be said in favor of the market, except that stocks are light, and that the demand promises to be maintained on its present basis, with some chance of its being increased. From a buyer's standpoint, things do not appear quite so favorable. There is no improvement in the price of Finished Iron, neither is the demand of a character to cause any very hopeful feelings as regards prices, consequently the demand for an advance on Pig Iron does not meet with much response. Furthermore, Iron can be had at the old prices, providing that consumers are willing to try new brands, and while this alternative is not very readily accepted it has its influence in more ways than one. For instance, make the price of a new brand a little lower, or make the old one a little higher, and a decision will soon be reached. There are still other reasons why buyers delay placing their orders at advanced prices. Western mills just starting up have been heavy buyers during the past two or three weeks, and having placed their orders, there may be now, as there was before they shut down, more or less surplus for Eastern markets. These are points which consumers would like to see cleared up before committing themselves to an advance, especially as they see no indications of better prices for their own products. But the position is undoubtedly better than it was some time ago, although as we have tried to show, the question as regards the future is still largely in abeyance. Meanwhile, there is a disposition to look for improvement, and it would not require much to bring about results of that character. Sales during the week have generally been small lots at prices ranging from \$18 to \$19 at tide, for No. 1 Foundry; \$17 to \$17.50 for No. 2, and \$16 to \$16.25 for Gray Forge. Southern Irons neglected, but could probably be had at 50¢ to \$1 1/2 ton less than quoted for Pennsylvania or Virginia Irons.

Foreign Iron.—Prices are entirely nominal, as there is no demand at present. Asking prices are as follows: Bessemer, \$19 @ \$20, c.i.f., duty paid, and 20 ¢ Spiegel, \$26 @ \$26.50.

Blooms.—There is something of a scarcity of Nail Slabs, and while quotations are unchanged it is not easy to get prompt deliveries. Prices about as follows: Slab and Billets from \$29 to \$35, f.o.b. cars at mill, according to analysis;

Charcoal Blooms, \$52 @ \$54; Run-out Anthracite \$42 @ \$44; Scrap Blooms, \$33 @ \$35 1/2 "bloom" ton of 2464 lb. Foreign at tide, c.i.f., duty paid, \$29 @ \$30 for Nail Slabs; \$31.50 @ \$32.50 for 4 x 4 Billets, and \$35 @ \$39 for Siemens-Martin, price according to analysis, &c.

Muck Bars.—There is more inquiry, and with light offerings prices are firm at from \$27.50 to \$28, delivered, or \$26.50 @ \$27.50 at mill, according to location, &c.

Bar Iron.—There is a fair amount of business on hand, and mills are kept fully employed in one way or another without accumulating much work for later delivery. In other words, large lots are not called for, so that a continuance of the present activity can only be maintained by a steady flow of orders from week to week. In the meantime, however, there is plenty of business, with a fair probability of increasing activity as the season advances. But prices have not improved, and are hardly likely to do so until the mills get more work ahead. Hand-to-mouth business is well enough in its way, but heavy buying is indispensable to an advance in prices, hence manufacturers do not as yet feel sufficiently confident of their position to warrant them in asking more money. Still considerations are in that direction, and to that extent the outlook indicates confidence in present quotations, and hopefulness in regard to the future. As mentioned last week quotations cannot be given with much exactness as there all sorts of prices, all sorts of Iron and all sorts of orders. In a general way 1.75¢ @ 1.85¢ covers both extremes of the market, but all depends on the size of order, quality of Iron, &c. Skelp Iron is said to be a little dearer—in any case manufacturers are asking 1.82 1/2¢ @ 1.85¢ for grooved, but it remains to be seen whether buyers will respond.

Plate and Tank Iron.—There is a trifle more inquiry, and it is likely that some fair sized orders will be placed during the week. The mills have very little work on hand, however, and there are plenty of sellers at quoted rates. The outlook indicates a moderate consumption during the fall months, but no material change in prices is looked for until the volume of business assumes larger proportions. Asking rates are about as follows: Ordinary Plate and Tank Iron, 1.95¢ @ 2.05¢; Shell, 2.4¢ @ 2.5¢; Flange, 3.5¢; Fire-Box, 4¢; Steel Plates, Tank and Ship Plate, 2.3¢ @ 2.4¢; Shell, 2.7¢; Flange, 3¢ @ 3 1/2¢; Fire-Box, 3 1/2¢ @ 4 1/2¢.

Structural Iron.—The demand is rather light at present, and mills are beginning to run short of work in some of their department. Orders are chiefly for small lots, although one sale amounted to about 900 tons, delivery to be taken late in the fall. Prices are unchanged as follows: 2¢ @ 2.10¢ for Bridge Plate; 2¢ @ 2.10¢ for Angles; 2.6¢ @ 2.7¢ for Tees, and 3.3¢ for Beams and Channels. Iron or Steel.

Sheet Iron.—The demand keeps up very fairly, and while there is the usual irregularity in prices, owing to the difference in quality, good makes command full prices, which for small lots are about as follows:

Best Refined, Nos. 26, 27 and 28... 3 1/4 ¢ @ 3 1/2 ¢
Best Refined, Nos. 18 to 25... 3 ¢ @ 3 1/4 ¢
Common, 1/2 ¢ less than the above.
Best Bloom Sheets, Nos. 20 to 28... 4 1/4 ¢ @ 4 3/4 ¢
Best Bloom Sheets, Nos. 22 to 25... 4 ¢ @ 4 1/4 ¢
Best Bloom Sheets, Nos. 16 to 21... 3 1/4 ¢ @ 3 3/4 ¢
Blue Annealed... 2.8 ¢ @ 3 ¢
Best Bloom, Galvanized, discount... 62 1/2 ¢
Common, discount... 67 1/2 ¢

Merchant Steel.—Trade is beginning to improve in this department, and mills look forward to a heavy fall trade. Prices are quoted for lots from store as follows: Tool Steel, 8 1/2¢; Machinery, 7, 8¢; Crucible Spring, 4 1/2¢; Open-Hearth Ord-

nary Spring, 2 1/2¢ @ 2 3/4¢; Crucible Machinery, 5¢; Best Sheet Steel, 10¢; Ordinary Sheet, 8¢.

Steel Rails.—Only small sales are reported in this market, \$30 at mill being the usual quotation. Sales are reported to have been made in some cases at less money, but the feeling is firmer, and it is claimed that about \$30 would now be a firm quotation on the very best class of orders.

Old Rails.—Nothing doing in spot lots. Sales for delivery at mills in the interior have been made at from \$22 to \$23, which are now firm quotations, as the offerings are very light.

Scrap Iron.—Market dull, and prices irregular. Small lots of good quality command about the figures quoted below, say \$18 @ \$19 for cargo lots; \$20 @ \$21 for carload lots, delivered, or for choice \$21.50 @ \$22; No. 2 do., \$14 @ \$15; Turnings, \$13 @ \$14; Old Steel Rails, \$19 @ \$20; Cast Scrap, \$14 @ \$15; do. Borings, \$9 @ \$10; Old Fish Plates, \$24 @ \$25. Old Car-Wheels, \$17 @ \$18, Philadelphia, or its equivalent.

Wrought-Iron Pipe.—No change to note in this department. Business still continues good and prices fairly satisfactory. Discounts are quoted as follows: Black Butt-Welded 55 ¢; on Galvanized do., 45 ¢; on Black Lap-Welded, 65 ¢; on Galvanized do., 52 1/2 ¢; on Boiler Tubes, 60 ¢.

Nails.—There is some trade doing in small lots, but generally speaking trade is very dull. Price is quoted at from \$2 to \$2.10 from store, with the usual discount for carload lots.

Pittsburgh.

Office of *The Iron Age*, 77 Fourth Ave.,
PITTSBURGH, August 7, 1888.

The general industrial situation, while not improving as rapidly as could be desired, is improving nevertheless, and the outlook for a good fall trade is encouraging. Labor complications are not as numerous as they have been. With few exceptions, the Iron mills have signed the wage scale and started up, and in other branches of manufacturing there is now but little trouble between employers and employees. Iron manufacturers claim that the cost of labor is much greater here than east of Pittsburgh, and that Eastern competitors have a decided advantage over them in this respect, and this was the principal reason for a reduced wage scale.

Pig Iron.—The activity noted for some weeks past continues; there is no trouble in finding buyers for all the Iron that is being offered within the range of our quotations. Furnacemen are not as free sellers as they were a month ago; the most of those whose furnaces are in blast are pretty well sold up, and then the feeling obtains that better prices are likely to be obtained before long. Since our last report sales of Mill Irons have been made at an advance of 25¢ @ 30¢ 1/2 ton, and those furnacemen pretty well sold up are refusing to make additional sales, from which it is evident that they anticipate still higher prices. The market is in that peculiar condition now that furnacemen are more disposed to sell for immediate than future delivery, while consumers are more anxious to anticipate future than present wants. Stocks in first hands, are comparatively light, the surplus having been pretty well picked up. Some furnacemen are very confident of considerably higher prices in the near future, while others, equally well informed, are not so extravagant in their expectation. It is very generally admitted, however, that there is little or no margin for profit at present prices, and it is not

strange, therefore, that an advance is looked for. We quote prices as follows:

Neutral Gray Forge.....	\$14.00 @ \$14.75,	cash
All Ore Mill.....	15.50 @ 16.00,	"
White and Mottled.....	13.75 @ 14.00,	"
No. 1 Foundry.....	16.75 @ 17.00,	"
No. 2 Foundry.....	15.50 @ 16.25,	"
No. 3 Foundry.....	14.75 @ 15.00,	"
Charcoal Foundry.....	20.00 @ 23.00,	"
Cold Blast Charcoal.....	25.00 @ 28.00,	"
Bessemer Iron.....	17.00 @ 17.25,	"

The only sale of Bessemer Iron reported was a lot of 2000 tons at \$17.25 cash, which is the top of the market at present.

Muck Bar.—There is more inquiry and the market is firmer, in sympathy with Pig Iron. We now quote at \$26.25 @ \$26.75, cash, as to quality and delivery.

Manufactured Iron.—There is an improved demand; orders are coming forward more freely, the mills have nearly all resumed operations, and some of them are reputed as having about all they can do. No change in prices: Bars, 1.70¢ @ 1.80¢; Plates, 2.15¢ @ 2.20¢; No. 24 Sheet, 2.70¢ @ 2.80¢, all 60 days, with usual discount of 2 % off for cash. The outlook is favorable for a good fall and winter trade, and this has had considerable to do with causing the mill owners to sign the wage scale and hurry up in starting up their mills—they were anxious to hold their trade, realizing as they do that it is easier to lose desirable customers than to obtain them in these days of active and sharp competition.

Nails.—The card price remains unchanged, and manufacturers here are still refusing to cut below the card, but buyers are able to do better elsewhere, and Pittsburgh makers, owing to their refusal to cut, are doing little or nothing. We continue to quote upon a basis of \$1.90 for 12d. to 40d., 60 days, 2 % off for cash, but orders are being taken west of here as low as \$1.80 and even \$1.75, at which prices Pittsburgh manufacturers can see nothing in the business, and, as already noted, there are very few Nails being made here.

Wrought-Iron Pipe.—There is an increased demand for Pipe; some few of the mills are pretty fully employed, and while prices remain unchanged the market is firmer. It looks now as if the last half of the year would be better than the first half of the year. In addition to regular trade, which has improved considerably, natural gas companies are buying more freely, and now and again we hear of pretty good sized orders being on the market. Prices, however, while firmer, are unsatisfactory, but if the present demand continues, an advance will no doubt be established. The Manufacturers' Association will have to be revived, however, before any regular advance can be made; there has not been a meeting of the association, we believe, since last fall. We continue to quote discounts off regular list as follows: Black Butt Welded Pipe, 60 %; do., Lap Welded, 70 %; Galvanized Butt, 55 %; Galvanized Lap, 60 %; Boiler Tubes, 65 %; Casing, 85¢ @ foot, net; 2-inch Tubing, 11¢.

Old Rails.—There is an increasing inquiry, and, with light offerings, the market is firmer. We are advised of sales of 1000 tons American Tees at \$21. Some sellers are now refusing to accept less than \$21. The starting up of the mills in the Shenango and Mahoning Valleys has stimulated the demand considerably, as there are more consumed out there than almost anywhere in the country.

Steel Rails.—New business continues light, but the mill here still has all it can attend to working up old orders. Prices are still quoted at \$31 @ \$31.50, cash, on cars at mill, but it is still intimated that for a desirable order the prices quoted would be shaded. There is a possibility that the last half of the year will wind up better than the first half.

Railway Track Supplies.—No change in prices. Spikes, 2¢, 30 days, delivered; Splice Bars, \$1.75 @ \$1.85; Track Bolts, \$2.85 with Square and \$2.95 with Hexagon Nuts.

Billets, &c.—Bessemer Steel Billets are quoted at \$28.25 @ \$28.75, delivered; sale of Steel Nail Slabs at \$28.45; sales of Rail and Bloom Ends at \$17.25 @ \$18; 1000 tons domestic Bloom Ends at \$18. There has been an increased demand within the past week or two.

Merchant Steel.—There is a fair business at unchanged prices. Best brands of Tool Steel, 8½¢; Crucible Spring, 4½¢; Crucible Machinery, 5¢; Open-Hearth, 2½. Singer, Nimick & Co.'s is now a full-fledged non-union mill; the firm report that everything is running satisfactorily about the mill, many of the old hands having resumed their positions.

Old Material.—There is an increased demand for all kinds of Old Material, but prices remain unchanged. Sales No. 1 Wrought Scrap at \$19, net ton; Car Axles at \$22.50 @ \$23; Cast Scrap, \$14.50 @ \$15, gross ton; Old Car Wheels, \$20; Cast Borings, \$11.50 @ \$12; sales several thousand tons Scrap Steel at \$16.50 @ \$16.75, gross.

Chicago.

Office of *The Iron Age*, 95 and 97 Washington St., CHICAGO, August 8, 1888.

Pig Iron.—Some heavy transactions in Lake Superior Charcoal enlivened the market last week, and it is believed that by this time the majority of the large consumers of this class of Iron have covered their requirements for the greater part of the coming year. A rumor is in circulation that speculators are endeavoring to secure control of the Charcoal Iron trade, with a view to advancing prices on the remaining buyers, but the report is discredited by those in a position to be thoroughly posted. At the same time it is highly probable that the low prices on which some transactions were based will not be duplicated this season. The furnace companies are now in a position to insist on better rates and they are stiffening the views of their agents. The demand for Coke Irons is fair, but no marked activity has developed, although buyers display a little more confidence in the maintenance of prices, and anticipate their wants to a moderate extent. Much irregularity prevails in Coke Iron prices, some furnaces with well-filled order-books having advanced their rates, while others continue to name the old figures. Contracts for considerable quantities of Bessemer Iron have been taken by the Steel-Rail manufacturers, whose furnace capacity exceeds their present demand for Rails. Cash quotations are as follows, f.o.b. Chicago: Lake Superior Charcoal, all numbers \$18.50 @ \$19.50; Alabama Car-Wheel, \$26.25; Southern Charcoal Foundry, No. 1, \$18 @ \$19; Jackson County Softeners, No. 1, \$17.50 @ \$18.50; Hocking Valley, Soft Foundry, No. 1, \$16.50 @ \$17.50; American Scotch (Blackband) No. 1, \$18 @ \$18.75; other Ohio Scotch Irons, No. 1, \$17.50 @ \$18; Lake Superior Coke, No. 1, \$17 @ \$17.50; No. 2, \$16 @ \$16.50; No. 3, \$15 @ \$15.50; Southern Coke, No. 2, \$16.50 @ \$17; No. 2½ and Open Bright, \$16 @ \$16.50; No. 3, \$15.50; No. 1 Mill, \$15; No. 2 Mill, \$14.50.

Bar Iron.—The heavy orders alluded to in previous reports are understood to be still held under consideration, with a probability that they will be placed this week. The carload price of Common Iron is 1.62½¢ @ 1.65¢, half extras, f.o.b., Chicago, but an upward tendency is visible in many quarters, with mills rapidly filling up

with work from this and other sections. Store prices are not so high as they were during July, quotations now ranging from 1.75¢ to 2¢, according to quantity and quality.

Structural Iron.—Considerable business has been done in bridge material, and the demand for Beams for building purposes is steadily maintained. Gottlieb & Co. secured the contract for the Lincoln street Steel viaduct, 246 feet long, for \$35,074. Twelve bids were submitted, those naming Iron being highest. Great trouble is experienced among contractors for the erection of large buildings in getting deliveries of Steel Beams. Quotations on Mill lots are as follows: Angles, 2.20¢; Universal Plates, 2.35¢; Tees, 2.45¢; Beams, 3.40¢, all f.o.b. Chicago. From store the following rates are charged: Angles, 2.40¢ @ 2.70¢; Tees, 2.60¢ @ 2.90¢; Beams and Channels, 3.80¢.

Plates, Tubes, &c.—A good steady demand is reported for Plates, but no large contracts were made. Tubes are a little firmer. Store prices are as follows: Heavy Sheets, Nos. 10 to 14, 2.65¢; Tank Iron, 2.55¢; Tank Steel, 2.80¢; Shell Iron, 3¢; Shell Steel, 3.25¢; Flange Iron and Steel, 4¢; Fire-Box Steel, 4.75¢ @ 5.75¢; Boiler Rivets, 4¢ @ 4.25¢; Ulster Iron, 3.75¢; Boiler Tubes, 60 % and 10 % off on 2½-inch and larger and 62½ % off on 2-inch and smaller.

Sheet Iron.—A few orders have been taken by manufacturers' agents at 2.95¢, f.o.b., Chicago, for No. 27 Common, but the inquiry has not been brisk. Jobbers still quote 3.10¢ @ 3.20¢ from store for small lots of No. 27, and report an excellent demand from consumers.

Galvanized Iron.—Manufacturers' agents find a very steady trade in progress, all classes of their customers buying freely. Small lots of Juniata are quoted at 60 % and 5 % off, and Charcoal at 60 % and 10 % off.

Merchant Steel.—A very satisfactory business has been transacted in some lines, but it is reported that Sleigh and Toe Calk Steels are now selling very low, competition on this class of trade being heavy. Store rates are unchanged as follows: Bessemer Bars, 2.30¢ @ 2.50¢; Tool Steel, 8½¢ @ 9½¢; Specials, 13¢ @ 25¢; Crucible Spring, 4.40¢; Open-Hearth Spring, 2.90¢; Open-Hearth Machinery, 2.75¢ @ 3¢; Crucible Sheet Steel, 7¢ @ 11¢.

Steel Rails.—No transactions have come to light since last report, and sales of Bessemer Pig by some of the local Rail manufacturers give color to the statements made of the scarcity of Rail orders. Quotations range from \$31 to \$31.50 for orders of moderate size, while carload lots sell at \$32 @ \$35, according to circumstances.

Old Rails and Wheels.—Old Iron Rails in this market are quoted at \$19 @ \$19.50, with these prices bid for quantities, although large consumers state that they have been able to supply their needs at \$18. Old car-wheels now command \$19, sales being reported at this price.

Scrap.—Very little inquiry has been made for anything except cheapest grades of material. Mixed Country Scrap is quoted at \$11 @ \$11.50. Selling quotations for carefully selected are as follows, ½ ton of 2000 lb.: No. 1 Forge or Railroad Shop, \$16.50 @ \$17; Track, \$16; No. 1 Mill, \$12 @ \$12.50; Light Wrought, \$8; Horseshoes, \$16.50; Axles, \$22; Cast Machinery, \$12 @ \$12.50; Stove Plate, \$9.50 @ \$10; Cast Borings, \$8 @ \$8.50; Wrought Turnings, \$10; Axle Turnings, \$11.50 @ \$12; Coil Steel, \$13; Leaf Steel, \$14; Locomotive Tires, \$14.

Hardware.—The demand for Shelf Hardware continues excellent, being almost too strong for the excessively hot weather now prevailing, taxing the endur-

ance of the clerical force. Fall goods are moving very freely, but staple goods are also in constant request, orders being well distributed over the stock. In Heavy Hardware fully as much trade is being done as a year ago. Prices show very little change. Bolts and Nuts are a trifle weaker, but Wagon stock generally is very firm.

Nails.—An increased inquiry and an active demand for Steel Nails are reported by manufacturers' agents. Some of them had the best trade last week they have enjoyed for a long time. Buyers seem to have decided that prices are now low enough to take hold and they have placed some very heavy orders. The usual price paid was on the basis of \$1.75 Wheeling. Jobbers quote \$2.05 from store for small lots of Steel Nails, and \$2.50 @ \$2.60 for Wire Nails.

Barb Wire.—Nothing new has occurred in this line, trade being very quiet. Jobbers quote small lots of Painted at 3¢, and of Galvanized at 3.75¢.

Pig Lead.—Sales of over 800 tons are reported, principally of Common, at 3.90¢ @ 4.05¢. The available supply in the West is said to be limited, and as consumers are buying liberally it seems probable that spot Lead will shortly command a premium. Speculation is now also an important influence in determining values in the leading trade centers of the country.

Cleveland.

CLEVELAND, August 6, 1888.

Iron Ore.—Sales of Gogebic Bessemer are reported this week at \$5 ½ ton, and an especially rich lot is said to have brought \$5.15 f.o.b. cars, Cleveland. Menominee non-Bessemer are said to have been sold for \$4, although the report lacks verification. The tendency of the market is certainly toward higher prices, however, and all Ores in any demand whatever command better figures than prevailed two weeks ago. Lake freights are partially responsible, the rate from Escanaba having advanced to \$1, and from Marquette to \$1.25. The fear entertained at the beginning of the season that the mining companies would not find a market for all their Ore no longer exists. The furnace-men seem likely to require an amount of Ore considerably in advance of the contemplated output. If prevailing Lake freights could be guaranteed for the remainder of the season, operators would have no hesitancy in increasing the forces at the mines. The best authorities estimate the sales to date at 3,000,000 tons, the actual transactions probably exceeding that figure by a few hundred thousand tons. Quotations are:

No. 1 Specular and Magnetic Bessemer Ore.....	\$5.50 @ \$6.00
No. 1 Specular and Magnetic Non-Bessemer Ore.....	4.75 @ 5.00
Red Hematite Bessemer Ore.....	4.50 @ 5.00
Red Hematite Non-Bessemer Ore.....	3.50 @ 3.75
Menominee Range Bessemer Ore.....	4.75 @ 5.10
Menominee Range Non-Bessemer Ore.....	3.50 @ 3.75
Gogebic Range Bessemer Ore.....	4.75 @ 5.15

Pig Iron.—The market continues to improve in tone. Buyers are purchasing freely, not only the amount of Pig Iron needed for immediate use, but quantities sufficient to cover all positive future needs. They are possibly inclined to move thus vigorously because prices are low, and sellers are disinclined to ask for an advance. If the present demand continues it may be found necessary to make higher quotations. Charcoal Irons in all numbers are selling freely, and Foundry Irons are eagerly asked for. The following are quotations:

No. 1 to 6 Lake Superior Charcoal.....	\$20.50 @ \$21.50
No. 1 Strong Foundry, Bessemer quality, ½ ton.....	17.25 @ 18.25
No. 1 Strong Foundry, ½ ton.....	17.00 @ 17.75

No. 2 Strong Foundry, ½ ton.....	16.00 @ 17.00
No. 1 American Scotch, ½ ton.....	17.50 @ 18.00
No. 2 American Scotch, ½ ton.....	16.50 @ 17.00
No. 1 Soft Silvery, ½ ton.....	17.50 @ 18.50
Mahoning and Shenango Valley Neutral Mill Irons, ½ ton.....	@ 14.75
Mahoning and Shenango Valley Red Short Mills, ½ ton.....	@ 15.25

Scrap Iron.—Scattering sales of Old American Rails at \$20.50 are reported. A local firm reports the sale of 500 tons of No. 1 Wrought at \$17.50.

Nails.—A few stock sales of Steel Nails at \$2, and of Steel Wire Nails at \$2.50 are reported. Iron Nails are held at \$1.90, with but little doing.

Barb Wire.—Only a few sales are taking place at 3.10¢ for Painted, and 3.75¢ for Galvanized.

Cincinnati.

CINCINNATI, August 6, 1888.

Pig Iron.—A confident feeling, increased activity and higher prices have been the features of prominence in the local Pig-Iron market during the past week. Sellers have been less anxious to sell, while buyers have been more urgent to buy. Early in the week furnaces met the advances of consumers at previous prices, but, as the week progressed, prices ruled 25¢ @ 50¢ ½ ton higher, and at the close a still further advance is asked; furnaces are disposed to withdraw from the market upon special brands, even at the higher prices asked. The volume of business has been large, and, while mainly for foundry grades, the demand for Mill Iron has been active and sales comparatively small, only on account of the difficulty in obtaining the Iron. The market has been relieved by the disposal of Mottled, Bright and various other grades which have accumulated at the furnaces for some time. Sales probably aggregated in the neighborhood of 40,000 to 50,000 tons, including all kinds, and for delivery at present and extending throughout the remainder of the year. Car-Wheel Iron has been especially active and strong, but has not advanced, as it did not decline with other Iron some time since. Among the sales during the week may be noted about 15,000 tons of No. 2 Southern Coke Foundry Iron ranging from \$15.50 to \$16, and further sales were again made to-day at the outside rate, but holders are now asking a further advance. No. 2 ½ Foundry sold at \$15, between 3000 and 4000 tons No. 1 Southern Mill Iron sold at \$14.75, and small lots at \$14.50. No. 2 Mill Iron is scarce and nominally quotable at \$14. Between 8000 and 4000 tons Hanging Rock and Southern Car-Wheel Iron sold at \$25, cash, and further sales of Lake Superior Car-Wheel Iron were made on the basis of quotations made a week ago. Mottled Iron sold at \$18, but is now held higher. Lowmoor, Va., Iron, sold at \$16.25. For several thousand tons of Open Bright Iron about \$15.25 has been realized. The stock of Soft Iron is reported to be still large and irregular in price, but even for this kind there is a much better demand.

Hot-Blast Foundry.

Southern Coke, No. 1.....	\$16.50 @ \$17.00
Southern Coke, No. 2.....	15.50 @ 16.00
Southern Coke, No. 3.....	14.50 @ 15.00
Ohio Soft Stone Coal, No. 1.....	17.00 @ 17.50
Ohio Soft Stone Coal, No. 2.....	15.50 @ 16.00

Car-Wheel and Malleable Irons.

Southern Car-Wheel.....	20.00 @ 23.00
Hanging Rock, Cold Blast.....	22.00 @ 25.00
Lake Superior Car-Wheel and Malleable.....	20.00 @ 21.00

Manufactured Iron.—There has been no special activity in the market for Bar or Plate Iron, yet there may have been a fair number of orders and the market has ruled steady. Bar and Sheet Iron—Common Bar Iron, 1.90¢ @ 2¢; Charcoal Bar Iron, 2.90¢ @ 3¢; Sheet Iron, Boiled, Nos. 10 to 27, 2.50¢ @ 3.25¢; Sheet Iron, Charcoal, Nos. 15 to 25, 3 ¼¢ @ 4 ¼¢ ½ lb.

Nails.—There has been a little better undertone to the market, with a fair jobbing demand for all kinds. Sales of round lots are made from the mills on the basis of 15¢ lower than quotations. Jobbing prices are based upon 12d @ 40d, which sell at \$2 ½ keg, with 10¢ rebate in carload lots at mills; 50d @ 60d, 25¢; 10d, 10¢; 8d @ 9d, 25¢; 6d @ 7d, 40¢; 4d @ 5d, 60¢; 3d, \$1, and 2d \$1.50 per keg more. Steel Nails sell at \$2 and Steel Wire Nails at \$2.65 @ \$2.75 ½ keg.

Old Material.—There has been an improved demand for both Rails and Wheels, with sales of Old Rails at \$19.50 @ \$20, cash, here, and Old Wheels at \$18.50 @ \$19, but sales of the latter were made by local parties in St. Louis at \$19.50, cash, delivered from Western point.

Chattanooga.

Office of *The Iron Age*, Carter and 9th Sts., CHATTANOOGA, August 6, 1888.

Pig Iron.—The very conservative feeling that has prevailed among all the producers for the last few days is now followed by a decided stiffening up in prices all along the line. Offers for round lots, at prices that would have been taken two weeks ago, are now refused, and in some instances at least \$1 advance is asked. There has been a good deal of buying of large lots to be shipped as ordered, from which it is fair to suppose that the Iron was not for speculative purposes. There is a matter among the future possibilities which, if it should happen, will create considerable excitement in the Iron market and cause a decided upward turn in the market. Some two or three of the trunk lines leading north from the Iron producing districts of the South have declined to remain in the Southern Steamship Association, and, as it is well known that there has already been cutting in rates, it is thought by some that the time is not far off when some one of the lines will "let loose" on Pig Iron freights. Should this event take place, those who have large contracts for either furnace yard or other deliveries will, no doubt, endeavor to get the advantages of the rates.

Miscellaneous.—In the past few weeks there have been rumors of new furnace companies being organized, which are now appearing to take more definite shape, and the probability is that some 10 to 15 new plants will within the present year materialize; in fact a few of them have already gone so far as to insure their erection. A very prominent Ironmaster, who has been in the business for many years and who has always been a successful man, predicted a few days ago that within the next 10 years there would be not less than 50 new furnaces erected in the Southern States. He argues that when Ore can be put at the Tunnel Head at 75¢ @ \$1 ½ ton and a fair coking coal can be obtained within a few miles the cost of making Iron under these conditions is hard to beat.

Louisville.

LOUISVILLE, KY., August 6, 1888.

The price for all Coke Irons has advanced from 25¢ to 50¢ ½ ton, placing the West on a basis with the Eastern market, which for the last four weeks has been fully 50¢ a ton higher. There have been inquiries for round lots of Iron, and

a number of sales made in quantities of from 300 to 500 tons, though heavy purchases have not yet set in. There is a strong inquiry for deliveries running through the year and for 12 months, and it is thought that if the present tone of the market continues buyers will be generally inclined to make purchases for a year's supply. Furnaces have awakened to the fact that the market is improving, and their position is stronger than it was two weeks ago, and now are declining in many instances to sell Irons for long deliveries, but will accept orders for from 30 to 60 days. At present it is impossible to state whether there will be an advance of more than 50¢ @ 75¢ per ton, as the Western market is merely keeping pace with the Eastern, which has been rather steady for the last three or four weeks without any special advance. Rolling mills in this vicinity find the demand for Bar Iron also improved, and during the last month have made sales larger than their output, so they had to draw from stock. The car companies report improved business, and are not inclined to fight for orders as they have been during the last three or four months. Old material has slightly advanced, a very large sale of 13,000 tons of Old Rails having been reported.

New York.

Office of The Iron Age, 66 and 68 Duane street.
NEW YORK, August 8, 1888.

American Pig.—The reports of furnace agents and dealers vary considerably so far as sales are concerned. Some of them state that both inquiries and sales are heavier, and that a better feeling generally prevails. Others acknowledge that practically they have not as yet observed any marked movement, and cite instances of sales at the low figures which have been prevailing for some time. Mr. B. G. Clarke, of the Thomas Iron Company, reports that during the past week he has received inquiries aggregating 30,000 tons for Thomas Foundry and Forge Irons, 15,000 to 20,000 tons thereof being from regular customers—stove foundries, bar mills and agricultural works—who generally buy at this season of the year. It is estimated that the Thomas Iron Company have still for sale of this year's product about 60,000 tons. Ten furnaces are doing as much work and more now than 12 did a year ago, the product running up to over 15,000 gross tons per month, as compared with about 13,000 last year. We continue to quote standard to choice Northern Irons, tidewater delivery, \$18 @ \$18.50 for No. 1 Foundry; \$16.50 @ \$17.50 for No. 2 Foundry; \$15 @ \$16 for Gray Forge. Sellers of Southern Iron report but little business, some of the leading companies being sold far ahead. It is rumored that troubles in the Southern Railroad and Steamship Association may lead to an early reduction in freight rates.

Scotch Iron.—The market is very quiet, only few sales being made and those on a small scale. We quote: Coltness, \$19.50 @ \$20; Summerlee, \$19.25 @ \$19.50; Langloan, \$19 @ \$19.50; and Dalmellington, \$18.25 @ \$18.75.

Spiegeleisen.—The market is very quiet, and prices are entirely nominal at \$27 @ \$27.50 for 20 %, \$23 for 10 to 12 %, and \$39 for 45 %.

Bar Iron.—Manufacturers of special grades of iron report that the railroad companies and the locomotive shops are buying more freely, and that inquiries are growing more numerous. We continue to quote for carload lots, half extras, on dock, 1.60¢ @ 1.65¢ for Common; 1.65¢ @ 1.7¢ for Medium, and 1.75¢ @ 1.9¢ for Refined, with special qualities selling as high as 2¢ @ 2.5¢.

Plates.—With the exception of a sale of Ship Plates and of Structural material for a steamboat on a Hudson shipyard, no transactions unusual in size are reported. We continue to quote: Iron Tank, 1.9¢ @ 2¢; Shell, 2.15¢ @ 2.30¢; Steel Tank, 2.25¢ @ 2.3¢; Shell, 2.40¢ @ 2.50¢; Flange, 2.7¢ @ 2.75¢, and Fire-Box, 3.7¢ @ 4¢ in round lots on dock, American Steel exclusively. There is an active demand from jobbers for Galvanized Sheets, which we quote 65 % @ 65 & 5 % discount.

Structural Iron.—We quote: Bridge Plates, 1.9¢ @ 2¢; Universal Mill Plates, 2¢; Angles, 2¢ @ 2.2¢; Tees, 2.5¢ @ 2.7¢, and Channels and Beams, on dock, 3.3¢.

Steel Rails.—The market is exceedingly dull, no transactions of any consequence being reported by any of the leading mills. In spite of the better feeling apparently prevailing in railroad circles, the outlook is not regarded as bright, particularly for those mills in the West which depend upon the great Northwestern Railroad systems for the bulk of their orders. In the East prices remain \$29 at mill for standard sections. A meeting was held at Long Branch on the 3d inst., at which the present arrangement among the mills was continued for another year. The allotment was fixed at the same figure at which it was started a year ago, and other features of the agreement were continued, the principal changes being modifications in the percentages of the different mills. Among those present were O. W. Potter, president, and W. C. Potter, vice-president, of the North Chicago Rolling Mill Company; A. J. Leith, president, and W. R. Stirling, treasurer, of the Joliet Steel Company; J. C. Morse and Mr. Porter, of the Union Steel Company; John Walker and C. H. Odell, of the Edgar Thomson Steel Works; E. Y. Townsend, of the Cambria Iron Company; William W. Thurston and C. Linderman, of the Bethlehem Iron Company; L. S. Bent, of the Pennsylvania Steel Company; B. G. Clarke, of the Lackawanna Iron and Coal Company; Walter Scranton, Scranton Steel Company; W. Kemp and S. E. Marvin, of the Troy Steel and Iron Company, and W. Smith, of the Worcester Steel Company. The Cleveland Rolling Mill Company were represented by proxy, while Indianapolis and Springfield were not represented. The meeting was very harmonious, contrary to the expectation of some that the differences which have existed in the past would lead to some discussion.

Billets.—Importers have received a number of inquiries, chiefly in small lots and for prompt delivery, so that they have little latitude to arrange for shipments by sailing vessels. Prices of foreign material are too high to admit of much business. We quote: \$29.50 @ \$30, steamer shipment, nominally.

Wire Rods.—There are few inquiries or sales, the market remaining at \$39.75 @ \$40 for early delivery.

Axles.—Small sales only are being made in this territory on the basis of 2.15¢ for All Scrap Hammered Axles.

Fastenings.—The market is quiet, Spikes selling at \$2.05 @ \$2.10, delivered, with an additional price for any excess in

freight over 10¢. Angle Bars are 1.90¢ for Iron and 2.15¢ @ 2.20¢ for Steel.

Scrap.—Business is very quiet, there being little offering and a light demand. We hear of a lot of 150 tons of Car and Bridge Heavy Scrap offering at \$19, on barge.

Merchant Steel.—Complaints are numerous that efforts are being made by some parties in the trade to break down manufacturers' prices. The association quotations remain for 1-ton, 10-ton and 50-ton lots respectively: Tire, 2.35¢, 2.20¢, 2.15¢; Machinery, 2.40¢, 2.25¢ and 2.20¢; Toe Calk, 2.45¢, 2.30¢ and 2.25¢, and Sleigh Shoe, 2.30¢, 2.15¢ and 2.10¢; Spring Steel is quoted at 2.7¢ to consumers.

Old Rails.—We hear of two sales of 2500 tons each to an Eastern and a Western buyer at private terms. The market having gained in strength, the Western buyers are endeavoring to secure material, which is scarce. What stock there is, especially of Double Heads, is very firmly held, a considerable part of it being held on European account. We hear of offers of American Tees at \$21 on barge, which we quote.

Cotton Ties.—We are in the midst of the season and considerable business is being done. Importers quote \$1.05 @ \$1.10 per bundle of 50 pounds, delivered New Orleans or Galveston, according to time of shipment.

Bradley & Burch announce, under date of July 9, that they have begun business at Leadenhall Buildings, London, E. C., England, as Tin Plate, Iron and general metal merchants and agents. They have been appointed the London agents of John Knight & Co., of the Cookley Iron Works, Brierley Hill, Staffordshire.

We are advised by E. Bücking & Co., Walzwerk, Mulheim Rhein, that by mutual and friendly agreement Alfred Heyn has resigned as their agent, and that they have appointed Chas. G. Eckstein & Co., 32 Liberty street, New York, their representatives for the United States.

Coal Market.

The Anthracite Coal trade continues to hold a strong position, both as to prices and output, the latter being regulated by the several producing companies evidently with careful reference to the demands of consumers. During the week ending 4th inst. the production was still maintained in liberal volume, but was restricted to the extent of 70,000 tons compared with the previous week, the total being 754,883 tons, although it is still 74,000 tons in excess compared with the corresponding week last year. The decrease is about equally divided between the Lehigh and Wyoming districts. Since January 1 the production is 20,310,687, against 20,013,785 tons for the same time in 1887. Deliveries are active under engagements prior to the recent advance, but transactions based on the last circular net prices are as yet comparatively small, local dealers seeming inclined to hold off so long as the market remains as at present. It is surmised that a period of dullness may intervene after the "spurt" has subsided. Respecting tolls, &c., the Philadelphia *Ledger* says: "Some of the largest and most conservative Coal operators doubt the advisability of making any further advance in prices before October 1, and, while the Reading and one or two other carrying companies are said to be endeavoring to force an advance in tolls, others are reported to be of the opinion that the tolls are already high enough." As matters stand, production falls short of the demand for immediate shipment, especially for Eastern ports. The Philadelphia and Reading

Company for more than a week past have refused orders for shipment this month, their output up to September 1 being fully engaged. Contracts beyond that date are subject to possible changes in prices and tolls. Quotations are as follows: Wyoming Free Burning, f.o.b. at South Amboy and Weehawken, Broken or Grate, \$3.85; Egg, \$4.15; Stove and Chestnut, \$4.50; Reading Hard White Ash, Chestnut, \$4.40; Stove, \$4.50; Egg, \$4.25, and Broken, \$4.10 and scarce, but Chestnut is in better demand. The average price for Coal at the Reading mines in July was \$2.428 per ton, against \$2.319 in June. The average price of coal at five Schuylkill County collieries, drawn by lot to determine the scale of wages for July, was \$2.428, against \$2.33 in June.

Bituminous Coal has a firmer tone, and there is more inquiry. Quotations are \$3.25 @ \$3.50. Freight in New York, 75¢ @ 90¢, and discharge to Boston. The Reading Company have adopted the policy of burning only Anthracite Coal on all the passenger engines in use upon all of its Pennsylvania and New Jersey branches.

Metal Market.

Copper.—There has been little or no speculative interest in Copper either in London or here; no cable quotations came from the latter on Monday, owing to the bank holiday. On Thursday spot Chili Bars came £81. 2/6 and £81. 15/ yesterday and to-day, futures remaining unaltered, £78, while good merchantable brands, becoming more important for speculative purposes over there, advanced from £73 to £73. 10. Sales, 325 tons. Best Selected improved from £75. 10/ to £76. Here hardly anything transpired, sales being restricted to 50,000 lb, spot, at 16½¢, and 50,000 lb, November, at 16½¢, the market closing quiet, but firm to-day at above quotations. During the first 11 months of the fiscal year there were exported from the United States 22,504,785 lb of Ingot Copper, against 17,240,296 lb during the corresponding period of last year. The London *Economist* is of opinion that in trying to bring about a consolidation of the Rio Tinto, Mason & Barry, and Tharsis Copper Mining companies the French syndicate have no other aim in view than the one of facilitating the sales of the consolidated shares on the London and Paris Stock Exchanges. Meanwhile Rio Tinto shares improved in Paris 6½ francs last week. Spanish exportation of Pyrites during the first four months has been 341,009 tons, against 333,431 in 1887 and 300,562 in 1886; of Precipitate 12,026, against 11,696 and 10,660 respectively.

Tin.—The London market has been favorably influenced during the week under review by the reduced visible supply of Tin in Europe and America, which was 13,566 tons on August 1, as compared with 16,092 on July 1 and 10,528 on August 1, 1887. Spot Straits opened at £89 on Thursday of last week, and improved to £90. 2/6 yesterday, while futures rose from £89. 12/6 to £90. 10/, sales aggregating 280 tons. Although the quotations followed suit in this market, hardly any actual business was done except in a jobbing way; the tone was strong, however, at nominally 20.80¢ @ 20.50¢ on 'Change; August, 20.10¢ @ 20.30¢; September sellers at 20.40¢, and October 20½¢. This morning London is again slightly higher, spot being cabled £90. 5/ and futures £90. 15/. Our own market winds up strong, but dull, without anything transpiring in the way of sales. The import of Tin into the United States during the first 11 months of the fiscal year was 29,131,506 pounds, against 28,584,560 pounds last year, and the export 304,407 pounds, against 117,094.

According to Messrs. Giffillan, Wood & Co.'s Singapore dispatch of August 1, the July shipments from the Straits Settlements to the United States were 300 tons, against 200 in July, 1887; and to England 600, against 900. During the first seven months the Straits only shipped this way 1150 tons, against 2800 last year, but to England 10,600, against 7,500. **Tin Plates.**—The market for spot Plates remains very firm both here and in England; the future market is also higher, based on the strong statistical position and advance in prices in Pig Tin. For the present the consumption of Tin Plates is ahead of production, and so long as this state of affairs continues lower prices need not be looked for. The market closes at following quotations for large lines on the spot: Siemens-Martin Steel, Charcoal finish, \$4.85 @ \$5.25; ditto Coke finish, \$4.75; Terns, \$4.30 @ \$4.40; Bessemer Cokes, \$4.50 @ \$4.60, and Wasters, \$4.20 @ \$4.25. Coke Tins are selling at 13/3 in Liverpool, for prompt delivery. The import of Tin into the United States during the first 11 months of fiscal year has been 573,543,195 lb, against 512,251,817 last year.

Lead.—Sales were made in the open market to the extent of 1000 tons at 4.20¢ @ 4.25¢ for Common Domestic, the market closing strong at 4.25¢ @ 4.30¢. Consumers bought to a moderate extent, and the main operator has also been a buyer. From what we hear the demand for Lead manufactures has been tolerably good in July, but so far this month it is wretched once more, and in this respect the outlook for the moment is the reverse of encouraging. In London there has been no change, Soft Spanish remaining £13, and English Pig, £13. 5/. At the Metal Exchange there were sold 326 tons of Lead at hardening prices as follows: Spot at 4.20¢; August, at 4.25¢; September, at 4.25¢ @ 4.27½¢; October at 4.20¢ @ 4.30¢; St. Louis being strong and active at 4.05¢, and Chicago firm; 200 tons September lead were taken at the Metal Exchange on first call to-day at 4.30¢. The committee appointed at the Paris meeting of European lead producers for the purpose of elaborating a plan for common action to improve the position of the metal over there if possible, are Mr. Maas, for Stolberg, and for the German group, Mr. Aaron—Rothschild's manager at Paris—on behalf of the French group, and Mr. Sopwith for England and Spain. According to latest advices received it was doubtful whether a common selling office for the three groups will be created, the probability being that in this respect each group will be left to act singly. The export of Pig Lead from Spain during the first four months has been 53,934 tons, as compared with 56,051 last year, and 46,977 in 1886.

Spelter.—The better feeling in Domestic Spelter has, if anything, been strengthened still further, so that with a moderate trade doing, common brands may be quoted 4.62½¢ @ 4.65¢, and Silesiar, which rose in London from £16 to £16. 7/6, 5¢ @ 5½¢ as to brand. Spanish exportation of Calamine during the first four months has been only 11,186 tons, against 14,129 last year, and 16,522 in 1886.

Antimony.—Has been moderately active at 9½¢ Hallett, and 13½¢ @ 13½¢ Cookson. The former gave way in London from £39. 10/ to £39.

New York Metal Exchange.

The following sales are reported:

THURSDAY, August 2.	
50,000 lb Copper, spot.....	16.75¢
50 tons Lead, spot.....	4.12½¢
50 tons Lead, September.....	4.12½¢
10 tons Tin, October.....	19.70¢
10 tons Tin, October.....	19.90¢
10 tons Tin, October.....	19.85¢
25 tons Tin, prompt shipment.....	20.00¢
66 tons Lead, September.....	4.15¢

16 tons Lead, August.....	4.17½¢
48 tons Lead, September.....	4.15¢

FRIDAY, August 3.

50,000 lb Copper, November.....	16.50¢
50 tons Lead, spot.....	4.20¢
50 tons Lead, October.....	4.20¢
32 tons Lead, September.....	4.25¢

MONDAY, August 6.

96 tons Lead, August.....	4.25¢
---------------------------	-------

TUESDAY, August 7.

50,000 lb Copper, spot.....	16.75¢
50 tons Lead, September.....	4.27½¢
48 tons Lead, October.....	4.30¢

WEDNESDAY, August 8.

200 tons Lead, September.....	4.30¢
-------------------------------	-------

British Iron and Metal Markets.

[Special Cable Dispatch to The Iron Age.]
LONDON, WEDNESDAY, August 8, 1888.

The Block Tin market continues to derive considerable support from the great change in the statistical position due to enormous purchases for consumption that followed the break in the late famous "deal." Deliveries on these purchases continue to exceed the receipts from the sources of supply, and inconvenience operators who persist selling the metal "short." In fact, the purchases against such sales came directly into play as a factor in the upward turn of prices the past week. Consumers, it is said, have their present and near future wants well provided for. This fact has encouraged a belief that the future of the market hinges upon the volume of shipments from the Straits, and, as the latter are rather in excess of expectations, "short" selling has been carried on, with the results above stated.

There is no material change in the Copper market, as far at least as the syndicate is concerned. This interest continues to be a steady buyer of Chili Bars and displays no sign of being affected in any degree by the continued rapid accumulation of stocks or extensive dealings in other kinds of the metal. The visible supply in Europe, according to James Lewis & Sons' circular, is now 75,000 tons, against 71,900 tons last month and 52,000 tons a year ago. So far as can be learned, the syndicate has sold very little Copper to English consumers the past month. There is, however, more anxiety among the latter, as the supplies of old Copper are nearly exhausted, and the offerings from outside sources considerably diminished. The syndicate people have been willing buyers of furnace material, and are said to have left orders to purchase everything offered, in order that stocks may be more concentrated and consumers prevented from securing supplies except from them. Another new form of contract has been adopted, under which no less than 50 brands are a good delivery. The list includes English, American, Australian, German and Japanese makes. The Merton's are said to have taken over the Morfa Works.

The Tin Plate market remains very firm; makers are well sold ahead, and there is still a good demand for some sorts. The total stock at British shipping ports is 236,000 boxes, against 226,000 boxes July 1 and 232,000 boxes June 1. The stock a year ago was 157,000 boxes.

The Scotch "warrant" market has reacted sharply under pressure to sell for early delivery. The volume of business has been very large. More furnaces are blowing.

In the Steel Rail market there has been an active business, and makers, in many instances, are holding back for higher prices. In the other branches of the Steel trade there is little change. It is reported that Whitwells is about to lay down a new steel plant.

Scotch Pig.—Prices for makers' brands are firmly held, but business is moderate.

No. 1 Coltness, f.o.b. Glasgow	48.6
No. 1 Summerlee, " "	48.7
No. 1 Gartsherrie, " "	45.7
No. 1 Langloan, " "	46.7
No. 1 Carnbroe, " "	40.7
No. 1 Rhotts, " at Leith	45.7
No. 1 Gt. Glasgow, " Ardrossan	43.6
No. 1 Dalmeilington, " "	40.6
No. 1 Eglinton, " "	39.6
Steamer freights, Glasgow to New York	
4 @ 5/; Liverpool to New York. 6/3.	

Cleveland Pig.—Trade has been quieter and prices are not quite so firm. No. 1 Middlesboro', G.M.B., 35/6; No. 3 do., 32/9.

Bessemer Pig.—The market very steady, with a continued good demand. West Coast brands, mixed numbers, 43/6, f.o.b. shipping point.

Spiegeleisen.—Demand is quite brisk and prices are very firm. English 20¢ quoted 80/, f.o.b. N. W. England shipping point.

Steel Rails.—There is a good business at firm prices. Standard sections quoted at £3. 17/6, f.o.b. at N. W. England shipping point. Middlesboro' district 2/6 less.

Steel Blooms.—The market quiet and prices barely steady. We quote at £3. 12/6 for 7 x 7, f.o.b. at N. W. England shipping point.

Steel Billets.—Demand keeps up well, and prices are firm. Bessemer, 2½ x 2½ inch, £3. 18/3, f.o.b. at N. W. England shipping point.

Steel Slabs.—The demand moderate and prices somewhat nominal. Bessemer, £3. 17/6, f.o.b. at N. W. England shipping point.

Steel Wire Rods.—The market remains very quiet. Mild Steel No. 6 quoted at £5. 16/ and No. 5 at £5. 14/, f.o.b. at N. W. England shipping point.

Old Rails.—Business very fair and values steady. Tees quoted at £2. 15/, and Double Heads £2. 18/3, c.i.f., New York.

Scrap Iron.—A fair business at steady prices. Heavy Wrought quoted at £2. 7/6 @ £2. 10/, f.o.b.

Crop Ends.—Prices steady and the demand fair. Bessemer quoted £2. 5/ @ £2. 7/6, f.o.b.

Tin Plate.—Demand continues fairly active, and the market remains firm. We quote, f.o.b. Liverpool:

IC Charcoal, Allaway grade	14/6 @ 15/
IC Bessemer steel, Coke finish	13/ @ 13/3
IC Siemens " "	13/3 @ 13/6
IC Coke, B. V. grade	12/9 @ 13/
Charcoal Terne, Dean grade	12/9 @ 13/

Manufactured Iron.—There is a good trade at generally firm prices. We quote, f.o.b. Liverpool:

Staff. Ord. Marked Bars	£ s. d. @ 7 10 0
Common " "	4 17 6 @ 5 0 0
" Bl'k Sheet, singles	6 @ 6 15 0
Welsh Bars (f.o.b. Wales)	4 12 6 @ 4 15 0

Tin.—The market very firm. Straits quoted at £90. 5/ @ £90. 10/, spot, and £90. 10/ @ £91 for three months' futures.

Copper.—Not much doing, but the market firm. Chili Bars closed at £81. 15/ @ £81. 17/6, spot, and £78 @ £78. 5/ three months' futures. Best Selected, £75. 10/ @ £75. 15/.

Lead.—Quiet market, with prices steady. Soft Spanish, £13 @ £13. 2/6 at the close.

Spelter.—Market stronger, with demand active. Silesian, ordinary, £16. /5 @ £16. 10/ at the close.

Financial.

In the review of the week, while the general tone is cheerful and the outlook steadily improving, it can hardly be said that there is an actual gain in the volume of business in the country at large as compared with last year, the indications being to the contrary. In the New York City trade, irrespective of speculative movements, there are signs of revival. Our dry goods commission-houses report the receipt of orders for some descriptions of fall goods, and Southern merchants now arriving to replenish their stocks bring assurances of a good trade in prospect. From interior markets reports are satisfactory. The great controlling factor is the crop situation, which continues to be much more encouraging, especially with reference to the prospective European demand. Bad harvests abroad, and a promise of abundance at home, already operate to affect the course of foreign exchange. Influenced by reports of damage to crops in France and England wheat has been active and excited, with free buying on foreign account, but prices are unsettled. Breadstuffs are stronger. Refined sugar was marked down in order to break the market for raws. Spot cotton is ½¢ better.

The Stock Exchange markets were dull and irregular until Monday, with lower prices in London. On Monday afternoon Lackawanna and Reading started upward, on reports of an improved condition of the coal trade; there was good buying of the grangers on still more favorable news from the West regarding the crops; Lake Shore and the other Vanderbilts advanced, and the tone was generally strong to the close. Chicago, Burlington and Quincy operated as a damper by reporting a decrease of \$186,900 in its gross earnings and \$506,900 in its net for June, while for six months ending with June the company scores a decrease in its net of \$4,700,000. The impression seems to be growing stronger that the temporary injunction recently granted by Judge Brewer against the Iowa commissioners will soon be made perpetual.

United States bonds are quoted as follows:

U. S. 4½, 1891, registered	109½
U. S. 4½, 1891, coupon	107½
U. S. 4s, 1907, registered	127½
U. S. 4s, 1907, coupon	127½
U. S. currency 6s	120

The clearings of 38 cities last week aggregated \$912,837,265, a decrease of 12.3 % as compared with the previous year. Outside of New York the decrease was only 1.6 %. This city reported a falling of 17.5 %, Philadelphia, 9.9 %, St. Louis, 19.7 %, San Francisco, 3.2 %, Baltimore, 2.2 %, Cincinnati, 3.6 %, St. Paul, 11.8 %, Minneapolis, 11.3 %, St. Joseph, 15.6 %, Denver, 7.6 %, Wichita, 13.5 % and Norfolk, 15.6 %. Boston increased 0.7 %. Chicago, 0.5 %, Pittsburgh, 19.1 %, Kansas City, 10.8 %, Milwaukee, 24.6 %, Detroit, 24.3 %, Columbus, 25.9 %, Memphis, 15.2 %, Peoria, 20.7 %, Duluth, 31.2 % and Topeka, 39.5 %.

Respecting crop prospects the St. Paul *Pioneer News* observes: "Not for many years has the business horizon in the Northwest been as free from clouds as it is to-day. Unless all signs fail, this is to prove one of the most prosperous seasons ever known." The Kansas State Board of Agriculture has reports representing nearly every county in the State, which show that the corn crop has suffered injury, but the average of wheat and oats is higher than heretofore reported. The

Missouri State Board reports that wheat is threshing out better than expected, and will equal 72.8 of a full crop; corn, 93; oats, 88. The San Francisco *Daily News* states that the new cereal year opens propitiously. The wheat crop, though not large, is of fine quality, and will probably equal in quantity, if not exceed, that of last year. This, with a good Oregon crop and a heavy surplus stock of 6,750,000 bushels from last year, will supply cargoes for a large fleet, if the foreign market warrants its shipment. The cotton crop, according to special advises, generally promises well.

The weekly bank statement shows no essential change in cash resources. There is a decrease of \$365,800 in the surplus, due to an expansion in loans of \$2,215,000. The excess of reserve is thus reduced to \$26,747,635, as against only \$6,920,000 at the corresponding time in 1887 and \$8,647,000 in 1886, indicating an unusually strong position. Bankers are looking for a more active demand at an early date and are indisposed to make time loans, for, while rates are nominal, commercial paper is in good supply, but only the best names are in demand, as lenders are more wary since the recent failures in dry goods and other lines. We quote 60 days' prime paper 4 ¢ @ 4½ ¢; longer dates 4½ ¢ @ 6½ ¢. Rates in London have advanced, owing to withdrawals of gold from the Bank of England, and an advance in the official rate is looked for. The London *Economist*, while expecting a continued outflow of gold to South America, is also calculating upon exports of the precious metal to the United States during the autumn, the editor remarking: "There can be no doubt that both here and on the Continent the harvest promises to fall below the average, while America now seems likely to have much better crops than were anticipated." In New York the rates for sterling were again reduced on Friday, the effects of a constant movement of American securities to Europe, in addition to grain bills and cotton futures, usual at this time in the year. The imports and exports of specie at this port during the week were nominal. Since January 1 the exports are \$25,500,000, or about \$20,000,000 in excess of the imports. The purchases of United States bonds, under circular of April 17, 1888, have been as follows: Amount of 4s purchased, \$18,740,850; amount of 4½s, \$9,157,300; total, \$27,898,150. Cost—4s, \$23,801,408.46; cost of 4½s, \$9,859,637.20; total, \$33,661,045.66. The net decrease in the debt, less cash in the Treasury, during the month of July, was \$4,137,000.

The importations of merchandise at this port during the week were much reduced, the valuation being \$8,164,000, of which \$2,850,000 represents dry goods. Since January 1 the total is \$284,578,000, against \$281,560,000 for the same time last year and \$259,300,000 in 1886.

Although railroad foreclosure sales have been only 12 in number during the first half of last year, the *Railway Age* concludes that this favorable showing is more than offset by the fact that receiverships have been announced in more cases and upon roads of greater capital and mileage during the six months than during the entire year preceding.

The San Francisco *Bulletin* thinks that as that city's ability to build first-class iron ships, as was shown in the manufacture of the Charleston for the Government, has been demonstrated, the city may hereafter build vessels for the Governments of China, Japan, Argentine Republic, Chili, Brazil, Central American countries, Mexico and Peru, instead of England and other European countries, because that town is nearer home.

Imports.

The imports of Iron and Steel, Hardware, &c., at this port from July 21 to August 4, inclusive, and from January 1 to August 4, inclusive, were as follows:

Iron and Steel.

	July 2 to Aug. 4. Tons.	Jan. 1 to Aug. 4. Tons.

Detroit.

WILLIAM F. JARVIS & Co., under date of August 6, report as follows: It is with pleasure we have again to report a strong market, and one which seems to be gaining strength daily. It is now affecting material of all kinds. A straight advance of from 50¢ to \$1 1/2 per ton can be noted upon Southern Irons, the larger advance being on Mill grades. Lake freights have advanced materially, causing a corresponding advance among the makers of Pig in the Mahoning and Shenango valleys. Also to lower Lake Superior charcoal furnaces, who, in addition to the advance to be obtained for increased cost, are in the healthy condition of being largely sold ahead, and continued demands upon their stocks are to be noted. Old Wheels are becoming a scarce article again, and prices look toward an advance in that direction. While the buying which is being done at this time is more or less to be considered as periodical and of a magnitude that will not continue, the calls this year are so largely in

excess of what they have been during similar periods of other years that it cannot fail to affect the price. We quote the market firm as below:

Lake Superior Charcoal, all num-bers.....	\$20.00 @ \$20.50
Lake Superior Coke, all ore.....	19.25 @ 19.75
Lake Superior Coke, cinder mixed.....	19.00 @ 18.50
Standard Ohio Black Band.....	19.25 @ 19.75
Southern No. 2.....	17.75 @ 18.25
Southern Gray Forge.....	15.75 @ 16.25
Southern Silvery.....	17.00 @ 17.50
Jackson County (Ohio) Silvery.....	18.50 @ 19.00
Old Wheels.....	19.00 @ 19.75

Burnishing Iron and Steel by Electricity.—The following method for burnishing iron and steel by means of the electric current was communicated by A. de Meritens at a meeting of the International Electric Society in Paris. The layer of oxide on the surface of the metal is obtained by placing the same as anode in a bath of common or distilled water. The sides of the vessel holding the liquid, or a piece of iron, copper or carbon, are used as cathode. The temperature of the water is kept at 160° to 175° F. The electromotive force must be just strong enough to decompose the water, as a current which is too strong gives a dusty layer which is not permanent. Under the action of the oxygen liberating at the anode, a layer of a black oxide (Fe₃O₄) forms on the metal. This layer can be easily polished, steel giving the best results, while on cast and rod iron a more dusty layer is obtained, though the use of distilled water makes the polish permanent.

A Dusseldorf letter speaks of the principal manufacturers of cutlery in Germany. The largest tool factories in the world are found in Remscheid. Solingen, the German Sheffield, Damascus and Toledo combined, is another town situated in the district of Dusseldorf. The entire population of this town, and of the vicinity, is occupied in the manufacture of cutlery. Every conceivable article used as an instrument to cut is made here. The German Government employs thousands of men here every day to manufacture her weapons; the sugar planter of the South gets his large knives from here, which serve him for cutting sugar cane; the Esquimaux knife is made here for slicing the sea lion and the whale; the erasing knife of the patient editor, the dissecting instrument of the surgeon and the harmless tool which the domestic uses for peeling the potatoes, as well as the article which is often vainly tried for cutting a broiled steak in a cheap restaurant—all these are made in Solingen. In Radevormwald, containing 10,000 inhabitants, everybody is engaged in the manufacture of locks, keys, files, hammers, tongs, &c.

In a paper on the composition of water by volume, by Mr. A. Scott—"Proceedings" of the British Royal Society—the ratio by volume in which oxygen and hydrogen combine at 0° and 760 mm. is redetermined. The apparatus used is so arranged that both gases are measured in the same vessel, a separate vessel being used for exploding. After explosion the residue was analyzed by exploding with oxygen or hydrogen and the impurity—nitrogen and carbonic anhydride—determined. The oxygen was obtained from potassic chlorate and from mercuric oxide prepared from the nitrate; the hydrogen was obtained by electrolysis. The ratio obtained is 1.994 : 1, which, with 15.9627 for the density of oxygen, gives 16.01 as the atomic weight of oxygen.

The American ambulance system has been formally adopted in Paris, with the sanction of the French Government.

Hardware.

The volume of business has been moderate during the week, without any very noticeable feature. Travelers are sending in a fair number of orders, but they are generally small in amount, buyers seeming to feel far from sure of the solidity of prices. Manufacturers, on their part, exhibit more firmness than has been the case for some time, and are improving in the art of saying "no" when orders are offered at cut prices.

Cut Nails.

After the dullness of the past month, there is a somewhat better movement in Cut Nails, and it is observed that the proportion of Steel Nails called for is growing. Inquiries are running toward heavier lots, but prices remain unsatisfactory, concessions from \$1.90 on dock for carload lots being made with some frequency.

E. G. Scovill, of St. John, New Brunswick, has issued a circular, from which we quote as under: "Your attention is called to the large amount of money which can be made by manufacturing Cut Nails and Bar Iron under the present Canadian tariff. As a paying investment there is nothing to equal it in the history of the American Iron trade. Cut Nails are worth, wholesale, in Canadian market, \$2.60 per keg of 100 pounds for 10d., and upwards, other sizes in proportion; or 55 cents a keg more than in the Boston market, while Scrap Iron can be landed here at \$4.82 per ton less than in the United States, this amount being the difference saved between United States duty on Scrap Iron of \$6.82 per ton and Canadian duty of \$2 per ton, viz.:

	Per ton.
55 cents a keg more than in Boston market, wholesale.....	\$11.00
Saved on Scrap Iron.....	4.82
Total.....	\$15.82

amount to credit of manufacturing here over and above Boston wholesale prices, which leaves the manufacturer a good profit. The demand for Bar Iron is large and increasing and the profit of manufacturing is much larger than in the United States. Suitable coals from Nova Scotia can be laid down at proposed works at \$2.65 per ton. Within six months we will have the Short Line Railway open, placing us within 16 hours of Montreal, which will also open that market to this company, as finished goods can be taken to Montreal and other western points at a much less proportionate rate of freight than the manufacturers there pay upon our coal, which they must have. I intend forming a company with a capital of \$200,000, in 2000 shares of \$100 each, organized under the laws of New Brunswick. This company will pay a yearly dividend of 20 per cent. on its paid-up capital, at present prices."

Barb Wire.

The apathy of the past month shows a few signs of being dispelled, but what movement there is still confined almost exclusively to small lots, carload orders being scarce, so that the quotation of 4 cents in this market is entirely nominal. Reports from the West indicate very sharp competition for business there, with low prices prevailing. It is believed that the financial necessities of some of the mills force them to market their product. To some extent the demoralization is due, however, to the low prices made on Plain Wire for Barbing. Reports from the South point to a better demand from that quarter. The export trade is dull.

Cordage continues feverish and advancing on account of the Manila Hemp market, which is exceedingly strong both here and in London, and Sisal is kept up by sympathy. The demand is large, stock small, and manufacturers are behind in their orders. We quote as manufacturers' prices, subject to 1½ per cent. discount for cash in ten days:

Manila, ½ inch and larger.....	11½ cents per lb
Manila, ¾ inch.....	12 " "
Manila, 1 and 5-16 inch.....	12½ " "
Manila Tarred Rope.....	11 " "
Manila Hay Rope.....	11½ " "
Sisal, ½ inch and larger.....	9½ " "
Sisal, ¾ inch.....	9¾ " "
Sisal, 1 and 5-16 inch.....	10½ " "
Sisal Hay Rope.....	9½ " "
Sisal Tarred Rope.....	8¾ " "
Sisal Medium Lath Yarn.....	8½ " "

Henry Schade, who is well known as a manufacturer of Silver-Plated Ware, 56 and 58 Ainslie street, Brooklyn, E. D., N. Y., is manufacturing the Brooklyn Latch, of which he is sending out a colored lithograph for distribution among his customers. The discount on the Latch is 40 and 10 per cent.

L. & I. J. White, Buffalo, N. Y., have just issued a new catalogue and price list of their Coopers', Carpenters', Ship, Butchers' and Ice Tools, Machine Knives and other specialties, in a neat and tasteful pamphlet of about 12 more pages than their previous issue. This additional space is taken up by the new articles which they have added to their line, which is yearly becoming more complete. They say that during the year they have greatly enlarged their works, and are now prepared to fill orders with dispatch.

The fall circular of McIntosh, Huntington & Co., Cleveland, Ohio, is before us, giving price lists and illustrations of a line of seasonable goods.

An incorporated company has been formed under the name of W. K. Morison & Co., to carry on the retail Hardware business at Minneapolis, Minn. The capital is to be \$100,000, payable as may be ordered by the directors. The indebtedness of the corporation is limited to \$40,000. W. K. Morison is president and J. Louis Pendleton secretary and treasurer.

The Adams & Westlake Company, Chicago, put upon the market a short time since an iron half-bushel Measure, which has met with much favor. The body is made of heavy sheet iron, but the bottom is of wood, and a wooden hoop is fastened round the top to stiffen it and enable it to be grasped anywhere without shifting position. The sides flare sufficiently to nest, so that the Measures can be packed in racks of one dozen without taking up much space either in shipping or storage. They are japanned in assorted colors.

G. Getty Stuart, late with Clement M. Biddle & Co., of Philadelphia, and F. W. McLean, recently connected with the Biddle Purchasing Agency as its representative in Pittsburgh, have formed a co-partnership under the style of Stuart & McLean as brokers and commission merchants in Iron, Steel, General Hardware and Railway Supplies. The headquarters of the new firm are in the Hamilton Building, Pittsburgh, Pa., where they will be glad to see their friends and the trade generally.

Hibbard, Spencer, Bartlett & Co., of Chicago, have added a new department to their already extensive operations. They have laid in a full line of Rochester Lamps and are now ready to supply the trade in any quantity. Their stock embraces all grades of Fount and Stand Lamps, Hanging Lamps, Parlor Lamps, Piano Lamps, and all the various trimmings and paraphernalia. The demand for Lamps is steadily increas-

ing in cities as well as in the rural districts, and this enterprising firm intend to have a share of the expanding trade in them. Their stock will embrace the most artistic styles as well as the ordinary grades, so that a buyer can select a complete line. A catalogue is now in preparation and will shortly be issued, showing the various kinds and styles. Hibbard, Spencer, Bartlett & Co. also state that the demand for Political Campaign Goods has set in unusually early. They have already sold as many of these goods as they did in the entire campaign four years since. They are increasing their stock in this line and expect soon to have the largest assortment in the country, comprising everything required for an outfit, from a piece of wick up to a suit of clothes. They have in preparation a catalogue of Campaign Goods which will soon be ready for distribution.

The Enterprise Mfg. Company are now prepared to make Mills to grind Coffee, Pepper and other spices very fine, a thing for which there has long been a certain amount of inquiry.

The Phoenix Caster Company, Indianapolis, Ind., have begun suit against James H. Cutter and Rufus L. Woodrough, for infringement on patent on their Casters.

The Hartman Mfg. Company, of Beaver Falls, Pa., manufacturers of patent steel picket fence and diamond fencing, will soon commence operations in the new works, which are just about completed, at the above place. The company are already in receipt of a large number of orders for their goods, sufficient to keep them busy for some months.

J. E. Emerson, the well-known saw manufacturer, and Thomas Midgley, Beaver Falls, Pa., have purchased 20 acres of land adjoining the Fort Wayne Railroad, and are about commencing the erection of buildings for the manufacture of their patent wire belting and hose. They have had the belting in use a sufficient length of time to test its practicability, but it will be some months before they will be in a position to put any on the market. This belting is covered by a number of patents. The buildings will consist of one brick building, 60 x 40, one story, and a one-story frame building, 50 x 30. The brick building will be used for the furnaces and the frame building for weaving machines.

The Reading Hardware Company are now running the Manhattan plant and all departments of their old works which were not destroyed by fire, and are now prepared to accept orders for, and to furnish promptly, a very large proportion of their line, including their popular Geneva Hardware.

The Columbiana Pump and Machine Company, Columbiana, Ohio, write, under date of July 24, as follows: "We have lately added some new machinery and increased our facilities and are turning out work equal to any made. Have just completed arrangements with the Kansas City Pump Company, of Kansas City, Mo., to represent us in that city, and will ship them a large quantity of our goods within ten days."

Isaac P. Madden, of the Madden & Cockayne File Works, of Middletown, N. Y., and secretary and treasurer of the Middletown and Crawford Railroad Company, died on Tuesday of apoplexy. He was 52 years of age. Mr. Madden has been a prominent member of the Board of Education of Middletown for many years, and was universally respected as a man of unblemished personal and business character.

Standard Price List of Emery Wheels.

August 1, 1888.

We give above the standard price list for Emery Wheels which has been adopted by the Emery Wheel Manufacturers' Association, to go into effect August 1. A careful examination of this list will show that the association have been revising the old price lists, correcting discrepancies, &c. The uniform list thus adopted, as well as the uniform lists for Cup Wheels and Cylinders and Emery Bricks, will be appreciated by the trade, and will doubtless serve their convenience.

The following schedule of prices for special Emery Wheels has also been adopted by the association:

Cone Wheels are to be listed at their full thickness, and their average diameter.

Dish Wheels are to be listed at their full diameter, and greatest thickness.

Pot Balls to be listed at their greatest diameter, and two-thirds of their thickness.

Cylinder Wheels are to be listed at 1 cent per cubic inch more than regular wheels, and the printed price list is figured on this basis.

Cup or Tub Wheels are to be listed the same as Cylinder Wheels, with the price of the inside diameter of Cylinder and thickness of required bottom added at the price of regular Wheels, and intermediate sizes of Cylinders and Cup Wheels in diameter and thickness of rim be listed at next larger size.

Wheels with holes less than 6 inches, same list as for solid wheels, and 6 inches and over deduct for a wheel the same size of the hole, but at one-half the list price only.

Wheels 1 inch in diameter and $\frac{1}{4}$ inch thick shall be listed at 30 cents each, and 5 cents for each $\frac{1}{4}$ inch thickness, and in lots of 100 or more may be sold at a net price of \$10 per hundred.

All intermediate sizes on regular wheel list shall be listed in direct proportion to their diameter by inches.

The matter of discount is not determined by the association, but is left to the different manufacturers.

Plows.

The Northwestern Plow Manufacturers Association will cease to exist after the 14th inst., and the members will thenceforth act independently. It is asserted that unless the demand improves most unexpectedly the price of Plows will decline to a point that will force many manufacturers to suspend production, their united capacity being greatly in excess of the

nominal consumption. It was hoped by those who were prominent in organizing the association that relief from excessive competition could be secured through it, but they were not able to induce all the manufacturers to unite with them. Those who remained outside reaped the benefits of the association without bearing any of its burdens, and in time this became too apparent to be endured any longer. All will now be placed on an even footing, and it is expected that weak establishments will find themselves forced to succumb to the inevitable. The old question of "the survival of the fittest" will evidently be worked out in this branch of trade as it has in some others.

Razor Straps.

The Alford & Berkele Company, 77 Chambers street, New York, have heretofore been agents for the goods made by B. F. Badger, Jr., but, as he has given up business and gone back to his father, "the original, genuine and only" Badger, manufacturer of Badger's & Emerson's Genuine Razor Straps, they have taken the agency for the latter goods. The following new list is now issued, with the uniform discount of 25 per cent., 60 days, or 2 per cent. for cash in 10 days, f.o.b New York or factory.

Benj. F. Badger's Razor Straps.

Mr. Badger claims to be the introducer of the "Tension" Strap to the American market, under the name of German Belt.

Stove Polish.

Yates & Co., Rockford, Ill., issue under date of August 1 a reduced price list on Stove Polish. They inform us that their trade the past season has been very satisfactory. They have established several new agencies, and now their goods are obtainable in all the principal cities. Following is the list just adopted:

Superior Liquid Stove Polish.

2-gallon cans, per gallon.....	\$0.80
3-gallon cans, per gallon.....	.70
5-gallon cans, per gallon.....	.60
10-gallon cans, per gallon.....	.50
$\frac{1}{4}$ -pint bottles, per dozen.....	1.20
$\frac{1}{2}$ -pint bottles, $\frac{1}{4}$ gross lots, per dozen.....	1.10
$\frac{1}{2}$ -pint bottles, 1 gross lots, per dozen.....	1.00

Nonpartel Stove Varnish.

5-gallon cans, per gallon.....	\$0.40
--------------------------------	--------

Rust Proof.

2-gallon cans, per gallon.....	\$0.80
3-gallon cans, per gallon.....	.70
5-gallon cans, per gallon.....	.60
10-gallon cans, per gallon.....	.50

Standard Paste Stove Polish.

10-pound, per pound.....	\$0.12 $\frac{1}{2}$
50-pound, per pound.....	.10

Brightline (Nickel Polish).

3-ounce bottles, per dozen.....	\$1.20
---------------------------------	--------

Prepared Stove Putty.

10-pound cans, per pound.....	\$0.10
50-pound cans, per pound.....	.08

Indestructible Fire-Proof Stove Lining.

50-pound bags, per bag.....	\$0.75
100-pound boxes, per box.....	1.50
400-pound barrels, per pound.....	.01 $\frac{1}{4}$

Pure Ceylon Lead, Very Finely Ground.

5, 10 and 25-pound boxes, per pound.....	\$0.10
--	--------

Trade Topics.

From A. M. Smith, Pike, N. Y., we have the following practical suggestions with reference to the successful conduct of business. His remarks are prefaced by a reference to the fact that most of the articles which we have published relate to large stores, and that for that reason, perhaps, suggestions in regard to business conducted on a smaller scale may be in order. But it will be seen that in the following communication points are made which are applicable to large as well as small establishments:

No man can succeed in business without neatness and order, without counting, weighing, measuring and marking with the cost and selling price the goods when they come into his store. Nothing is more

damaging to a salesman than to be saying after he has named a price, if the purchaser thinks it too high, he will look up the bill and see what it cost. Such a man will not know what he has in his store, nor how much he is overcharged on his bills, nor whether he gets all the goods his bills call for. He may be pleasant and sociable and happy in the very midst of eternal chaos, but fate will be his enemy, and he will finally sleep in a poor man's grave. Such a man or such a clerk will continue to squander time until finally he is sold out by his creditors, and if he falls back upon a farm he will be just as unthrifty. His buildings will go to ruin and his crops will not be gathered in season. A merchant must be alive six days in the week, letting nothing escape his notice. Eternal vigilance is not more the price of liberty than an ability to attend to small details in succession is the price of commercial success. I know good men who may be in their office late at night or dancing on the floor as salesmen after other dealers have closed up, who always find the place in perfect order. Every morning and during the interim their eyes have been carefully over all from cellar to garret, noticing every pipe, flue, chimney, tank and barrel most critically, to see that nothing is in danger of running to waste.

In the next place I would never under any possible circumstances have a fiddle or a checker-board in the store. They are supreme nuisances. A salesman can wait upon a customer, and then if not employed at once go and attend to some other matter—make out a man's account, mark some goods, replace some goods taken down, pick up something dropped on the floor, go to work arranging things in showcase or show-window, or filling some boxes with Bolts which he has found empty, and thus command the confidence of his employer. His services will always be in demand, because he is so useful that his services are invaluable. On the other hand, if a clerk is born blind in the way of business and can see nothing not called several times to his notice, who is forever fussing about with some boy on a 2-cent trade, who has confidence in everybody and is ever ready to lend new goods or his employer's money without orders, who can spend half a day waiting upon half a dozen customers and get no time to sweep the store or fill a lamp, who is in a mental daze or semi-conscious state, or watching some point in vacancy instead of being as busy as a bee, knowing what to do and systematically attending to his duties—that young man is a fraud and a failure, and will not be likely to ever own a shop or store.

A Boston hardware dealer writes on show windows as follows: "There is hardly any end to the changes that can be made in the show-windows of a hardware store. By taking some chain it is easy to write words, letting the chain pass through the hand, and a nice border can be made in the same way. By using brass and iron chain many fine effects can be produced. Papers of carpet tacks can be arranged to spell the words

CARPET TACKS.

Large spikes can be arranged to say "NAILS." As a foundation for this kind of a display, silk velvet looks well, but it is rather expensive. Paper is cheaper, and can be had in most any color. It would not be a bad plan to set a nice parlor stove in the window, and have the decoration on the bottom of the window done with old-fashioned rag-carpet, and then have lace curtains made from common ticking, which the boys in the shop could use for aprons after the novelty wore off. The merchant who is too lazy to think up something new for his show-

window may become quite aged before he lives in a house that has a mansard roof. A word to the wise, &c."

Arrangement of Stores.

From F. E. Mole & Co., Adams, Mass., we have, in reply to an inquiry from the trade, which appeared in these columns, information in regard to their method of accommodating Belting, their rack for this purpose being shown in the accompanying illustration, Fig. 257. In this rack each space is made to hold 250-foot rolls, with the exception of the larger sizes, say from 5 inches up. The depth of the rack is 2 feet, and it is so constructed that the bottoms of the different partitions slope back about an inch to the foot. It is referred to as inexpensive and as economizing labor in handling Belting. Our correspondents suggest that it could further be improved by running iron rods

Fig. 257.—Belting Rack.

across the front about 6 inches above the floors on which the Belting rests. This is suggested for the purpose of preventing the Belting from rolling out when measuring. The rack is 4 feet 8 inches wide and 5 feet 1 inch high.

The following suggestions in regard to the arrangement of Hardware stores are given by English merchants and taken from the London *Ironmonger*, a paper which from time to time has given more or less attention to this subject:

As most articles in our trade, being Iron, are of a dark and somber hue, it is most necessary that we should allow as much light into our shops as possible, and it will make a marked difference in their appearance by, to use an expression, "forcing light" into the darker corners, or any part where the light is not good by placing there articles that are of a bright or light color. A showcase should never stand on the floor, in my opinion, as it can be seen better when raised, and also affords a convenient space underneath for showing stock that does not require to be in a case but yet wants a prominent position. If a case is in a bad light, cover the back and top inside with white paper. In like manner face the Brassfoundry. Also, in arranging goods about the shop, place the brightest-colored articles in the poor light and darker ones in the best light. For instance, in showing two sets of Toilet-ware, one may be black and gold and the other light green. Place the former in the best light to show it up, and the latter where the light may not be so good, and it will show up in contrast to the darkness behind it. The same principle will prove good in window-dressing; if the window is dark at the back paper it with white paper, place the lightest-colored articles at the back, and the dark ones will show of themselves in the front. I should also recommend white paper, in the absence of glass shelves, for setting off Electroplate. I might mention that in arranging goods on stands or anywhere for show, always place them with system and regularity, and the same class of goods as much together as possible. In dressing cases the great secret is to make a center, or, if large enough, two centers, of some special articles, and arrange from them to the sides.

The front of the counter should never open except from the back, as it always annoys customers to have to disturb them to get a Tea-Tray out, or, if there are cupboards, to get

whatever stock may be kept there. A few articles hanging loose and a few Bordered Mats make a good show, or a glass case in which goods are shown that need not be got out at the time. A satisfactory arrangement is often made by having a glass partition inclosing the window and dividing off the shop, making a miniature showroom with its front to the street.

On the counter should be a few novelties, or handy, easily-taken-up articles, frequently changed, or a flat glass case for Cutlery, kept tidy; on no account should any desk be fixed to the counter, particularly at the window end; a free passage should be left between the counter and the window inclosure for the assistant to pass through and open the door for the customer's exit. The order and cash books can be kept on a shelf under the counter, and used on the counter for taking customers' instructions. The master's desk should be at the far end or in the middle of the shop. It is objectionable if the master is close within earshot of a customer, as it does not always suit him to attend, yet he appears neglectful if he does not speak; at a distance a bow is often sufficient recognition, and he can then go on with his work, or converse more privately with a traveler. Travelers do not mind how far they have to go into the shop if there is a chance of an order, but customers, particularly strangers, are very chary of going far in; to some extent they think they are trespassers on private premises, and the more so if merely asking the price, or for something they are not very sure about having come to the right shop for.

Glass cases are not so absolutely necessary in an ironmonger's shop. I favor articles in paper to a greater extent than is perhaps usual; glass cases are often only an excuse for laziness. Tin goods are best papered up, as they soon lose their brightness if exposed to the light. Cleanliness is most important, and, owing to the long time goods stand on the shelves without being required, it is often hard to keep up to the mark in that respect.

Circulars on the counter are a mistake, particularly when in untidy heaps. Some makers who print ironmongers' names on circulars at a low rate or free of charge are generally favored by having the whole bundle placed on the counter, where they remain until dirty or useless. They should be placed in neat holders, a few at a time, and renewed fresh and clean; the bulk should be distributed as soon as they arrive, by post or messenger, as then they do more good to both maker and ironmonger.

As regards window dressing I find it necessary and very advantageous to have frequent changes, and also to mark some of the regular going things, especially Cutlery, in plain figures; not to mark all, but a parcel or article here and there, so as to give an idea of the prices. There is one evil in changing the exhibition of stock in windows which ought not to be overlooked, and that is, the tendency of assistants to be so anxious to put in the new or fresh exhibit as to pay little attention to what becomes of what is removed from the window.

I have recently altered a small room on the ground floor, which was formerly little else but a gloomy dungeon, and stocked with Register and Sham Register Grates, mixed up anyhow, into a very nice little show-room; papered the walls nicely, and covered the floor with linoleum, and introduced light, and fitted it up with shelves draped from top to bottom with red glazed cloth, and on the shelves I have samples, either one, two, or three, as room will permit, of everything in stock likely to be wanted by a housekeeper, and it is surprising the wonderful convenience and profit in it in various ways. Without saying more on this point I will give an instance of results. A lady called and wanted a Stewpan. I knew there were samples in this room, so took her in. The right size was not there, so I asked her to take a seat while I fetched it. By the time I returned she had selected seven other articles from the shelves, which, as she said, she would never have thought of had she not seen them, and expressed herself pleased with the arrangement; in fact, had no idea I kept such things in stock. And in regard to this room, when any article is sold it is at once replaced, and thus we find out when stock is running low. Before entering this small sample show-room customers have to pass through a larger show-room, in which are exhibited large goods, such as Hip and Sponge Baths, Trays, Cutlery in glass cases, Lamps, Mowing Machines, &c.

Another good arrangement is the Nail room, where everything we profess to keep in the shape of a Nail, from the smallest Gimp-Pin to a 7-inch Spike, is, or ought to be, found, the bulk of the stock being kept in a cellar.

Louisville Trade Items.

We have the following from Louisville under date of the 4th inst.

The Hardware trade of this week is about on an average of last, except in some lines of heavy goods, where it eclipses all previous

weeks. The shipments of one house alone have run up to as much as 17 heavy two-horse wagon loads per day, and in this city two horses haul as much as three or four in other places on account of our excellent streets of granite block. One other house averages a daily tonnage of 100 tons each way, in and out. Most of the jobbers report trade very heavy, quite equal to the corresponding time of last year, which was the heaviest in the business for many years. Large stocks are constantly coming in, the purchase of which seems to be warranted by the excellent prospects of the growing crops of corn and tobacco of this region and the cotton in the lower States, where the best territory lies, supplemented by the large inflow of wheat now being marketed.

A great deal of Barb Wire is going out, together with all the other Hardware belonging to the country, and also builders' wares for finishing, such as Doors, Blinds, Sashes, Sash Weights, Hinges, Locks, &c., are moving briskly. There is beginning to be a scarcity of Bar Iron, caused by the suspension of the mills in July, and frequent inquiries for common Sheet are made, especially since the assignment of the Aurora Iron Works, of Aurora, Ind. They had large contracts in this city and adjacent territory, and now some of their customers are in a predicament, and are anxiously, but very quietly, feeling the market. And yet they are in doubt whether to contract for large lots, because the Aurora Mill may come round and partly fill orders, for which they were booked full, up to December, at very low prices. In Nails the cut rate freight mentioned last week was withdrawn, and now river freights from Pittsburgh and Wheeling are cut off, but on the top of this comes a general confidential shade in price made by some of the lower mills.

The new National Nail card has not served its purpose in preventing the list of extras being interfered with, as there are flagrant abuses by the regular mills, both on 10d. and fine Nails, and the Tack factories are still using their fine Nail machines to some purpose, and probably their inroads are what is causing such disorder among the regular mills. It is time to stop the present state of affairs, as the buyers are entirely demoralized, and the mills none the less so, but what is to cause a cessation is the great question.

Taken as a whole, the week has been a good one for the jobbers; satisfactory shipments have gone out, and they feel sure of getting full returns for the goods. F. F. GILMORE.

His Last Trip.

Wm. H. Maher, Toledo, Ohio, author of "A Man of Samples," contributes the following characteristic sketch:

Among the men who called regularly upon us for the past 20 years there was none for whom we had a warmer welcome than for Sam Parmelee. Good-natured, serene, thankful for an order, not cast down if he failed to get one; always saying amiable things of the other boys, and rarely staying as long as we wished. He had a fatherly interest in such youngsters as Chris. Morgan, Henry Hall and Tibballs. If they had secured the order for britanna spoons that he wanted, he good-humoredly promised to make it hot for them the next time, but always ended with a pleasant word for each and all.

When his concern secured a genuine "Rogers," Sam was fairly bubbling over with joy. He had been long enough with Tibballs & Munson to have learned by heart all there was to say about that talismanic silver-plated label, Rogers, and he beamed on you with unutterable happiness at being, at last, able to offer you Rogers's goods. What buyer does not remember his benignant "Personal Guarantee;" his confidential extra 5 per cent., and his surprise to find that Munson was doing a little better than that? Are not all these written down in the buyers' memories?

Late last fall, well toward December, if not in that month, the portly figure and well-known swinging gait of my old friend proclaimed his identity long before he reached me, but when we were shaking hands I saw his face was unusually happy. I was full of plated ware, so that our talk did not linger long over that, and I asked him why he looked so happy.

"It's my last trip," said he. "I've been on the road just 20 years."

"Is it that long?" I asked. I remembered his first appearance well, and I am beginning to think that 20 years roll by altogether too fast.

"Yes," said he, "just 20 years of it, and now I am going to quit the road. There are a lot of pleasant men in the trade, and I guess I have had about as easy a time as any man could have, but you can't imagine how glad I am to stop traveling."

"What in the world will you do?"

"Do? Why I have one of the nicest farms in the State of Connecticut, and I am going to have the best time on it any man ever had in this world. I want you to promise to stop off at Wallingford and visit me. If I don't give you a high old time then I'm mistaken."

"So you are not only going off the road but are going on a farm."

"Yes, sir! I am. There is no State in this world quite so nice as old Connecticut, and no place in that State equal to my farm. You just come and see it, and you will say so, too. I anticipate a great deal of pleasure in seeing some of my old friends in my own house."

"But you are not going to work."

"Oh," said he, laughing all over, "I'm going to work if I want to. After a man has traveled 20 years he is ready to do most anything for the privilege of staying at home and sleeping in his own bed. Lots of the men who were on the road when I began have gone to sleep in their graves. I began to feel as if that would be my fate if I didn't hurry, but now I've got it all fixed, and I'm there."

"So we won't see you as a drummer any more?"

"No, sir! this is my farewell tour. There have been a good many ups and downs in trade since I began; a good many business booms, and just as many periods when it was hard to give goods away. But since our folks got Rogers it has made him —"

"Oh, bother Rogers! let him go, this is your last trip, so you can afford to stick to facts."

"Why the fact is," and his honest old soul looked amazed that his 'facts' should be doubted, "its just as I say."

"Well, let it go; don't be a crank on Rogers any longer; let them continue to turn their own crank; when do you get through?"

"With the year. I shall be home in a week and will get out of harness by December 31. Then I'm going to fix up my place, and live as comfortable as an old horse in a clover lot. You'll come and see me, wont you? I shall get hold of Morgan and Hall every chance I have and make them tell me all about every man they saw. I expect there will be times when I'll be awful homesick for a grip sack and an order book, but I don't intend to have any more of it."

As we shook hands he added other invitations, and I accepted them all; when he repeated for the seventh time, as if it was the one joyful thought in his heart, "I shall just settle down and enjoy myself for the rest of my life."

I believe I was almost as glad for him as he seemed to be for himself. After he went out I sat there thinking of the changes 20 years had wrought, and many faces came before me of the men who had called on us, as Sam had, during that time. So very many of them were dead. Some of them, not many, were worse than dead; many of them were stay-at-homes now, in store or factory, seen occasionally, and always with pleasure, and many were still on the road. Not one of them deserved better of the world than did Sam, and as I turned to my work I said to myself, "I don't believe he leaves an enemy or a man with unfriendly feelings anywhere on his route."

By-and-by the other "boys" came around and had their jokes over Sam's "farewell appearance," every one of them sure that he deserved a happy old age, and that Fortune was sending her favors this time to the right person. During the holidays I had frequent occasion to go among the plated-ware stock; every time I saw the goods Sam came before me and his happy face at the good times within his reach. I was reminded of him again and again, for he was so well known many traveling men spoke of him.

I passed through Wallingford early in the year. It was a dreadfully unpleasant day, high winds and rains, and I smiled to myself as I thought of Sam watering his stock and having a good time. I looked the few men in the depot over carefully to see if perchance he might be among them. He was not there. He was, in my mind, in New York, and the first time I ran across a Wallingford man I said, with a laugh:

"I suppose Father Parmelee is taking solid comfort on that handsome farm of his. I hope the good soul will get all the comfort out of it he looks for."

"Why," said my friend, "haven't you heard? Sam was found dead in bed—died of heart disease. They buried him only yesterday."

Water Meters.

We are indebted to Mr. John C. Kelly, president of the National Meter Company, 252 Broadway, New York, for a valuable book entitled, "Statistics, Tables and Water Rates of Cities and Towns," together with facts about water meters, compiled by the company of which he is president. The book is some 7 x 11 inches in size, well bound in cloth, and contains over 80 pages. In the introductory statement the publishers announce that, having frequently received inquiries from many of their correspondents for lists of water rates charged in various towns and cities, and for other information with reference to water supply in the use of meters, they have prepared a list and statement, made up from the most reliable data they were able to procure, and published them in this book, hoping they will prove interesting and useful to all who are concerned in the important question of water supply. They also state that they have introduced evidence establishing beyond question the utility and equity of the meter system, and refer briefly to the many advantages that come from using meters. The first 20 pages are devoted to cuts with descriptive text of the various styles of meters which they manufacture. Tabular statements and testimonials follow, after which come the four tables mentioned in the preface. These tables are printed on large sheets of paper, giving full lists of the water rates of all the large cities of the country. As reference tables, they will prove not only interesting, but exceedingly valuable to many people. The remainder of the pamphlet contains extracts of reports, statistical tables and miscellaneous information from various sources, the last thing to be noticed being the Crown Gas Pump manufactured by the same company. The National Meter Company are to be congratulated upon having brought out so valuable a trade publication, and we feel that all who are favored with copies will fully appreciate them.

Lignum-vitæ has long been used on the stern tubes of steam vessels and for other bearings exposed to considerable pressure. M. Stockhardt, of Leipzig, Germany, however, has recently patented a process of treating ordinary soft wood, so as to be fit for those purposes for which lignum-vitæ has hitherto been almost exclusively used.

The Wheeler Can Opener.

This tool differs from most of the can openers in common use, in embodying the principle of a pair of shears. Its invention grew out of an actual want of the inventor, whose business required the sampling of canned good. In opening cans containing

The Wheeler Can Opener.

solids, such as corned beef, tongue, salmon, fowl, &c., it was found that the contents were usually extracted in a mutilated and unsatisfactory condition as well as with great annoyance in labor and fear of injury to the hand. Under these circumstances the inventor sought to produce a practical instrument for his own use, and the result is the can opener which is here-with illustrated. It is drop-forged, and is thus made wholly of steel, with a fine cutting blade, which is an integral part of the tool, and is not merely welded to the handle and easily broken off. In using this instrument the blade is inserted on the side of the can just below the can head, first, with the handle closed, then, relaxing the grasp of the hand until the blade is fully inserted, the handles are held out from the can, so that the jaw of the shears will come in contact with the tin at the cutting angle. The cutting then proceeds as with a pair of shears until the top of the can is detached, or as nearly so as desired. Square or round cans are cut with equal ease, and the solids are removed in perfect form for sampling or table use. A clean cut edge is left on the body of the can, while the tin above is forced to bend over the inner corner of the companion bar of the shear into the slot, thus making an open pathway and preventing the tin from binding on the blade. This tool is offered to the public at the lowest price possible by the inventor, E. A. Wheeler, 922 Farnam street, Omaha, Neb.

The Peabody Door Spring.

The accompanying illustration represents the Peabody Door Spring, manufactured by A. W. Paine, Peabody, Mass.,

The Peabody Door Spring.

showing it in use attached to the door. The spring is described as consisting of Bessemer-steel spring wire 3 feet long. At one end a right angle is turned, with an arm $5\frac{1}{4}$ inches, to the end of which another piece of wire, 5 inches, is connected by a

rivet, which forms a hinge. On the free end of this piece a hook is turned which fastens into a screw eye in the casing over the door $\frac{1}{4}$ inch from the angle in the spring. As indicated in the illustration, the spring is placed on the door parallel with the hinges and about 3 inches from the same. The spring is so placed that

the arm works freely over the top of the door. The requisite power for closing the door is obtained from the torsion of the wire, which is got by turning the wire round in the socket toward the hinges as far as is desirable and placing the wedge in the socket, when, bringing the arm around and hooking it into the eye, the spring is ready for use. It is explained that the leverage obtained by the arm of the spring is greater at the latch than at any other point, so that the door is closed slowly until it is nearly shut, thus avoid-

ing to a great extent the slamming of the door. The advantage of this article over other low-priced springs is thus alluded to. The spring is referred to as desirable for screen doors, as it can be very easily unhooked and the door put away. Its adaptation for other doors is also referred to. The springs are japanned and packed 1 gross in a case. One set of fixtures is packed in a box with directions, and a dozen sets of fixtures in a larger box. Two sizes are made, No. 1 for screen and house doors and No. 2 for store and heavy doors. The prices at which the goods are sold are referred to in the Trade Report.

In our description last week of the Electric Patent Pruner, just put upon the market by the Mechanics Mfg. Company, New Bedford, Mass., we omitted to say that the frame of the pruner is made of malleable iron, the cutter being of cast steel. The point is specially made in regard to it that it can be worked in less space than other pruners, as there are no long arms to project and interfere with the branches, and that it can be worked at a greater distance, as the hook will allow the operator to hang it on the limb to be cut, the limb thus taking the weight and relieving the operator of what would naturally be hard work.

The appraisers' conference recently held in this city sustained the previous appraisements at this port of steel wire rods, and crop ends from steel slabs were decided to be properly dutiable at 45 per cent.

The Gem Pencil Sharpener.

This simple and ingenious machine is represented in the accompanying illustration and is manufactured by Gould & Cook, Leominster, Mass. It is operated by means of a crank attached to a gear which intermeshes with two small pinions, which it rotates rapidly in opposite directions; one of these revolves the pencil holder and the other the metal disk, with which it is connected by a shaft. This disk is covered by a circular piece of sandpaper held in place by a thumb screw and washer. The chuck holder through which the pencil passes in the operation of sharpening is made to swing laterally by pressing upon the tail piece attached to it, thus keeping the end of the pencil against the sandpaper until the work is done. The operation of sharpening a pencil is thus very simple. It is pushed through the chuck, the end pressed against the disk, as described, when a few revolutions of the crank give the pencil as long and tapering a point as may be desired. A package of one dozen sandpaper disks is put up with each machine, additional packages being furnished, if desired, at a trifling expense. The diameter of the disk is about 6 inches. The weight of the machine, when boxed and ready for shipment, is 7 pounds. The points made by

The Gem Pencil Sharpener.

the manufacturers in regard to this machine are the following: That it sharpens equally well both slate and lead pencils; that it does not break the leads; that it is simple and easy to operate; that a long or short point or bevel can be obtained without altering the machine; that the chuck for holding the pencil is automatic, adjusting itself to pencils of any ordinary size; that it is compact and simple in construction and costs but little to keep in good working order, as it has neither knives, files or belts to replace when dull or worn out, but simply a circular piece of ordinary sandpaper, which can be cut out by any one. The adaptation of the machine for school use or for office purposes is obvious.

Never in the history of the country, says a Nevada paper, has there been so dry a season as the present. Streams in Alpine County which in past years have carried a good head of water are now as dry as a powder-house, and the Carson River has less water than ever was known at this time of the year. The loss to the mining interests and every one dependent upon river water for either motive power or irrigation is beyond compensation.

A syndicate of Northern and Southern gentlemen have closed a contract with the Cartersville Land Company and the Cartersville Furnace Company, at Cartersville, Ga., wherein they agree to erect an iron furnace and a ferromanganese furnace, to which they will apply the Pratt process for dephosphorizing the ores used.

The Canning Industry.

The vast importance of the canning industry of this country is fully realized by those only who are in some way connected with it. The fruit raisers and farmers who supply vegetable products to the canners appreciate in a measure the extent of the industry on which they depend, and some tin-plate importers are happily aware of the fact that large quantities of bright plates are annually consumed in the manufacture of cans. But from the general public the industry receives little attention. People buy and eat canned fruits, vegetables, meats and fish, foreign armies and navies are supplied with food packed in American canneries, and in every country of the globe the American traveler may glut his patriotism on eatables put up in the States. When

to have the largest and best equipped packing-houses, besides furnishing machinery to packers all over the country. Though California at present does not rank among the foremost States in this industry it is advancing rapidly, owing to its enormous and increasing production of fruits. We do not know whether this list includes the great meat-canning houses of Chicago and the West, but we should think that it would be in such establishments, rather than in those of Maine, that the best equipment and the most approved methods would be found.

Acme Evaporators.

The Steam Heat Evaporator Company, Charlotte, Mich., offer to the trade several forms of fruit dryers, or evaporators, two of which are illustrated in the cuts here-

illustration, all the fruit trays are readily accessible, and can be seen and reached from the floor without shifting. The arrangement of pipes is said to give a perfectly uniform degree of heat and an absolute immunity from danger from fire is claimed. The apparatus is very simple, and its capacity can be readily increased by the addition of steam coils. A final claim made by the manufacturers is that the fruit dried by this process is greatly superior to that dried by the hot-air process. In Fig. 2 a general illustration is shown of the No. 3 Acme Evaporator. The peculiarity of this apparatus is that no boiler is required. Its dimensions are 8 feet 2 inches high, 7 feet 3 inches wide, 9 feet 4 inches long; shaft, 16 x 16 inches; weight, 3400 pounds, and capacity from 70 to 190 bushels of apples in 24 hours.

Fig. 1.—No. 9 Acme Steam Evaporator.

we thus consider the world-wide distribution of canned goods and the enormous quantities that are consumed at home and abroad, a general statement of the number of canneries in the United States will not cause the surprise it otherwise would. We regret not being able to present a list giving the number and location by States of all the canning establishments in the country, but unfortunately accurate statistics of the industry are not obtainable. In the absence of exact official information, however, it may be of interest to give some figures from a table that appeared in a New England paper not long since. According to this statement there are 1350 packing-houses in the United States, but from other sources we learn that the actual number is probably not so great, though the statement may refer to all kinds of packing-houses. In the classification by States Maryland is far in the lead, being credited with 634 establishments, of which 127 are in Baltimore alone. Maine follows with 134, then New York with 127, after which come Michigan, California, New Jersey, Ohio, Oregon, Massachusetts and Delaware, in the order named, each of which has over 30 such factories. Maine is said

with given. Fig. 1 shows their No. 9 Acme Steam Evaporator. The apparatus is 9 feet 4 inches long, 8 feet 6 inches wide, 8 feet high, and weighs 6600 pounds, with a guaranteed capacity of 250 bushels of apples per 24 hours. For operating this apparatus it is recommended that boilers of not less than 15 horse-power be used. The apparatus consists of a succession of steam chambers constructed of steam-pipes, placed one above the other, room being left between them for the introduction of the galvanized wire fruit trays. The condensed water from the steam-pipes is returned to the boiler by means of a return steam trap, which is provided with the machine. The trap returns the water hot to the boiler, thus economizing the heat as much as possible. The manufacturers make reference to the fact that as the water is used over and over again, instead of fresh supplies being provided, there is little danger of boiler scale forming. A special feature to which attention is directed is the comparatively small size of this apparatus and its relatively large capacity. Whenever desired, one-half of the machine can be used at a time, the other half being disconnected. As will be noticed by reference to the

As shown in the illustrations the furnace is at the side, but, as at present manufactured, the apparatus has the furnace at the end. The heating is done with hot water, the heat from the furnace passing through the fruit in such a manner as to carry away the moisture without the danger of scorching the fruit. It has 14 hot-water chambers made of steel thoroughly stayed, which are steam and water tight, and, it is said, ought to last indefinitely. These chambers are filled with hot water by a continuous current of even pressure which imparts a uniform heat and secures even drying. They are placed at considerable distances one above the other, and the whole is inclosed in a shell as shown in the illustration. In both sides of this shell are doors through which the fruit trays are inserted upon ways or slides, each tray by itself. Within the furnace (underneath) is a large coil of iron pipe which heats the circulating water. The reservoir connected with the lower portion of the coil keeps the chamber filled with water. As the moisture is expelled from the fruit it is carried away without coming in contact with other fruit, and it is pointed out, furthermore, that the heat is applied both at top and bottom, so that the fruit is dried on

both sides simultaneously. When in use there is a constant flow of vapor through the drying chambers into the space between the tiers, and then up through the hood and flue above it. It is said that no moisture escapes into the room during the operation. The furnace is of an improved pattern, adapted to either coal or wood, and is said to be carefully secured against cracking. The trays are of galvanized wire cloth. A relief pipe is provided which carries away any steam that may be formed and also prevents the possibility of any pressure. While the machine is adapted for all kinds of work, it is especially recommended for drying berries and small fruits. The merits of this apparatus are

cost in the neighborhood of \$700,000 and an effort will be made to complete it within 15 months. This move means the development of an enormous water power and will result in making the Soo a manufacturing city of considerable importance in a short time. Letters of inquiry are being received from manufacturers and 1000 horse-power has already been contracted for. The canal will be three miles long.

Hammers and Anvils.

Prof. F. Kick has published in the *Technische Blätter* an interesting account

of the experiments he has made on this subject. The difference between static pressure and that which results from a shock consists, he says, in the duration of their action. The weight of the hammer and the height of the fall determine the total energy expended, but the power of the shock for a given expenditure of energy itself depends on the compression produced in the object struck. The feebleness of this compression is the greater the relative force of the blow to the pile. He has made some comparative experiments between the effects produced by an ordinary pile-driver striking upon an anvil solidly fixed, and by a ballistic hammer, where the driver and anvil are both suspended like pendulums, so that the anvil is free to move. He has found that within rather large limits the work employed in the deformation of an object under the action of the shock only depends upon the product of the weight of the driver and the height of the fall for

heights varying from 0.50 to 3 m. The test pieces were small copper cylinders, fitted on to the same rod, and of the same initial dimensions, 16.9 mm. long, 12 mm. in diameter, and weighing 18.4 grams. One of the series was submitted to the action of an ordinary driver, and the other to that of a ballistic driver, taking care to obtain equal shocks under the two conditions. The weight of the anvil of the ballistic driver was to that of the driver in the proportion of two to one. The experiments have shown that a greater deformation is obtained by the ordinary than by the ballistic drivers, all other things being equal. With the latter a calculation of the proportion of force transmitted to it can easily be made, and it was found that 30 per cent. of energy was expended. Other experiments made with the same apparatus have enabled the necessary energy of both to be determined on analogous *eprouvettes*. It was found that the ordinary driver expends seven and the ballistic driver nine. On the other hand, the latter provided with an anvil, the weight of which was equal to four times that of the driver, gave the same results as an ordinary driver with an anvil firmly fixed, and the weight of which was equal to 20 times that of the hammer. Test-pieces, as nearly as possible like those made use of in the preceding experiments, both as to quality and dimensions, have been tested by Professor Golinier's machine for testing metals, and the work necessary for obtaining a certain compression has been compared with that of a shock susceptible of giving the same results. The relation of the latter to the former is about 1.5. But this value varies according to the case, and increases for very hard materials and with the number of the blows. Mr. Kick estimates that the weight that should be adopted for anvils on which iron is to be forged should be at least eight times that of the hammer, and for steel 12 times. He considers that the anvil absorbs at least 20 per cent. of the force produced, and that the rest is lost in vibrations of the anvil and of the hammer and in the elevation of the temperature of the object to be forged.

Cost of Draft in Locomotive Boilers.

—In an article on the cost of draft in a locomotive boiler, the *Railway Master Mechanic* assumes that, because "it is not uncommon to have a back pressure in a locomotive cylinder of 7 pounds per square inch, the unnecessary, or rather undesirable, loss due to the compulsory back pressure to blow the fires" is the whole of this 7 pounds, and calculates as follows: "We will assume an 18 x 24 inch locomotive to be running at 50 miles per hour; the driving-wheels to be 5½ feet in diameter; the revolutions per mile, including slippage, to be about 300; the revolutions per minute to be $50 \times 300 \div 60 = 250$; and the piston speed in feet per minute to be $250 \times 8 = 2000$ feet for both cylinders. During this 2000 feet the piston is working 1½ feet for each 2 feet against 7 pounds pressure per square inch. That is equal to three-fourths of the distance, or 1500 feet. The area of an 18-inch piston is 254 square inches; the horse-power is then $254 \times 7 \times 1500 \div 33,000 = 80$ horse-power. This is only an approximation to the average case, yet it is the condition under which many locomotives work."

The contract for the construction of the new naval observatory on Georgetown Heights has been awarded to P. H. McLaughlin & Co., of Washington, at their bid of \$307,811. This is exclusive of domes and piers, which will be constructed by the Government. The building is to be completed within 18 months, and is to be constructed of Tuckahoe marble.

Fig. 2.—No. 3 Acme Evaporator.

referred to in a number of letters from those who have used it with the most satisfactory results.

The Sault Ste. Marie Water-Power Canal.—At a citizens' mass meeting held at Sault Ste. Marie, Mich., on the 3d inst., \$12,000, the remainder of the sum necessary to insure the commencement of work upon the great water-power canal, was raised. This makes \$100,000 raised by the citizens of Sault Ste. Marie, for which they receive from the water-power company \$200,000 in stock. The company agree to put up a like amount and to begin the work of construction within 20 days. The plans and specifications for the canal are now in the hands of the contractors, and as the water-power people were only awaiting the result of the Soo's endeavor to secure the sum required, there will be no delay in beginning the work and pushing it on to completion. The canal will

be three miles long. The cost in the neighborhood of \$700,000 and an effort will be made to complete it within 15 months. This move means the development of an enormous water power and will result in making the Soo a manufacturing city of considerable importance in a short time. Letters of inquiry are being received from manufacturers and 1000 horse-power has already been contracted for. The canal will be three miles long.
